Tin.—Business in tin has been almost wholly absent. Prices have receded slightly on nearby positions, but sellers are disposed to hold forward deliveries firmly. The situation

in the metal has undergone no startling change in the past few weeks. Consumers as a rule are well covered over August and September by supplies already in hand, while the large users have large contracts against fourth quarter needs. The statistics for July showed the total visible supply on July 31 to be 18,404 tons, a decline of 959 tons from the visible supply on June 30. The deliveries in July totaled 1432 tons, while the stocks in landing amounted to 5028 tons. The detailed statistics showed Straits shipments of 5410 tons, of which 2530 tons are for the United States. The arrival of the steamer *Radja* with 1100 tons Banka tin unsettled the market, as this steamer was not expected until late in August. Spot Straits tin is offered at 37½ cts., with spot Banka held at 36½ cts. Straits for late August delivery is quoted at 37½ cts. and September at 37½ cts. For October arrival sellers ask 37¼ cts., with November held at 37½ cts. and December at 37 cts.

Foreign markets were inclined to be easier on the absence of orders from this side. English sellers, however, are inclined to be optimistic in view of the extensive reduction in stocks of Bolivian ores held in the Kingdom and also on the greater consumption in this country, which offsets the smaller absorption abroad. Price changes were of a minor character and without special influence.

Quotations for tin per pound at New York and per ton at London and Singapore for the week ended Aug. 9 were as follows:

Lead.—Late last week the American Smelting & Refining Co. announced a reduction of \$10 a ton in its official price for lead. The change had been anticipated and was immediately met by independents. The market following the cut was weak and very dull and there is little prospect of an early revival in demand. Foreign buyers who were in evidence during July have covered their needs, while domestic consumers, especially munition makers, showed no interest in the metal.

Sellers in the outside market were offering up to November delivery at 5.70 cts. St. Louis, with spot held at 5.95 cts. New York and 5.825 cts. St. Louis. The new quotations of the American Smelting & Refining Co. are 6 cts. New York and 5.925 cts. St. Louis. The average price during July of the leading interest was 6.50 cts. in New York and 6.425 cts. at St. Louis. It is stated that some business for October was done at 5.85 cts. St. Louis before the reduction in the official price, but sellers now report that consumers are looking for still lower quotations.

The London market, after holding unchanged for a number of days, has begun to advance, but the upward movement is small. Spot and futures gained 5s on Monday.

Quotations for lead per pound at New York and per ton at London for the week ended Aug. 9 were as follows:

Lead Ore.—During the week ended Aug. 5 no hopes for a better ore market was noted in the Missouri-Kansas-Oklahoma district and the price was again down \$5 and \$65 was the prevailing price paid for ores, though some few lots went as high as \$67. Production was also off a little and there were produced 1,594,330 lbs. of concentrates in the district during the week. This brought the total for the year to 64,370,542 lbs. The production for the week was valued at \$5,728 and that for the year at \$2,792,199.

Zinc Ore.—In the Missouri-Kansas-Oklahoma district it is said that many of the furnaces which have no advance orders are closing down because they can not produce at a profit under prevailing prices. Ore in the district again dropped \$5 and the top price for the week ended Aug. 5 was \$70, this price ranging down to \$50. During the week there were produced in the district 7,474,110 lbs. of concentrates and during the year to that date 40,279,354 lbs. The values for these amounts were given at \$224,155 and \$18,863,423 respectively.

Calamine.—As with the other ores calamine was down \$5 and sold from \$35 to \$45. There were produced 243,100 lbs. of concentrates, making the production for the year 19,403,520 lbs., and these amounts were valued at \$4913 and \$712,665.

MONTHLY AVERAGE PRICES OF JOPLIN ZINC ORE.

Month.	1916			1915.
	High.	Low.	Average.	Average.

Year				102.95

Spelter.—The market has been almost featureless. Sellers state business has been lacking and that consumers have not been interested in offers. The government statistics covering production over the first half of the year, and announced this week, were considered bullish, and some factors believe they may be the basis for an improved demand. It is reported that the supply in the first half totaled 330,922 tons, while the apparent consumption was 228,718 tons. Sellers offered for November and December at 7¼ cts., while for spot 8½ cts. New York and 8¼ cts. St. Louis were quoted.

Galvanizers who were disposed to buy at the recent upturn have latterly displayed no interest, although the asking price of sellers has been only 2 cts. above what is con-

sidered normal. At London the market opened the week with a sharp decline, carrying spot down £3 to £44 and futures £2 to £40.

Quotations for spelter per pound at New York and per ton at London for the week ended Aug. 9 were as follows:

MISCELLANEOUS METALS.

Quicksilver.—On a general absence of demand prices have again declined, with quotations of several of the large sellers varying to the extent of \$2 a flask. On Monday of this week one of the important sellers lowered its price to \$75 per flask, but others still asked \$77 per flask. There are some powder interests in the market for about 6 cars for late August delivery, and it is understood that these buyers have offered \$73 per flask. The market, while quiet and declining, cannot be considered weak. Prices have reached buyers' views, and with the balance restored it is likely that some very active business may soon be done.

Antimony.—Dealers in Asiatic metal continue to compete actively for business, with the result that price concessions are visible. Thus while 11 cts. is quoted for spot in store it is known that consumers have been quietly offered at 10 cts. For the fourth quarter offers of Chinese antimony at 9 cts. duty paid are reported to have been made. The situation in this metal reflects the after effect of overproduction stimulated by high prices. Some of the new producers are having a hard time to cover expenses. Whether antimony will ever return above 20 cts. is problematical.

Aluminum.—Second hands have been offering spot ingots at concessions, with the demand very dull. Resellers have asked 55 cts. for spot virgin ingots, while first hands are quoting 57@59 cts. per pound in ton lots. No. 1 remelted is held at 56@58 cts. and No. 12 alloy at 46@48 cts. Automobile makers have not been buyers recently. Sheet aluminum has been quite active, with dealers reporting a scarcity of supplies. Small lots have been sold at \$80 to \$100 per 100 lbs., while special material is held at \$90 to \$100.

Finished Copper, Brass and Other Products.—There has been a revision of prices on copper and lead sheets, makers reducing quotations. Demand for copper products has been fair, but lead and zinc sheets are dull. Brass products hold fairly steady, but are inclined to be quiet. The following prices are all f. o. b. mill:

Sheet zinc	\$15.00@
Sheet aluminum, 1917 contract	40.00@
Sheet aluminum, outside market, prompt shipment	80.00@95.00
Copper wire	29.00@32.00
Sheet copper, hot rolled	35.50@
Sheet copper, cold rolled	36.50@
High brass sheet, wire and rods	38.00@39.50
Low brass sheet, wire and rods	39.50@42.00
Bronze sheet and wire	40.00@42.00
Bronze rods	40.00@42.00
Brazed brass tubing	45.00@46.50
Brazed bronze tubing	46.00@47.00
Seamless copper tubing	43.00@44.00
Seamless brass tubing	42.00@43.00
Seamless bronze tubing	43.00@44.00
Full lead sheets	8.25@
Cut lead sheets	8.50@

Pig Iron.—While domestic demand continues to be the minor factor in the pig iron market, much interest was displayed in an inquiry put out by the International Steam Pump Co. for 6000 tons foundry grades for delivery in the first half of next year. It is expected that when domestic users do resume buying that a considerable tonnage will be booked for delivery next year. Foreign demand continues quite large, inquiries now in the market amounting to about 20,000 tons. Prices on steel making and foundry grades show no change.

The Function of Oil and Acid in Flotation

By H. J. STANDER.*

If one wishes to closely observe the behavior of particles of oil, air and sulphides, while they are in an agitated quantity of water, it is highly essential to carry out the experiment in a machine which has one of its sides constructed out of glass. The experiments described in this article were carried out in a testing machine, built on the style of the Minerals Separation machine, having glass fronts to both the agitating chamber and the spitzkasten box.

When the two boxes are filled with water, and the agitator run at a speed of about 1800 rpm., one can see, by looking through the glass front, a certain number of air bubbles. These bubbles have been beaten into the water in the agitating chamber, and are now passing into the spitzkasten, having enough momentum to travel downwards along the baffle plate until they are released at the end of the plate. The baffle plate in this machine points downwards. As soon as the air bubbles get around the lower end of the baffle plate, they, of course, rise to the surface of the water in the spitzkasten.

Even when the agitator is run at full speed, which is 2400 rpm., the number of air particles coming from the agitating chamber is not sufficient to cause any noticeable change in the appearance of the water in the spitzkasten box. One can detect a limited quantity of these bubbles as they come round the baffle plate and rise to the surface of the water in the collecting chamber.

On the addition of one drop of oil, such as creosote, eucalyptus or pine oil, to the water in the agitating chamber, the number of air bubbles is increased to such an extent that the water in the spitzkasten becomes perfectly white. It is of course not the water that changes in color, but this white appearance is due to the fact that we now have an infinitesimal amount of exceedingly small particles of air intermingled with the water in the collecting chamber. In other words, we may say that an emulsion has been formed; and the change in the appearance and quantity of air bub-

bles, due to the addition of about 0.02% of oil, is indeed a very remarkable one. It is possible to get an estimate of what an oil will do in flotation by noting to what extent it increases the number of air bubbles in the machine, or, to use a colloquial expression, by seeing to what degree it "whitens up" the water in the spitzkasten.

Although the process of concentrating ores by the flotation method is usually spoken of as "oil flotation," we know that an oil is not the only substance that will form a froth with sulphide particles. On the addition of certain organic substances, I have obtained an exceedingly high percentage of extraction of sulphide particles. Experiments were made without oil, using such organic substances as froth makers. Not only did they produce a very good effect on the air bubbles, by increasing the number of bubbles when added to the agitated water, but they also formed excellent froths with ores carrying sulphides. The following is a table of the results of some of the more common of the substances:

Volume of solution used.	Emulsifying agent.	Pct. of emul. agent in sol.	Pct. of sulphide extracted.
4500 cc.	Amyl. Acetate	0.02	60
4500 cc.	Pyridin	0.04	45
4500 cc.	Toludin	0.05	35
4500 cc.	Carbon tetra-chloride	0.1	30
4500 cc.	Ether	0.1	30

Experiments were also carried out with acetone, toluol, chloroform, formaldehyde, oil anilin, cymol, geraniol, etc.

From the above it seems as if any substance which is an emulsifying agent, i. e., will cause the air bubbles in the water (produced either by pneumatic or mechanical agitation) to increase in number and decrease in size, is capable of forming a froth with the metallic particles.

A very interesting experiment is to take a small scoop, place some finely ground galena in it, and allow a small quantity of water to flow slowly on to it. Keeping the scoop in a tilted position for some time, and then lowering the front end so that the water can run off, it will be found that as the water runs back off the galena, its surface is covered with dry sul-

*Flotation Engineer.

phide particles, while the galena that is left behind in the scoop will be perfectly dry. The water finds great difficulty to wet the galena, because as soon as it comes in contact with the top layer of the sulphides, the surface of the water becomes completely covered with very fine sulphide particles. Furthermore, as the water is allowed to flow over the galena, it gets an envelope of sulphides all around itself, and these sulphides lie so closely together on the surface of the water that when looked at under a microscope they seem to form a complete film without any breaks. The angle of contact of the sulphide particle and the water surface is such that the particle does not pierce the water surface, but rather floats on or adheres to it. Also it appears as if the sulphide particles are totally non-porous, absorbing apparently no water.

If this experiment is done with silica instead of galena, one will see that the water is at once absorbed into the silica particle, and the water fills up all the pores in the particle, during which action the surface of the water is naturally pierced, with the result that the silica sinks into the water. If a paste of finely ground galena and water is formed, and water is allowed to flow slowly over the surface of this paste, one notices that, even under these conditions, when the galena is practically "wet," the water surface becomes coated with a fine, but consistent layer of galena particles. This experiment can be done in a beaker; and although one shakes the beaker quite violently, the water will always carry a layer of metallic particles.

But what is even more interesting in the above experiment, is that as the beaker, with its contents of galena and water, is shaken up, the bubbles of air, which are shaken into the water, come to the surface of the water with a slight covering of a very fine film of galena particles. This, however, applies only to the smallest of the air bubbles. The air bubble, as it is shaken into the water, is surrounded by water, with the result that we have again a water surface bounded by an air surface, producing an interfacial tension of water and air; and the surface which now separates the two phases is a foam interface. The fine sulphide particles tend to stay in such a water-air interface. Blowing very small air bubbles through a glass tube, which has been drawn out to a small aperture, into the water in the beaker, the above-stated action of the galena particles can be seen to an even greater advantage. If the bubbles blown in are too big they will carry very little or no sulphides, because the exposed bubble surface is very small as compared with that when a very large number of fine bubbles are blown into the water. The smaller the air bubble, as it passes through the water containing the sulphide particles in suspension, (as a result of the agitation) the better chance the sulphides have to form a complete film on the water surface, which surrounds this bubble; or, in other words, in the spherical water-air interface. This explains in part why the air, in the case of pneumatic agitation, should be passed through a fairly thick canvas screen.

It will then appear that when air bubbles are either beaten or forced into a quantity of water, and a small amount of some particular foreign substance be added to the water, the bubbles seem to decrease in size and increase in number to an almost unlimited extent. For instance, such is the case when a drop of eucalyptus oil or ether is added to the water. The interfacial tension between the water and air phases is decreased on the introduction of an emulsifying agent. Such an emulsifying agent must have the property of tending to enter the water-air interface. Wilder D. Bancroft has written a series of articles on "The Theory of Emulsification," published in the *Journal of Physical Chemistry*, out of which very useful data with regard to the characteristics of an emulsifying agent, can be obtained. His article in the April number, 1915, is of special interest, inasmuch as quite a number of very useful experiments are cited. He says:¹ "For a substance to be an emulsifying agent, it must tend to pass into the surface separating the two liquids and form a coherent film there. If the emulsifying agent does not form a coherent film the emulsion will crack."

When two liquids, which are practically immiscible, come together we have a surface that separates these two liquid phases, and this surface is called a dineric² interface. In order to fully understand the water-air interface, it may be of value to study a case where we have a dineric interface. The following extract from Wilson's³ account of an experiment which he carried out as early as 1848, will serve the purpose as well as any:

"When chloroform is placed in a test-tube, or other vessel of glass, standing on a horizontal surface, it exhibits, like other substances which wet that solid, a curved surface with the concavity upwards. If water, or an aqueous solution of nitric, sulphuric, or muriatic acid, be poured upon the stratum of chloroform, the surface of the latter immediately changes the direction of its curve, and becomes convex upwards, the convexity induced being much greater, however, than the previous concavity. If, on the other hand, an aqueous solution of potash, soda, or ammonia be placed above the chloroform, the latter ceases at its upper limit to present a sensible curvature upwards or downwards, and shows a surface which, to an unassisted eye, appears to be flat. It is the property of an acid to round, and of an alkali to flatten the surface of various liquids, of which chloroform is one, that I seek specially to direct attention.

"The phenomena referred to cannot seem remarkable when merely described; but they have appeared strikingly, and, I may say, startling to most of those that have witnessed them. They are best observed by dropping into a perfectly clear, flat-bottomed glass vessel containing pure water, a quantity of chloroform too small in amount to touch the walls of the vessel on every side. The heavier liquid then shows itself

¹Bancroft: *Jour. Phys. Chem.*, 19, 275 (1915).

²De I.: *Jour. Phys. Chem.*, 9, 531 (1905).

³*Jour. Chem. Soc.*, 1, 174 (1848).

as a brilliant highly-mobile globule. If alkali be now added, the globule in a moment collapses, sinks as if exposed to a crushing force, and flattens out on the bottom of the glass. On slightly supersaturating the alkali with acid, the flattened chloroform starts into its previous globular shape, with a momentum and rapidity, such as might be exhibited by a highly-elastic substance, like a ball of caoutchouc suddenly relieved from enormous pressure. When the acid in its turn is supersaturated with alkali, and the flattening again occurs, and by alternating the addition of these reagents, the same globule may be successfully flattened and rounded for any number of times.

"Change in configuration, however, is not the only alteration which the globule of chloroform undergoes. Some of the other physical properties are markedly altered by its contact with acids and alkalis. These changes are best seen when a deep, white saucer, or flat-bottomed porcelain basin, is made use of as the containing vessel. When acidulated water is placed in this, and chloroform let fall into it, the denser fluid is scarcely wetted, and although nearly half as heavy again as pure water, sinks reluctantly. If the drops indeed be small, they never reach the bottom, but on floating on the surface, evaporate away. Those which descend form globules very mobile, and readily obeying the solicitation of gravity. When separate globules melt, they rapidly flow together, and scarcely one is seen without a bubble of air attached to its upper surface and adhering tenaciously. When the water, on the other hand, is alkali, the chloroform is quickly wetted, and sinks swiftly. The drops, if small, become circular discs with rounded edges; if large, they are oval, or spread out into elongated, irregularly ovoidal, or flattened cylindrical forms. Their shape, however, is changed by the slightest impulse, or inclination of the containing vessel, in a way, which perhaps might best be illustrated by comparing it to the ever-varying elongation, contractions and irregular swellings, which alter the configuration of an active living leech in a glass of water. The flattened globule moreover, is much less mobile than the rounded one in acid. The former moves sluggishly, even down an inclination, clings to the vessel; and when compelled to move rapidly leaves a tail behind it, like foul mercury. No air bells attach themselves to it and its brilliancy is sensibly diminished, as if its refractive index had altered."

From this experiment we can very clearly see how the interface changes in shape when an acid or alkali is added to the system. The interfacial tension is markedly altered in both cases. In the flotation process, the emulsifying agent alters, in the same way, the interfacial tension existing between the surface of the water and the air bubble. The result is that the metallic sulphide particles find it even more difficult to pierce the water-air interface, than when there is no emulsifying agent to make a more coherent film. Thus the oil will make it possible for a larger number of sulphides to adhere to this, usually spherical, film.

As previously stated, the surface tension of the water decreases on the addition of small quantities of such substances as ether, chloroform or oil. This decrease in surface tension then brings about a decrease in the size of the air bubble. The air bubble will tend to leave the liquid when the surface tension of the liquid increases; in other words, the air will form in larger bubbles, and the opposite of course happens when the surface tension of the liquid decreases. The oil is responsible for such a decrease in the surface tension of the liquid, but it performs another duty apart from this.

The sulphide particles cannot be given an oil coating as the amount of oil added is too minute. In practice the amount of oil in the solution is usually only 0.05%. That a molecular oil-film is formed around the metallic particles, is possible, but as yet we are not capable of discussing this particular point.

To form an emulsion, we do not need enough of the emulsifying agent to form a real film of it between the liquid and gas phases; on the contrary, only so much of it is required as to bring about the desired change in the surface tension of the liquid, and to make the interfacial film more coherent. When one closely observes the change that takes place in the agitated water on the addition of about 0.01% of oil, such as eucalyptus, pine oil or creosote, it can clearly be seen that the added oil produces an emulsifying effect. This cannot be noticed in the mill, or when a large amount of ore is added to the agitated water before the oil is added. The emulsion under such conditions is partly broken down, yet we get the same results from the emulsifying effect of the oil. Differences in the emulsifying effect of different oils will make it possible to get a difference in the so-called selective action of the oil.

Various properties of a solution are changed by the addition of an alkali or acid. It is quite possible to conceive that the interfacial film changes in its properties, as the liquid is made alkaline or acidic. It is well known that a more selective action in flotation is brought about by the help of an acid. A more selective action really means that the ability of the air or gas bubbles to attach themselves to, or carry, the gangue particles, decreases to such an extent that the silica finds it totally impossible to rise to the surface of the liquid. Experiments show that although the concentrate carries less gangue, yet the recovery of sulphides is not so high as when without acid.

This is further proof that the air bubbles decrease in their carrying ability when the solution is made acidic; in other words, a change has been brought about in the water-air boundary. That this effect is confined to the interfacial tension, and the coherent property of this interface is not probable, especially when the electrical theory is given any consideration.

An emulsion is usually interpreted as drops of one liquid suspended in another liquid, these drops being kept in some way or other from coalescing. Whether

it is possible to have an emulsion of a liquid, a gas and a foreign liquid, is a matter worth our attention.

The term "emulsion" has been freely used in this article. I have failed to find any term other than emulsion to suitably describe the phenomenon which takes place when an infinite number of air particles are being released in a quantity of water containing, say, 0.01% pine oil.

When considering the change in size of the air bubbles brought about by the addition of those foreign substances, to which I referred as emulsifying agents, it is of importance to remember that the more convex the surface film, the greater will be its resistance to outside forces. As the air particle gets smaller, its spherical surface film naturally gets more and more convex, with the result that its resisting power to any force that may tend to pierce it, also increases. This gives us another reason why it is that the smaller the air bubble, the better collector of sulphides does it become. The large bubbles of air, which are very often seen on the top of a froth, should not be confused with these "collecting" air bubbles. The former are in the froth medium, and practically out of contact with the water; while in the case of the latter we have a water-air interface which is of prime importance in the raising of the metallic sulphide particles.

A Novel Ingot Mold.

In this class of molds, known as "big-end-up" molds, where the mold is solid or not made in sections as is sometimes done, the ingot is stripped from the mold by either being raised or pushed out of the mold,

SECTIONAL VIEW OF INGOT MOLD.

or the mold is reversed and the ingot dropped out. If the molten metal leaks from the bottom of the mold in such a manner as to form a lateral fin at the inner end of the ingot, the stripping of the ingot is prevented

or impeded, furthermore if the walls of the mold cavity are not properly formed what are known as "stickers" are formed on the ingot which prevent or impede the stripping operation. It is quite important that the mold cavity should be free from re-entrant angles which tend to impede the stripping operation.

In an ingot mold recently patented by Emil Gathmann, of Baltimore, Md., (No. 1,188,751), the bottom opening of the mold is preferably formed with walls which converge downwardly, and the walls of the lower portion of the mold cavity are formed with rounded or convex walls surrounding the inner end of the bottom opening and which merge into the concaved walls of the lower portions of the mold. By this construction the presence or formation of re-entrant angles is prevented and the stripping of the ingot is facilitated.

Where the mold stool is provided with a projection which enters the bottom opening in the mold such projection is preferably tapered inwardly and sealing material of a refractory nature is spread upon the top of the stool and this material also enters the recess surrounding the inwardly projecting portion of the stool. In some cases the projection on the stool may be dispensed with and the refractory material is made to fill or partially fill the bottom opening of the mold.

The accompanying sectional view illustrates the points involved.

Insuluminum.

Insuluminum, the patented new metal with heat resisting qualities, will undoubtedly play an important part in the industrial development of the future. So satisfactory and indispensable has its use proved to the manufacturers of soot blowers and pyrometers that a demand has been created among the manufacturers of boilers, superheaters, economizers, stokers, annealing ovens, condensers, etc., for permission to use the material in those parts of their products that are exposed to continuous high temperatures, and arrangements are now being made by the licensees, the Diamond Power Specialty Co., whereby they may be supplied with the metal. Seldom has anything as revolutionary as insuluminum been accorded such a complete acceptance on its merits. Since its adoption the sales of Diamond Blowers have more than doubled in volume, and the company's estimate of sales for the year beginning Aug. 1, 1916, contemplates a further notable increase to a production to equip 1,000,000 hp. of boilers annually. Hundreds of successful applicants of Diamond Insuluminum soot blowers have been made in the hottest portions of the boilers in the past year.

The principal uses of benzol and its products are: As a motor fuel; to enrich illuminating gas; in the manufacture of aniline dyes; as a solvent for rubber and similar substances; in the manufacture of gunpowder.

2000-Ton Leaching Plant at Anaconda, Mont.

By FREDERICK LAIST* and HAROLD W. ALDRICH.†

After a series of experiments covering a period of about 3 years, a 2000-ton leaching plant for the treatment of the accumulated copper concentrator tailing was built and put into operation. During the experimental period, the first step was that of laboratory experiments or beaker leaches. The results on this small scale were so satisfactory that a small operating plant, capable of handling 5 tons of roasted tailings per day, was installed. Again, the results proved satisfactory and an 80-ton plant was built and operated continuously from August until February, 1913. In this plant, full-sized roasting and leaching units were used. The results obtained by the operation of the 80-ton plant proved that the roasting and leaching of delimed concentrator tailings could be profitably done, so in the early spring of 1914, the construction of a 2000-ton leaching plant was begun (Fig. 1). Opera-

tion of the plant began on May 13, 1915. A flow sheet of the plant is shown in Fig. 2.

Conveying and Storage Equipment.

The loaded cars of tailings are spotted by a 25-ton electric locomotive operated by the third-rail system. The unloading pit is a steel bin capable of holding 350 tons and is of sufficient length to allow 3 cars to be unloaded at a time. On top of the pit is a 2-in. grizzly, through which all tailings must pass before going to the storage bins. Under the steel bin are 22 short-belt feeders, each feeding from its own gate and running at right angles to the length of the bin. These feeders discharge onto a 36-in. belt running lengthwise, which in turn delivers the sand to another 36-in.

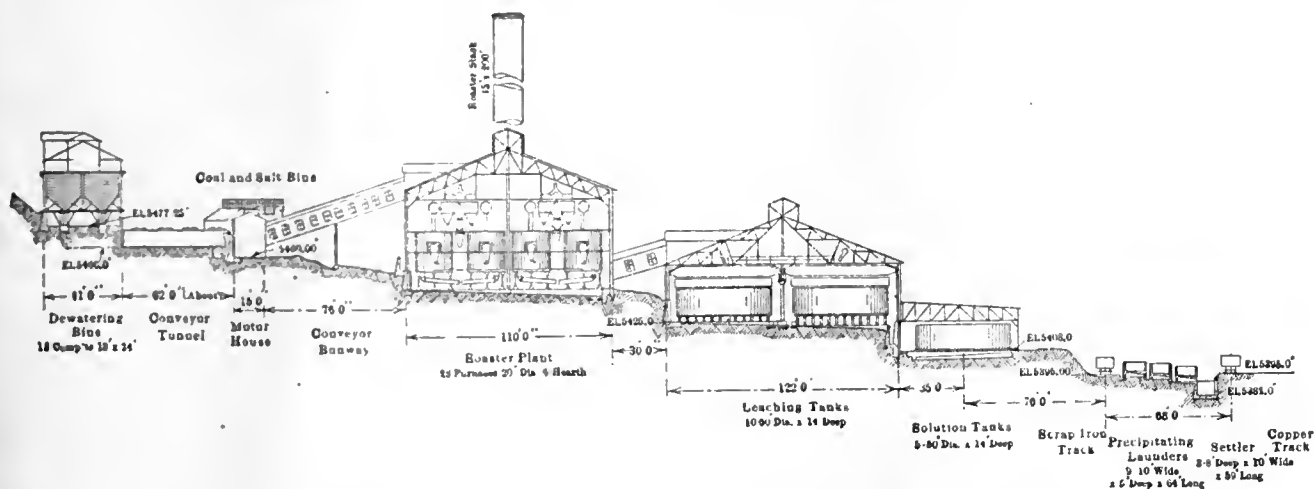

FIG. 1. GENERAL PROFILE OF 2000-TON LEACHING PLANT AT ANACONDA.

tion of the plant began on May 13, 1915. A flow sheet of the plant is shown in Fig. 2.

Leaching Plant Feed.

The accumulated tailings in the New Works dump is estimated at about 20,000,000 tons. The dump consists of the concentrator tailings discharge over a period extending from February, 1902, to the present date. According to daily samples taken during that period, the copper content is about 0.64% and the silver 0.48 oz. per ton. The peak of the dump, or the point where the tailings are discharged, carries about 0.75% copper, while down toward the toe, and where present excavation is taking place, the copper content is only 0.57%. About 3 lbs. per ton of the copper is oxidized, the remainder being sulphide.

The dump is being excavated by a Bay City Industrial Works electric hoist, equipped with a 4-yd.

belt traveling on an 18° angle to the top of the storage bins. The system will handle over 3000 tons of tailings in 8 hours.

Storage Bins.

The storage bins will hold 6000 tons. This gives between 2 and 3 days' supply for the leaching plant. The bins are of substantial wood construction and are inclosed, the walls and roof of the building consisting of wood sheathing covered with corrugated iron. The bins are arranged in a double row and are hopper-bottomed. The tailings are distributed over the bins by means of a 36-in. belt and movable tripper.

Underneath are 36 gates, each with its hopper from which an 18-in. belt feeder delivers to a 24-in. belt running the full length of the building in the center. By means of other belts, traveling through a tunnel under the railroad tracks, and up an 18° incline, the feed is delivered to the top of the furnace building.

There are also small coal and salt storage bins from which a 22-in. belt system conveys coal and salt

*Metallurgical Manager, Anaconda Mining Co.
 †Superintendent of Leaching Plant, Anaconda Mining Co.
 ‡Bull. American Institute of Mining Engineers.

to bins in the roaster building, the salt being drawn from there to the leaching building as it is required. All belts run at approximately 400 ft. per minute.

Roasting Equipment.

The furnace building is 232 by 110 ft. and is of steel and concrete construction (Fig. 3).

There are 28 McDougall-type 6-hearth furnaces arranged in four rows of seven each. The furnaces are 20 ft. in diameter, each being equipped with two fire boxes, diametrically opposite, the flame entering over a fire bridge directly into the third hearth, the top hearth being designated as the first. The grate dimensions of each fire box are 3 by 4 ft. (Fig. 4).

Each furnace has a 20-ton feed hopper, to which the tailings are delivered by two 24-in. belts each equipped with a movable tripper. The furnaces are fed by 14-in. belt feeders drawing from these hoppers, the amount of feed being controlled by gates which are operated by means of a screw adjustment, the feed dropping

connected to a 50-hp. motor. The air intake is at the top of the furnace shaft and the discharge at the bottom. The hot air does not enter the furnaces, but is delivered to the leaching and solution buildings for heating purposes by a suitable piping system. When it is not needed for this it is discharged into the atmosphere.

Each furnace is equipped with a cylindrical cooler, 30 ins. in diameter and 19 ft. long. The cooled calcine enters a mixer or concrete-lined steel cylinder, at the head end of which a very small stream of water is added to settle the dust. The mixer discharges a moist warm calcine to an 18-in. conveyor belt, and by a system of conveyors the calcine is delivered to the leaching building.

The ashes from the fire boxes drop into launders and are sluiced out through the main tail race.

Leaching Plant Equipment.

The leaching building is 293 by 122 ft. and is of steel and wood construction. It contains 10 redwood

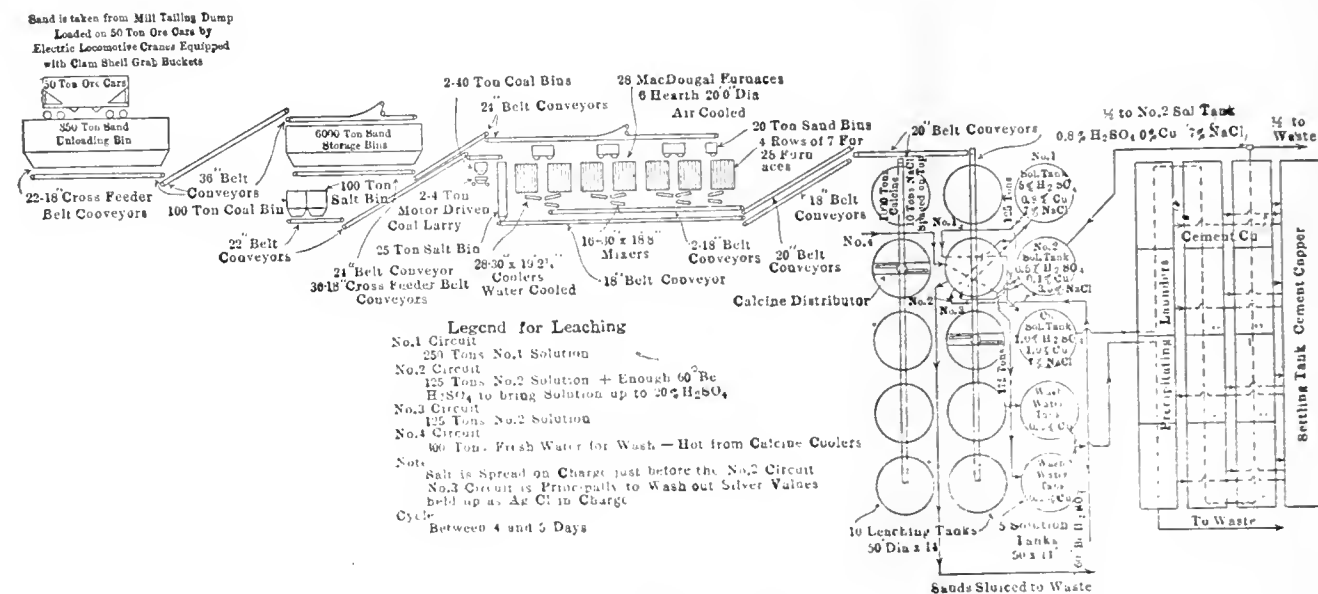

FIG. 2. FLOW SHEET OF LEACHING PLANT AT ANACONDA.

through a hole in the top arch, directly onto the top floor. During the time the feed is on the two upper floors, it is dried and heated; as it drops to the third or fired floor, the sulphur ignites. The three lower floors are kept hot by the combustion of the sulphur in the tailings.

Four flues run the length of the building, one over each row of seven furnaces. Each furnace has two opposite connections, from the top hearth to the flue. All four flues lead into a balloon flue with a downtake of 45°. The balloon flue enters the 15 by 200-ft. steel stack with a 45° uptake. The stack is unlined. In the bottom of the balloon flue is a 6-in. screw conveyor which delivers the flue dust to the belt-conveyor system which receives the calcine from the furnaces.

The furnaces are air-cooled, the air being furnished by four No. 11 Buffalo blowers each direct-

tanks each 50 ft. in diameter, and 14 ft. deep. The average charge to a tank is about 1000 tons of calcine.

The tanks are equipped with an ordinary filter bottom, made of 1¼-in. slats resting on 2 by 4-in. pieces. Above this are two layers of heavy cocoa matting and on top of the matting is a grating, made of 1¾ by 3½-in. material, with 6-in. sq. spaces. The grating fills with calcine 3½ ins. deep and serves to keep the force of the sluicing water from tearing the matting. The acid solutions rot the cocoa matting, but if not disturbed, it will hold its shape and be an efficient filtering medium long after it is too much decomposed to handle. All the steel tank hoops are covered with lead pipes to protect them against leaks of acid solutions.

The tanks are in two rows of five each. A 20-in. conveyor belt travels over each row, and by means of

a tripper, the calcine is dumped into a suitable distributor, which spreads it over the tank.

Each tank has three lead pipes 4 ins. in diameter and one 4-in. iron pipe entering at the top. The lead connections are for strong and dilute acid solutions and the iron pipe is for wash water. Above the level of the leaching tanks an iron storage tank is provided for holding the stock of concentrated acid. Its capacity is about 120 tons of 60° Bé. acid. All concentrated acid, used to raise the acid strength of any solution, is added to the solution as it goes on the charge in the leaching tanks.

There are seven 10-in. sluicing gates in the bottom of each leaching tank, one in the center and six spaced equidistant from each other in a circle about half way between the center and the circumference of the tank.

from the solution tanks, by means of vertical shaft, direct-connected, hard-lead, centrifugal pumps.

Precipitating Division.

The precipitation of the copper and silver is accomplished with scrap iron. The precipitating launders are of concrete, each about 250 ft. long and, having a section of 4 by 8 ft. available for containing iron. Each launder is partitioned off into four sections by concrete walls. Any of the 12 sections may be bypassed for the purpose of cleaning up. In the bottom of the launders is a heavy wood grating, upon which the iron rests, leaving a space about 6 ins. under it, for accumulation of any cement copper which may drop off the iron. In the side of each section, at the bottom, are four 6-in. holes, toward which the con-

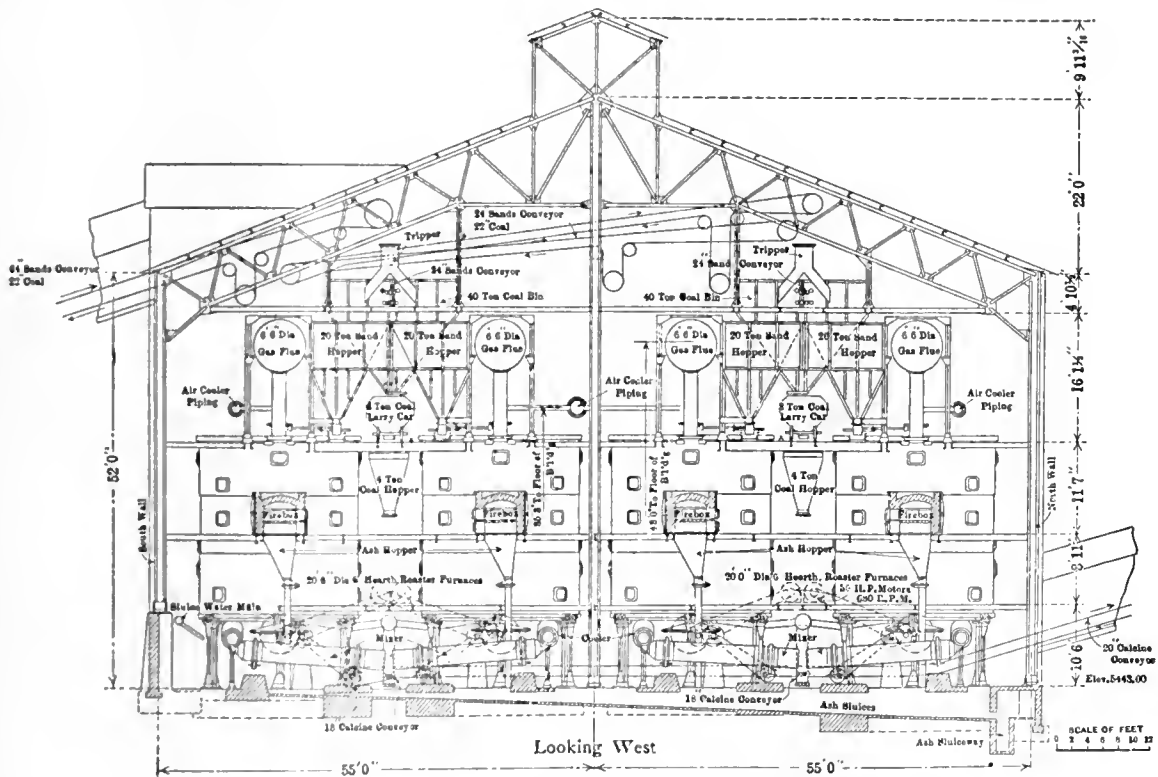

FIG. 3. CROSS SECTION THROUGH ANACONDA ROASTING PLANT.

These discharge into launders which connect with the main tailings launder.

"Acimet" valves and lead piping are used throughout for handling dilute and concentrated acid solutions.

The floors of both the leaching and solution buildings are of concrete, and are painted with an asphaltar mixture for acid proofing. These floors slope to a gutter which connects to a pump sump and in this way any overflow or leakage of solution is saved and returned to the system.

The solution tank building is a lean-to off the leaching building and contains five solution-storage tanks. These are 50 ft. in diameter and 14 ft. deep. Solutions drain from the leaching tanks to the storage tanks and are pumped to the top of the leaching tanks,

crete bottom slopes. These holes discharge into launders which carry the copper to a settling tank. There it is washed and stored and finally excavated with a clamshell bucket, loaded into standard railroad cars and, at present, shipped to the briquetting plant before blast-furnace treatment. An electrically operated Brown hoist, equipped with a lifting magnet, handles the scrap iron and loads the copper.

Details of Operation.

The tailings are subjected to a simple oxidizing roast, no particular care being taken to obtain a large amount of sulphate. The sulphur content of the feed is about 2.2% and that of the calcine about 0.6%. One-third of the total sulphur in the calcine is in the form of sulphate. When too hot a roast is attempted in order

to decrease the total sulphur content, a certain portion of the copper is rendered insoluble in all ordinary acids, with the exception of hydrofluoric.

A pyrometer is inserted over the fourth floor of every furnace, and by means of these, the firemen are able to keep constant control of the temperature. The best results are obtained by keeping the fourth floor at about 500° C. The hottest hearth in the furnace is the third or fired floor, and averages about 535° C.

The water for the calcine cooler systems enters at about 40° C., is discharged at 65° C., and is piped to the solution building, where it is used to heat the circulating solutions. It is then pumped back and used again in the coolers. The calcine after passing through the coolers, and after the addition of 1% moisture, while going through the mixers, has a temperature of about 45° C. During the conveying from the roasters to the leaching tanks, this temperature is lowered to 40° C.

Leaching.

The leaching is done by continuous downward percolation, no circulation or upward percolation being used. The percolation rate will vary from 3 ins. per hour with the first solution to as high as 10 ins. with the wash water. As nearly as possible all solutions and wash waters go on the charge at 40° to 50° C.

It requires about one-fourth of the weight of calcine, in weight of solution, to saturate a charge thoroughly.

There are five solution tanks: One for storage of No. 1 solution, one for No. 2 solution, one for copper solution, and two for wash-water.

	Cu Pet.	H ₂ SO ₄ Pet.	NaCl Pet.
No. 1 solution tank	0.8	5.0	7.0
No. 2 solution tank	0.1	0.5	3.5
Copper-solution tank	1.9	1.0	7.0
Wash-water tanks	0.2	1.0	1.0

After a tank is charged with calcine and leveled, 250 tons of No. 1 solution is added as fast as the charge will absorb it. The drain valve is always open, so, as soon as the solution reaches the bottom of the tank, it commences to drain to the copper-solution storage tank as copper solution. From the copper-solution tank there is only one outlet, which is to the precipitation launders. After traveling through the launders, two-thirds of the solution is returned to the No. 2 solution tank and the balance wasted. This waste is necessary to keep impurities such as iron and aluminum sulphates from building up in the system.

When the No. 1 solution has all been added to the leaching tank, the solution is allowed to drain until none shows on top of the calcine, when 1% of the weight of the charge, of common salt (NaCl), is added 100 tons of solution from No. 2 solution tank but with additional strong acid to bring it to 20% H₂SO₄. Following the 20% acid solution, 150 tons of No. 2 solution is added, but without additional strong H₂SO₄. This scheme gives a zone 4 or 5 ft. in depth of very strong chloridizing solution, traveling down through the charge. There is about 8% of ferrous

and ferric iron in solution, which, with the salt, forms ferric chloride, in itself a very corrosive reagent, even dissolving a considerable amount of unroasted sulphide. This chloridizing action also gives the silver extraction, as without it very little silver is recovered. The 150 tons of No. 2 solution which follows the 20% acid is for the purpose of washing out silver chloride and dissolved copper which may have been held in the calcine. It carries very little copper or acid, but is fairly high in salt content, and therefore better than a clean water wash. Following the last acid solution, about 300 tons of hot, clean water is added.

The two portions of No. 2 solution, one at 20%

FIG. 4. VERTICAL SECTION THROUGH FURNACE.

acid, and the other at 0.5% acid, after percolating through the charge, drain to the No. 1 solution tank.

The wash water, less a quantity sufficient to make up for the discarded solution, drains to the two wash-water tanks. The balance goes to the No. 2 solution tank and adds enough to make up the amount of solution discarded from the precipitating division each day.

Precipitating.

The practice here is too old to necessitate much explanation. The main advantages in the practice at this plant over the usual practice are the large launders, which make it possible to put in large and odd-shaped pieces of iron, and the presence of salt in the solutions which prevents the copper from plating on the

iron, and makes a soft spongy cement copper which is easily washed off with a hose, leaving the iron clean for more precipitation. It is never necessary to remove the iron for cleaning. The silver is recovered by precipitation on the precipitated copper.

Results.

The resulting cement copper carries about 70% copper. The following data are taken from the reports for the month of October, 1915. This is a representative month, but it is certain that the results will be improved upon, after longer operation.

Sard tailings treated, tons.....	70,401.00
Copper in feed, per cent.....	0.575
Silver in feed, ounces per ton.....	0.45
Copper in tailings, per cent.....	0.082
Silver in tailings ounces per ton.....	0.14
Sulphuric acid (60° Bé), pounds per ton of feed.....	64.90
Coal, per cent of feed.....	3.30
Salt, per cent of feed.....	1.52
Iron, pounds per pound of copper.....	2.00

The plant during this month made an extraction of about 80% of the copper and 60% of the silver. This is less than indicated by assays of heads and tailings owing to various plant losses of which the largest is dust from the roasting furnaces amounting to about 4.5% of the copper in the feed.

Analyses of Feed and Tailings.

	Cu, Pct.	Ag, Ozs.	SiO ₂ , Pct.	FeO, Pct.	S, Pct.	Al ₂ O ₃ , Pct.	CaO, Pct.
Feed	0.575	0.45	81.3	3.0	2.1	9.4	0.4
Tailings	0.082	0.14	84.7	2.1	0.4	8.7	0.4

A New Use for Motor Truck.

A very interesting and unusual use of the motor truck is illustrated by the accompanying photograph.

This 4-wheel drive truck is used in place of a loco-

600 linear feet of roadway are being laid daily. The track is 4 miles in length and 10 round trips are made each day. Each trailer carries 1½ yds. of gravel or crushed rock, making a total pay-load of 24 to 26 tons. The truck pulls this load while running in high gear, and travels at 12 to 15 miles per hour.

Fifty teams and wagons were unable to do the work which is now being done by this truck and string of trailers, according to the contractors, and an enormous saving in cost is effected. The average daily cost of operating the truck and trailers in this service is \$17.

The motor truck is built by the Four Wheel Drive Auto Co., Clintonville, Wis.

Another Manganese Ore Company.

The Manganese Products Co., 35 Wall street, New York, incorporated in Delaware April 1, 1916, has taken over the Kennedy manganese ore mines, located about 5 miles from Lipscomb, Augusta county, Virginia, formerly owned and operated by the Steel Ores Co. of Virginia. About 15 years ago a mill was erected to wash and crush the ores and since then about 20,000 tons, averaging 45% manganese, was taken out in intermittent operations. The new company is now operating the mine and mill. It controls about 10 miles of property along the Blue Ridge mountains, comprising about 5500 acres. With improvements in the mill about 50 tons of ore a day will be produced, beginning in May. A standard gauge railroad, 6 miles long, connecting with the Norfolk & Western, is owned by the company. One object of the new organization is stated to be to assist the small ore producers of that region to increase their output

A 4-WHEEL DRIVE TRUCK HAULING GRAVEL ON A NARROW GAUGE TRACK.

motive to draw a string of heavily loaded trailers on a narrow gauge track. The truck itself straddles the rails, and it is interesting to note that enough traction is secured to pull the train easily up a 5% grade, although no load whatever is carried on the body of the truck.

The crushed rock, gravel and cement hauled by this outfit are being used in the construction of a 16-ft. concrete highway in Iowa. The large amount of material hauled is indicated by the fact that from 500 to

and dispose of their ore as a nucleus for an independent furnace operation.

The Geological Survey now has available for distribution its annual statement on potash salts for 1915, which also includes some simple tests to determine the presence of potash. The amount of potash salts imported for consumption into the United States during the year is given at 170,555,450 lbs., valued at \$3,765,224.

An Improved Separating Magnet.

The Kidney improvement gives very important technical value to the universally used horseshoe magnet. The rapid, clean, automatic discharge of attracted particles, without labor or loss, affords practical means of estimation of percentages, the separ-

FIG. 1. CIRCUIT CLOSED WITH PARTICLES ADHERING. FIG. 2. CIRCUIT BROKEN PARTICLES DISCHARGED.

ated fractions being available to test for associated values.

These separating magnets are fitted with improved cases in which the poles are always in forced contact with a fixed current keeper for preservation of magnetic integrity. These improvements should be of much interest, and more especially to those interested in mining.

Stoping Costs in the Calumet & Arizona Mines, Bisbee, Ariz.

In summing up the various methods of stoping ore in the Calumet & Arizona Mining Co.'s property, Philip D. Wilson is of the opinion that the cut-and-fill system is easily the cheapest and most satisfactory in every way where conditions will permit of its use. The item of timber, usually a large one (\$17.50 per thousand), is much reduced and the risk of fire is virtually eliminated. While any large horse of waste encountered in the ore may be kept separate and left in the gob, any attempt at close sorting is inadvisable. In the case of the Mitchell slicing system, if the ore is fairly clean the greatest ultimate economy will be gained by mining it all as it comes without attempting to sort. The consequent low-stoping cost obtained by mining large tonnages rapidly will more than counter-balance the increased cost of handling and treating a slightly lower grade material. In neither system can the grade of ore be controlled as closely as in the square-set or top-slice caving methods. Where the ore is very irregular or badly mixed with waste the square-set method is still found to be the most satis-

factory. If the stope is in good condition a considerable proportion of the timbers may be safely extracted as it is filed.

For a heavy uniform ore body the Mitchell inclined top-slice caving system is a good one. While it still retains some of the disadvantages of the old-fashioned top slice it is in many ways a great improvement over the older method. Its principal advantages are the substantial saving in labor and powder, and the greater rapidity with which the ore may be mined. Its unfavorable features are those of all top-slice caving methods, the almost inevitable sacrifice of some ore, narrow work, poor ventilation in the stopes and the fact that the ground above is so badly broken as to render the expense of future work on upper levels so great as to be in many cases prohibitive. The Mitchell slicing system finds its chief application to fairly regular bodies in not too heavy ground. Under favorable conditions lower costs are obtained with this method than by any of the others in use, with the exception of the cut-and-fill method. Its saving in labor and timber is a very appreciable one over square-set stoping and the cycle of preparing, mining, filling and abandoning a section is normally a very short one. This feature, in addition to permitting a large daily output, reduces considerably the repair cost incidental to keeping a section of the country open over a long period. In short, the introduction of these methods has effected a tremendous saving to the Calumet & Arizona Mining Co. during the past few years without the slightest sacrifice of the safety of the men or of the mines in which they have been used.

¹Figured on the basis of the wet tons mined. These costs obtain under normal conditions with a base wage of \$4 per day for miners and \$3.75 for muckers.

²Oxide ore in place will average from 12 to 16 cu. ft. to the ton.

³Sulphide ore will average from 9 to 11 cu. ft. to the ton. *Associated Geologist. Abstract from Proc. A. I. M. E.

The American demand for Japanese zinc dust has expanded greatly since the war. About 600 tons is sent yearly to New York and San Francisco importers from the Nagasaki district.

Operations at Battle Mountain, Nevada

By W. A. SCOTT.

Battle Mountain Mines & Development Co. recently put in operation its new mill for concentrating silver sulphide ores by fine crushing and oil flotation. The property is in Lewis canyon, 16 miles south of Battle Mountain, Nev. It is owned by M. H. Whittier of Los Angeles and associates. The group is made up of a number of properties, operated separately, between 1870 and 1885, which were acquired and consolidated 5 years ago by this company. In early days two stamp mills were built at the mouth of the canyon to treat these ores by roasting and

appearing on the mountain side, and running nearly parallel to the canyon, is strong and conspicuous. All conditions are favorable to opening the vein by crosscuts from the main canyon, or by adit levels from secondary canyons. While the vein, as shown by the principal workings, is in limestone, the deepest workings show a porphyry foot wall and give some evidence of a contact at greater depth between lime and porphyry. The vein width varies, being from 8 ins. to 70 ft. The gangue material comprises white quartz, lime and decomposed matter, disseminated

BATTLE MOUNTAIN CO.'S MILL.

ORE-LOADING BIN AT CROSSCUT.

MILL BUILDINGS IN LEWIS CANYON.

GASOLINE LOCOMOTIVE FOR ORE HAULING.

pan amalgamation, but no attempt was made to handle ore containing less than 60 ozs. silver. This was known as Camp Lewis. Some of the old crosscuts and levels, by which parts of the property were opened 30 years ago, are of some utility in present-day operations.

Lewis canyon, the head of which is on the slope of Buck's peak, takes a northerly course, discharging into Humboldt valley. The most important part of this company's property lies within and on the west side of this canyon. The principal vein strikes north-south through a limestone formation, and has an average dip of 20° to the west. The vein cropping,

through all of which is sulphide of silver and ruby silver, accompanied by a low percentage of the sulphides of iron, antimony and copper. The most paying bodies of ore, however, occur in shoots and chimneys. The grade of ore runs from 5 ozs. up to several hundred; but it is stated that the mine run of mill ore is 15 to 20 ozs. in silver.

All operations during the last 5 years, or since this company got possession of the property, have been under direction of M. R. Thurston, general manager. Within that time the vein has been tapped by several crosscuts and adits, and drifts have been run in ore. The lowest crosscut, or Monitor level, starts

GASOLINE LOCOMOTIVE HAULING ORE TO MILL.

TREES IN BLOSSOM AMID SNOW DRIFTS.

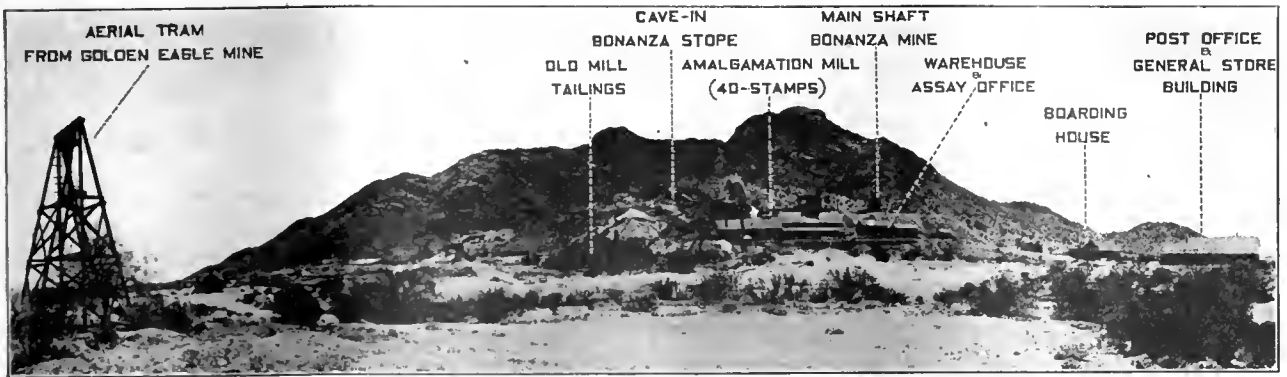

800 ft. from the mill, runs 800 ft. to the vein, and continues 1200 ft. as a drift on the vein. The next crosscut level is known as the Eagle. It is 2500 ft. farther south, and 269 ft. higher (vertically) than the Monitor. It was driven 200 ft. as a crosscut, and then 500 ft. farther on the vein. The Henry Logan crosscut, 3300 ft. south of the Eagle, and 800 ft. higher, was driven 936 ft. to the vein, on which drifts were run in ore 500 ft. north and 500 ft. south. Next is the Star-Grove crosscut, which goes in 500 ft. to the vein, on which there is 1000 ft. of drifting. The workings of Henry Logan and Starr-Grove are connected by a 185-ft. winze. Another crosscut, 600 ft. south of Starr-Grove and 165 ft. higher, was driven to the vein and advanced 300 ft. as a drift. These five working levels are connected with the mill and with each other by $2\frac{1}{2}$ miles of 20-in. gauge car tracks, built on a $7\frac{1}{2}\%$ grade, on which $1\frac{3}{4}$ -ton ore cars are hauled by a gasoline locomotive, designed by Manager Thurston and built in company's shop.

Ore is being taken from all these levels except the Monitor. It is estimated that there is 600 ft. of stopping ground between the Monitor and Eagle levels; 1500 ft. between Henry Logan, 280 ft. between Henry Logan and Starr-Grove, and 486 ft. between Starr-Grove and the highest level. Through these levels the vein is opened a distance of $1\frac{1}{2}$ miles on its strike, but not connectedly. The highest workings are connected to the main track by a 300-ft. surface tramway, built on a 37° incline. All levels are supplied with compressed air for drill power, the air lines having been laid from the power plant in the mill.

The mill building contains a 200-hp. 4-cylinder Diesel engine, furnished by the Dow Pump & Diesel Engine Co., Alameda, Cal. Power is transmitted from the engine to a line shaft, which extends the full width of the mill, by a $1\frac{1}{4}$ -in. rope drive. By this connection the air compressor and all mill machinery are operated by belt drives. This engine operates on $4\frac{1}{2}$ gals. 16-gravity crude oil per hour, which costs \$1.80 per bbl. at the plant. The mill equipment consists of a No. 4 Traylor jaw crusher, a 6-ft., type 63 Marcy mill, Dorr duplex classifier, an under-floor launder and Callow flotation machines, consisting of

3 rougher and 1 cleaner cells. It is noted that no tube mills are used, the ore being reduced to sufficient fineness by the Marcy mill in which 2, 3, 4 and 5-in. steel balls are used. Only about 2% of the Marcy product that passes from classifiers to flotation cells remains on a 100-mesh screen. The oil mixture, consisting of 45% coal tar, 45% coal tar creosote and 10% pine oil, is fed to the Marcy mill, the oil feed running $1\frac{1}{2}$ lbs. per ton of ore. The mineral froth from rougher cells is carried by bucket elevator to the cleaner cell, and from this the concentrates are passed to a 3-compartment settling tank, and afterwards dried in an 8 by 13-ft. sheet-iron pan, the heat being supplied by exhaust gas from the engine, and also by a crude oil burner. The tailings from cleaner cell are returned by a 2-in. Krogh pump to the Dorr classifier for re-oiling and mixing with the pulp going through the mill. The tailings from rougher cells pass to the tailings pond. No filter press is used in eliminating moisture. It is claimed that as these ores contain no carbonates nor oxides, a recovery of 95% can be made. The sulphides in this mine are very favorable to recovery of the metals by flotation. The plant is designed to handle 100 tons of ore per day. The flotation equipment was put in under direction of W. P. Cary, of the General Engineering Co., Salt Lake.

Cerium-Iron Alloys.—Alloys of cerium with iron, containing 55 to 85% cerium, are pyrophoric, which property is increased by quenching. A writer in the *Zeitschrift für Metallographie* states that a microscopical examination of cerium-copper alloys shows that the two metals in the molten state are completely soluble in each other, but that in the solid state there is no solid solution, the four intermetallic compounds being Cu_6Ce_7 , Cu_4Ce , Cu_2Ce and CuCe . Three typical eutectics, with 17, 44 and 45% of cerium, respectively, occur. Above 5% cerium, the hardness of the alloys increases, the greatest hardness being in the compounds Cu_6Ce_7 and Cu_2Ce , though the hardness of the eutectics is low. Metallic cerium is now being made electrolytically in the United States and is held at \$8 to \$9 per pound.

GENERAL VIEW OF THE HARQUA HALA MINE OF THE YUMA-WARRIER MINING CO.

Reopening Old Mines in Arizona

By WILLIAM P. DE WOLF.

A noteworthy feature in connection with the increasing mining activity in Arizona, is the number of old-time bonanzas that are being re-opened under mining conditions which indicate they are soon again to occupy a position in mining affairs akin to that held by them in former years. The majority of these properties had, until recently, been dormant for a considerable period of years. There is ample warrant for the assertion that the development now underway, and planned for the future, will produce satisfactory results.

Among the properties of former days that have come back forcefully enough to demonstrate they have a future as well as a past is the Harqua Hala Bonanza. The mine is being worked by the Yuma-Warrior Mining Co., a close corporation whose shareholders are representative mining and business men of Chicago and Prescott. The property is situated in the foothills of the Harqua Hala range in Yuma county, short distance from the Yavapai county line, and within 8 miles of the railroad.

Early History of Mine.

The history of the Harqua Hala Bonanza mine dates back to the "days before the railroad" in Arizona—the days of hostile Indians and renegade whites, when a man's rifle was his best friend; the days of slow journeys over arid wastes beneath the pitiless rays of the desert sun. The railroad and the automobile have, however, robbed the desert of its terrors; and renegade Indian and white long since went the way of all flesh that set itself in opposition to the stern justice of the frontier.

Gold was first discovered in the vicinity of the Harqua Hala Bonanza mine in 1762, by a party of Spanish prospectors. Hostile Indians quickly put an end to their activities, however, and no further attempt was made to prospect in the Harqua Hala country until 1814. That effort, like the first, proved disastrous to all concerned. The first lode locations under American dominance were made there in Novem-

ber, 1888. These claims, known as the Harqua Hala Bonanza and Golden Eagle groups, are now being operated by the Yuma-Warrior Mining Co. From then until now the first mentioned has produced about \$5,000,000 in gold.

Find High Grade Ore.

Exceptionally rich ore was discovered in near-surface workings on each of the claims by the original locators and others; and when the news became known, there was a rush of prospectors to the locality. In the course of time the locators of the Harqua Hala Bonanza and Golden-Eagle groups sold them to Phoenix parties, who proceeded to open them up. They erected a 20-stamp mill and in 30 days cleaned up \$96,000 in gold.

Subsequently the properties were purchased by an English syndicate, who sunk an incline shaft on the Harqua Hala Bonanza group to a depth of 200 ft, and equipped the property with mine and mill machinery. It is said they extracted \$4,000,000 worth of gold ore above the 200-ft. level. The bullion was teamed to Phoenix—120 miles distant. Road agents infested the trail in those perilous days and as a result of their activities several shipments of bullion from the Harqua Hala Bonanza and Vulture mines failed their destination. After a number of episodes of that nature, in one of which the manager of the Vulture mine was killed and \$60,000 worth of bullion stolen, the Harqua Hala bullion was moulded into bars of such massive size and weight the bandits could not make way with them across the arid stretches. Shipments of ingots having a value of \$365,000 each were for a time sent out from the property.

The "Bonanza Cave."

Owing to the long freight haul, the scarcity of wood in a country of dwarf sage and mesquite bush, and the consequent high price of mine timbers, the latter were sparsely used. As the ground was opened and stoped the custom was to leave supporting pillars

of ore, much of which was high grade. While attempting to remove these pillars, in later years, the ground caved from the third level to surface for several hundred feet in either direction from the shaft, leaving a chasm extending from wall to wall—a width of 70 ft.—and laterally along the vein workings a length of 400 ft. This great cavity is known as the "Bonanza Cave." It cut off access to the mine workings and forced the sinking of a new shaft. The latter is located about 400 ft. west of the old shaft, and intersects it at a depth of 286 ft. on the incline. Connection was made with the 2nd and 3rd levels of the old workings.

In drifting southwest from the new shaft a body of ore was opened and stoped that milled \$2,000,000 in gold. This stope is of enormous proportions, and presents the appearance of a natural cavern. Due to its unusual size and shape the miners called it "Castle Garden." On the same level an attempt was made to get under and draw the ore from the "Bonanza Cave" by means of a crosscut. As it was driven under the "cave" on the hanging-wall side it failed its purpose, owing to the unstable nature of the caved ground, which could not be safely timbered. Ultimately this crosscut caved to the solid rock below. These reverses were augmented by a barren streak in the vein, and the Englishmen, becoming discouraged, quit.

The New Regime.

About 3 years ago the Harqua Hala Bonanza and Golden Eagle groups were taken over by the present operators. Since then they have undergone development almost continuously. The deal included a 40-stamp mill, air drills, compressors, hoisting machinery, and a full complement of camp equipment and underground mining machinery tools, together with an aerial tram about seven-eighths mile long running from the Golden Eagle shaft to the Harqua Hala Bonanza mill. A pumping plant, and a water supply more than ample for camp and milling needs were also included in the deal.

Last February the company began milling the ore during development and to date has shipped about \$25,000 in bullion. Shipments of the latter in bars valued at \$4000 each, are made from time to time to the Bank of Arizona of Prescott. Work at present is confined to proving up new ore bodies that have been found in the Harqua Hala Bonanza mine. Geological conditions on the lower levels indicate that the Harqua Hala will come back as a copper mine carrying high values in gold.

Strike Pay Grade Ore.

When the present operators took over the property work was immediately resumed at the old 4th level and a crosscut drift driven around the caved portion of the "Bonanza" stope to the foot wall for the purpose of drawing the large tonnage of vari-grade ore. By utilizing supplementary milling appliances—soon to be installed—the greater portion of this tonnage can be reduced at a profit. In driving across the strike of the

old ore bodies to reach the foot wall of the "cave" 37 ft. of ore was encountered. Fifteen feet of it assayed \$17 gold. The remaining 22 ft., while low grade, has commercial value. The ore stoped from this deposit milled \$9.88 gold.

The same ore body has been opened on the 6th level (50 ft. below), by a crosscut 85 ft. long. Two veins—one pitching to the east and the other to the west—were tapped at that point. Subsequent development demonstrated that the ore body on the 4th level was formed by the juncture of these veins just below the floor of the level. The west vein, where undergoing development on the 6th level, gives assay returns of from \$6 to \$22 gold. The ore taken out milled better than \$8 gold. This vein proves to be the downward extension of the old "Bonanza" vein of which the "Castle Garden" and "Bonanza" ore shoots were a part. Connection has been made with the deposit opened on the 4th level by a winze and an upraise in ore.

Strike Copper Sulphides.

An air hoist was set up on the 6th level and a winze sunk 80 ft. in ore to the 7th level. There drifts were run on the vein, north, 40 ft., and south, 80 ft. The pitch of this ore body is to the south. It was in the south drift on this level that copper sulphides first made their appearance in the mine. Check assays demonstrate the ore carries about 5% copper and \$35 gold. As the copper-sulphide section lies against the foot wall of the vein, directly beneath the oxidized ore opened above, and pitches rather flat to the southwest, the winze was sunk an additional 80 ft. and the 8th level established.

On the 8th level drifts were run north and south in the oxidized ore. One hundred feet from the station copper sulphides were again encountered in the south drift. The crosscut at that point shows 16 ft. of ore, with the copper-sulphide section along the foot wall carrying ore of the same grade as that opened above. The oxidized ore on the 8th level samples \$13.90 gold and for a length of 50 ft. carries gold values as high as \$38. Later the drift on the 7th level was continued in the oxidized portion of the vein, and 90 ft. from the station entered the same ore body that is opened on the 8th level. The crosscut there shows 10 ft. of ore that gave \$12 gold at the mill heads. At that point a winze was sunk in ore about 40 ft., an upraise was made from the 8th level to connect therewith, and an intermediate level established. The ore in the latter has a width of 12 ft. That this ore body will prove of considerable size is apparent, as it has been opened a length of 45 ft. and a width of 10 ft. on the 7th level, a width of 12 ft. at the intermediate level, and a width of 16 ft. on the 8th level.

Ore Widens Out.

The drift on the 7th level has been extended beyond the winze a length of 210 ft., giving it a total length of 300 ft. For the last 25 ft. the ore has gradually widened until it extends beyond the sides of the drift. A crosscut will be run to determine its breadth.

Recent assays gave returns of \$21.40 gold-silver. This is the latest development of importance, inasmuch as the drift is now being driven under the old "Castle Garden" stope from which the valuable ore tonnage before mentioned was mined.

The work thus far done having demonstrated the presence of extensive ore bodies in the new workings along the strike of the "Bonanza" vein, the company is planning for more aggressive mining and milling operations. These plans include the sinking of a 3-compartment vertical shaft, and the addition of concentration and flotation units to the 40-stamp mill to reclaim the gold, silver and copper contents of the sulphide ore, as the present amalgamation plant is capable of treating only the oxidized ore exposed in the upper levels.

Portable Electric-Driven Air Compressors for Mines.

In order to present a means of securing the fullest benefits of compressed air machinery in electrically-equipped mines, while utilizing all of the advantages of the electric system of distribution, the Chicago Pneumatic Tool Co. has developed a portable, self-contained, electric-driven air compressor, known as the Class N-SE mine car.

With regards to economy the unit compares favorably with the central compressor plant on the surface. Its initial efficiency is of course not as high, due to its smaller capacity, but this difference is, in an appreciable degree, equalized by the losses resulting from leakage and drop of pressure in the line with the large plant, and the fact that the portable compressor may be located very close to the work so that the temperature of the air delivered to the drills, etc., is considerably increased. Feeder pipes are eliminated, thus effecting, if these lines are of any length, a saving in capital investment.

The portable unit may be moved from place to place without loss of time, or the necessity for extending or modifying existing pipe lines. For mines whose air requirements are not large it offers a very desirable installation. For others, the air requirements of which vary considerably from day to day, or week to week, it presents an opportunity to reduce the increased cost per unit volume of air resulting from operating a large plant at partial load. This last saving is very important in new development work, where it may take a year or two to reach an air consumption as large as the capacity of the central plant.

The compactness of the compressor is evident from the illustration. The unit consists of a horizontal, straight-line, single-cylinder air compressor, driven by means of a motor through the medium of herring-bone gears. An air receiver of proper size, and a rheostat are provided. The entire apparatus is mounted upon a strong, but light, steel car frame.

Air cylinder is equipped with the "Simplex" inlet and discharge valves, which require no actuating mechanism, no lubrication, and which operate efficiently at high speeds. It is hopper cooled and needs no attention beyond filling the open water box once

a day. An automatic regulator unloads the compressor when the air delivered exceeds the demand.

Necessary fly-wheel effect is secured through the rotation of the heavy gear. Both gear and crankshaft are properly counter-balanced. The positive splash system of lubrication which assures a constant and copious supply of oil to all wearing parts is employed. The gears turn in a bath of oil.

Rheostat is either of the hand-starting or auto-

TOP VIEW, PORTABLE ELECTRIC-DRIVEN COMPRESSOR.

matic type, depending upon conditions. On account of the wide range of voltage found in many mines the latter control is particularly desirable. Since it has a tendency to keep the motor running under low-voltage conditions, and should the current be interrupted the motor will start gradually without attention when it is resumed. With this type of starter a regulating device is connected to the unloader, so that when the load is thrown off the compressor, the motor is brought to a stop and continues inactive until air is again demanded.

Every part of this compressor unit is completely enclosed. Exposure to dampness will not injure it. Deli-

SIDE VIEW, PORTABLE ELECTRIC-DRIVEN COMPRESSOR.

cate or complicated features of construction have been avoided, and the machine is well suited to rough, heavy duty. It is so entirely automatic in action that it requires no attendant, the miner soon learning to handle it properly. The comparative lightness of the car permits of its removal from the rails when demanded by the conditions of operation. It is built in six sizes, ranging in capacity from 51 to 314 cu. ft. of free air per minute at pressures of 80 to 100 lbs.

What the Mining Companies are Doing

Ohio Copper Mining Co.

The reorganization plan of the Ohio Copper Mining Co. calls for the formation of a new corporation with \$5,000,000 new securities, of which \$2,750,000 will be stock and \$2,250,000 6% cumulative repayment convertible bonds. The plan also provides for inclusion of the Bingham Central Ry.

Foreclosure will take place Aug. 22. It is understood that holders of more than \$1,000,000 of the \$1,240,000 outstanding Ohio bonds have consented to the plan. In order that the Bingham Central part of the plans may become effective, the reorganizers of Ohio demand that 75% of the former company's bonds be deposited by Aug. 15.

Stockholders of the Ohio and Bingham Central companies may subscribe for the new bonds at par and accrued interest. The convertibles will also be issued in exchange for the Ohio Co. 6% first mortgage 20-year bonds on the basis of \$75 in new bonds for \$100 of old. Provided 75% of the \$975,000 outstanding Bingham Central bonds enter reorganization of Ohio Co. and the railway is turned over to the new company free from all liens and debts, there will be issued: \$453,375 par value of the new company bonds and \$453,375 of its stock. Or in lieu thereof, the Bingham committee may turn over to the Ohio committee all bonds deposited with it for which there shall be issued by the new company for each bond of the Bingham Central 46½% in bonds and 46½% in stock of the new corporation.

The reorganizers plan a 5 years' voting trust for the outstanding capital stock.

First National Copper Co., Calif.

The initial dividend of the First National Copper Co. is to be paid shortly and will amount to 25 cts. a share on its outstanding capital.

Vice-President Wm. A. Kerr says: "Through the 10-year contract which Balaklala (the operating company) has with the United States Smelting Co. dividends are at last possible. The first payment will be 25 cts. and others will follow as earned. We are now shipping 9000 tons of ore monthly to the Mammoth smelter. Our ore averages about 2.83% copper and carries \$1 in previous metals."

On Aug. 24, 1915, the Balaklala mine resumed shipments after a long idleness. Unable to use its own smelter on account of fume troubles, Vice-President Kerr arranged an advantageous contract with the United States Smelting Co. for 10 years. From the commencement of shipments to the end of the fiscal year, on June 30 last, the company made net profits of \$175,000 from 76,000 tons of ore. The company spent about \$25,000 in making necessary repairs incidental to resumption of operations and conducted development work equal to 33½ cts. per ton of ore mined.

The management now plans to increase development work, for which it will set aside 50 cts. per ton of ore mined. This new work will be confined chiefly to diamond drill operations.

International Nickel.

It is understood that the directors of the International Nickel Co. have decided on a policy of distributing dividends more evenly over the four quarters instead of waiting until close of the year to make a special distribution. That undoubtedly means a higher quarterly rate than 5%, or \$1.25, that prevailed during the last 12 months.

International Nickel's business is running heavier this year than ever before. Each month is showing larger earnings than preceding month. Demand for the metal is increasing so rapidly that the company finds itself unable to build up a reserve supply. Practically each pound of nickel is marked for a customer as soon as it comes out of the ground.

In shipping nickel abroad International Nickel Co., by

agreement with the British government, consigns the metal to Merton & Co. in London so that every safeguard is thrown around exports so far as the British government is concerned.

International Nickel is licensed by the Canadian government to export the nickel matte from its mines at Sudbury to its refinery at Bayonné. No nickel can be sent out of Canada except by license, but that restriction was not aimed at International Nickel, but at some small producers in Canada who were exporting without informing the government of destination. As soon as licensing policy was decided upon several months ago, a license was issued to International Nickel Co., which had all along conformed strictly to the requirements of the government in that respect. Thus Canada maintained her grip on all shipments of the metal without interfering with International Nickel, which is the world's greatest producer of nickel, turning out about 80% of the total.

Republic Iron & Steel.

The general balance sheet of the Republic Iron & Steel Co. as of June 30 compares with 1915 as follows:

Assets—	1916.	1915.
Cost of properties	\$72,141,634	\$69,484,869
Investments	928,051	943,234
Cash in trustees' hands	26,928	
Inventories	7,212,409	7,219,488
Ore contract payments	406,427	758,431
Accounts and bills payable	5,688,025	3,830,374
Cash	6,355,588	2,698,466
Deferred charges to operation	828,785	396,700
Total	\$93,587,848	\$85,931,562
Liabilities—		
Common stock	27,191,000	27,191,000
Preferred stock	25,000,000	25,000,000
5% sinking fund bonds	16,833,000	15,105,000
Potter Ore bonds	264,000	277,000
Martin & Palos Coke bonds and notes	227,500	265,000
Collateral notes		2,000,000
Dividend warrants		186,658
Accounts payable	2,584,125	1,434,546
Ore contract balance	142,553	170,094
Taxes accrued	221,362	229,610
Interest accrued	213,750	193,975
Dividends payable	937,500	
Unclaimed dividends	2,746	2,746
Reserves	7,472,282	6,253,139
Surplus	12,498,030	7,622,793
Total	\$93,587,848	\$85,931,562

Consolidated Interstate-Callahan.

The Consolidated Interstate-Callahan will be able to earn in excess of \$1,000,000, net annually, with metals at the average prices prevailing during the 10 years preceding the outbreak of the European war. This is indicated by the company's report to the New York Stock Exchange. These prices, according to the report, were 4.648 cts. for lead, 5.6775 cts. for zinc and 57.844 cts. for silver. The estimate is based on the production for May, which was nearly identical with that for several months preceding, the output for the period having been 6000 tons of 49½% ore and concentrates and 500 tons of ore that carried 50% lead and 20 ozs. silver.

Under the terms of the long contract for the treatment of the output, which becomes effective September, at the prices cited, the zinc product will be worth \$34.29 per ton, approximately \$205,740 monthly, less \$63,150 for freight and treatment charges, leaving \$142,590 net. The lead product will be worth \$27.47 per ton, less freight and treatment, or \$13,735 a month, making the total income \$156,325. From this must be deducted \$61,578 a month, or \$9 per ton, for operating costs, and \$4000 for overhead expenses, leaving a monthly net profit of \$90,747, or \$1,088,964 for the year. To this must be added \$15 a ton monthly, derived from the saving of the flotation plant, estimated at 400 tons every 30 days, or \$62,000 annually, making the total yearly net income \$1,150,964, or enough to pay dividends of approximately \$2.47½ per share

on the issued capitalization of 464,990 shares at \$10 each or about 20% on the \$4,649,900 outstanding.

The annual meeting of the stockholders will be held in Phoenix, Arizona, Aug. 21, and important changes in the articles of incorporation will be considered. One of them provides for increasing the number of directors from 12 to 15 and the retirement from office of one-third of the number every third year. Another change to be considered places the end of the fiscal period at Dec. 31, instead of June 30. It is to be proposed to create an executive committee of 5 members, including the president, who shall be ex-officio chairman.

Tonopah Mining.

A statement following the dividend checks of the Tonopah Mining Co., on July 21 shows the combined income and surplus account of the company and the Desert Power & Mill Co., for the quarter ended May 31, 1916. The net earnings of the two companies for the 3 months amounted to \$121,689.39, which, with miscellaneous income of \$39,743.51, brought the net receipts up to \$161,432.93. From this sum, there was deducted \$16,965.51 for exploration expense and \$26,454.78, the latter sum being on account of the Moore filter suit. The net income for the quarter, therefore, amounted to \$118,012.64. The statement for the quarter ended May 31, 1916, is as follows:

Combined Income and Surplus Acct.—	
Gross value or milled.....	\$383,834.22
Metal losses in milling and refining.....	40,459.27
Gross value of mill products.....	343,374.95
Mining, milling, marketing and gen. expenses.....	221,685.56
Net earnings for quarter.....	121,689.39
Miscellaneous income.....	39,743.54
Profits from operation, etc.....	161,432.93
Exploration.....	\$16,965.51
Filter suit.....	26,454.78
Total.....	43,420.29
Net income for quarter.....	118,012.64
Quick Assets—	
Cash on hand May 31.....	75,270.27
Bonds purchased.....	1,019,831.25
Certificate of deposit.....	25,000.00
Silver bullion stored at 50 cts. per oz.....	431,010.95
Total May 31.....	1,551,112.47
Dividend payment July 21.....	150,000.00
Total quick assets July 21.....	1,401,112.47

Tonopah Placers Co., 83¼% of which is owned by Tonopah Mining Co., had net earnings for the quarter of \$39,454.46.

Besides the profits from the placer operations, it is confidently expected that the Eden Mining Co.'s plant, which will be put in commission some time this fall, will contribute largely to the earnings of Tonopah Mining. Construction work on the mill is proceeding, and the machinery is now being installed with promptness.

The report of mill operations of the Tonopah Mining for the week ending July 27th, shows that an average of 65 stamps were kept dropping and that 2167 tons of ore were put through the mill. The ore averaged \$12 per ton.

Dome Lake.

The Dome Lake Mining & Milling Co., Ltd., has decided to issue 459,088 shares of new stock at 20 cts. per share. It is now being offered pro rata to such stockholders as may on or before Aug. 15 request their share of such allotment. Under the above provision each shareholder is entitled to subscribe for 3 shares for every 10 shares held by him. No allotments of fractional shares will be made and any shares not taken by shareholders will be disposed of by the directors as they may deem advisable. The present stock issue will clear the company of all debt and provide working capital. The proceeds will be used exclusively for capital expenditure, that is, further development, addition to plant, etc. The following estimate of reserve tonnage has been submitted to the directors of the company by Mr. Thomas: No. 1 vein west, about 300-ft. level, 35,000 tons; value \$620,000. No. 1 vein west, about 100-ft. level, 11,600 tons; value \$233,500. No. 1 vein east, about 100-ft. level, 35,000 tons; value \$630,000. No. 3 vein, broken and above 400-ft. level, 10,000 tons; value \$200,000. Ore broken and on stock pile, 7,000 tons; value \$63,000. Total tons, 83,600; value, \$1,246,500.

Miscellaneous Company Notes.

Keweenaw Copper has levied an assessment of \$1 per share, payable either at office of company in Calumet, Mich., or at Old Colony Trust Co., Boston, Sept. 2, by stock of record Aug. 12.

Calumet & Hecla should soon have paid off all the notes issued at the time the company made its \$20,000,000 investment in the shares of the Bigelow companies. At that time the company made its first note issue, \$8,500,000. These notes have been called in until now there is outstanding only \$1,700,000. Of this the company has recently acquired \$1,300,000, leaving but \$400,000 to be secured.

E. N. Breitung Co., Ltd., has concluded arrangements for taking over the Black Friday group. The first payments were met in Butte July 15. The initial funds will be used to retire outstanding obligations of the Black Friday Gold Mining Co., a Montana corporation, with capital of \$2,000,000, divided into 400,000 shares of a par value of \$5. Its officers are Willard Bennett of Butte, president; Albert Galen, formerly attorney general of Montana, vice president; R. M. O'Hearn, secretary, and A. B. Bennett, treasurer.

Directors of the Utah Metal & Tunnel Co. held to the original idea in declaring a dividend at their recent meeting. Last week there appeared some doubt that dividends would be inaugurated now, but the company's financial situation made it appear conservative. The company today has cash—in banks and represented by metals sold—amounting to \$1,024,396. As there are 685,266 shares outstanding, the 50-ct. dividend will reduce this by \$342,633, or say to slightly less than \$700,000, which is amply sufficient for all present and prospective needs. Earnings are naturally showing some falling off from the high levels of a few months ago, but an increase in production in the near future will in large part offset the decline in metal prices.

It is said that at the September meeting, Ray Con. will raise the dividend from 50 cts. to 75 cts. per share. Present and prospective earnings would seem to justify the increase. Ray Con. earned, in the 6 months ended June 30, \$5,272,000, or \$3.25 per share, on 1,600,000 shares. As the company paid \$1 in dividends in the period, it added to surplus \$2 for every \$1 dividend. There is reason to believe that the last half of the year will make an even better showing of earnings. The plant was nearly shut down at two different times in the first quarter, due to floods. The result was that production was below normal and costs above. Net for that quarter was \$2,200,000. The second quarter showed a comeback in production and earnings; profits were about \$3,000,000.

No shipments of ore have been made by the Trinity Copper Co. despite the high copper metal prices, and none appear to be in prospect. President Lawson in 1914 through the medium of a typewritten report presented at the annual meeting stated that "Trinity is still waiting," and called attention to the unsatisfactory condition of the metal market. The general manager's report likewise referred to the market conditions by saying that "economical extraction of the ore is ready when the market shows improvement." All this was supplemented by Director Albers' remark to the effect that "it is better to let the copper remain in the ground than to try and produce it with the metal under 14 cts. a pound." Copper metal crossed 14 cts. a pound in January, 1915, and has since sold as high as 31½ cts.

The Republic Mines Corporation, organized to operate the Lone-Pine Surprise, got into serious financial difficulties 3 years ago. It will pay off all obligations within the next few weeks. The funds to retire the obligation have been received from Republic Con. Mines Co., which has the property under bond. The last payment of \$82,000 was supplied by the Northport Smelting & Refining Co., which has the privilege of taking over the entire property upon terms not yet made public. It is believed that a dividend of approximately 5 cts. per share will be available for stockholders of the bankrupt concern after outstanding debts have been retired. The amount will probably be distributed in two equal amounts, one within 3 weeks and the second within 3 months.

Reviewing the Metal Markets.

The swing of metals, which has been downwards, is now beginning to turn the other way. Business and prices are beginning to increase. Confidence of producers in the future is now being borne out. Consumers who looked for further reaction are hastening to cover. The three principal metals have received the first impulse. Copper, lead and spelter are once more receiving attention. Beginning with a buying-movement in copper, the other metals have felt the first signs of increased buying. Europe, once more, furnishes the starting power. Orders for copper for delivery this year and negotiations for a tremendous block for next year removed the last vestige of doubt as to the future of the metal. Retrospection indicates that the Entente Allies, while maintaining a good poker face, failed to cause American metal interests to solicit business. Instead producers on this side sat tight, and the business is beginning to come to them as they expected.

Last May and June Lloyd George issued many announcements to the effect that England would soon be independent of the United States with respect to shells. As to raw materials his regulation of the metal markets was aimed to depress the prices. Ever since May metal producers have been waiting. They risked a great deal, but are now enjoying the fruits of their sagacity. Instead of taking Lloyd George's remarks at their full worth, they used their own deductions to show that England must continue to depend on this country as long as hostilities continue. Late in July orders for shell steel began coming across, and then followed orders for completed shells. Since July 29 steel mills have taken orders for over 600,000 tons shell steel on which deliveries are to be made by the end of the first half of 1917. These orders were fore-runners of an improvement in non-ferrous metals.

Last week authentic information was obtained of negotiations for a large block of copper. Estimates place the total at 300,000,000 to 500,000,000 lbs. Combined with this development came orders for copper for delivery in the fourth quarter. Russia, Italy and France bought round lots. Prices began to look up. Domestic consumers who were allowing their future needs to go uncovered were once more caught. They quickly entered the market. As a result copper producers are busily engaged in taking orders. Indications are that the buying movement now gaining momentum will eclipse the April movement. Liquidation of excess holdings of consumers has ceased. The copper situation once more is commanding attention. Electrolytic for the fourth quarter is being sold at 26½ to 26¾ with spot up to 27½. Business for the first quarter has been done at 26. The history of the last movement will repeat itself. When foreign and domestic demands are satiated 2 or 3 months hence, copper producers will have booked orders that

will take the bulk of their output over the first half of next year.

Lead and spelter have begun to show improvement. Foreign absorption of spelter has been heavy and now lead is being taken in large lots. The tide is beginning to rise. Prices have reflected the improved demand. The upward movement will more than likely continue. While spelter may never again sell at 25, it is certain that a price of 15 cannot be beyond thought. Lead may go back to 8 or 9. Thus the ore producers of the Middle West who have been glum can look forward to an early renewal of prosperity.

Whether antimony, tungsten, aluminum, quicksilver and other metals can again rise to the fabulous prices that have prevailed in the past 6 months is problematical.

The Electrification of Railroads Proves Big Cost Saving.

Under its contract with the Montana Power Co., the Milwaukee & St. Paul railroad is paying at the rate of something like \$550,000 a year for electric power to run its 450 miles on the main portion of its line between Harlowtown, Mont., and Avery, Idaho. It paid for coal to operate its steam trains over the same line approximately \$1,750,000, and the company furnished its own coal from its own mines on its road, and one-third of its equipment was used in hauling coal for its own use. With electric power there is no such waste, and in consequence the saving is enormous.

Another case of large savings is that of the Butte, Anaconda & Pacific railway, an Anaconda holding, which is now paying less than \$100,000 a year for its electric power, whereas formerly it cost near \$270,000 for coal to operate its steam road, a saving of approximately \$170,000 annually.

As a result of these signal successes in electrification, it is a foregone conclusion that but a few years will have elapsed before all roads operating in a mountainous country, where hydro-electric power can be developed cheaply, will operate their trains with electric power.

At the present time nearly 50,000 miles of railroad are operated in the states California, Oregon, Washington, Idaho, Montana, Wyoming, North Dakota, South Dakota, Utah, Arizona, Colorado and Nevada, and as it is estimated that 10,000 hp. is needed to operate 100 miles of single track it will require some 5,000,000 hp. to electrify all the railroads of these states.

As a great portion of the trackage in the above states is over mountains, the use of electricity in place of coal would result in great economy in operation, would largely lessen the dangers of forest fires, and by elimination of noise, smoke, gas and dust would make travel far more safe, comfortable and pleasant than at present.

The wood-burning locomotive of 50 years ago weighed 20 tons; the electric locomotive of today is 112 ft. long and weighs 285 tons. These wonderful motors absorb the mechanical energy of the train going down grade by gravity and return it in the form of electrical energy to substation for use by trains running along the level or going up grade. Thus, through regenerative braking, from 25 to 50% of the power is recovered.

Electrification of railroads means a long step towards true conservation through the saving of coal and the utilization of wasting water powers.

Investment in a prospect is always more or less of a risk, but it can be made less by care. Would-be investors must remember that development is necessary to convert a prospect into a mine. It is assumed that any prospect that is seeking funds for development has showings or indications of ore that warrant taking the risk of putting up money for the work. Investment in a prospect is somewhat of a risk and should be recognized as such. It is assumed here that the venture is being promoted honestly, otherwise the risk becomes a certainty—a certainty of failure. The development of a prospect is a legitimate field for investment, and a necessary one. On such investments depends the future of mining.

Shipments of iron ore on the great lakes during July made a new record at 9,750,157 tons, which exceeded the June movement by 242,581 tons. It had been the general belief in the trade that the June movement had made a record that would stand for the year. Ore shipments to Aug. 1 have broken all former records by more than 5,000,000 tons. The total carried was 29,365,724 tons. The former high record was made in 1913. Carriers now freely predict a season approximating 50,000,000 tons. The American head of the lakes has shipped 20,376,405 tons up to Aug. 1, against 13,678,166 tons a year ago, or an increase of 6,698,239 tons.

Investigators on mining undertakings should be aware of companies that issue incomplete and evasive reports to shareholders. Every shareholder has a right to know the financial condition of his company, the physical condition of the property and other details that have an effect on the security or value of his investment. When officials placed in office by shareholders to manage the company's business affairs for the welfare of all, attempt to maintain secrecy concerning their acts, there is good reason to suspect that all is not well and an investigation is warranted.

Researches in the treatment of low-grade ore have been rich in results particularly with respect to gold and copper-bearing ores. Perfection, however, has not yet been reached and there are still attractive fields of investigation yet to be explored.

PERSONAL.

D. F. Hewitt, with the U. S. Geological Survey, is in Peru, S. A.

Frank S. Baillie is now superintendent of the Baker Mines Co., Cornucopia, Ore.

J. A. Wittier, operating near Slocum, B. C., is in Spokane, Wash., from Vancouver, B. C.

J. W. Boyle, manager of the Canadian Klondyke Co., Dawson, Y. T., is now in London, E. C.

George A. Packard, mining engineer with the Bingham Coalition Mines Co., is in Butte, Mont.

Pope Yeatman, consulting mining engineer, New York, will resume his private practice after Sept. 1.

P. A. Robbins, manager of the Hollinger Con. Mines Co., has returned to Toronto, Ont., from New York.

A. E. Hall has been made superintendent of the mines and mill of the Sable River Copper Co., Massey, Ont.

Nathan O. Lawton will have charge of reopening the old Vermont Copper Co.'s mines at South Strafford, Vt.

George Austin, Wallace, Idaho, manager of the Mammoth mine, Missoula, Mont., has been in Spokane, Wash.

H. W. Leonard, former chief engineer for the Cerro de Pasco Mining Co., Cerro de Pasco, Peru, has left for the United States.

W. Spencer Black, mining engineer, Los Angeles, Cal., is in Pioche, Nev., relative to inspecting property in the Jack Rabbit district.

James F. Callbreath, secretary of the American Mining Congress is in Chicago making arrangements for the society's meeting in November in that city.

George O. Bradley, engineer in charge of construction for the D. C. Jackling interests, has been in Garfield, Utah, from his headquarters at San Francisco.

Carl F. Schaber, mining engineer with the Tennessee Coal, Iron & Railroad Co., Birmingham, Ala., has been in Houghton, Mich., and will go to Jackson, Mich., before returning.

G. H. Wolhaupter, engineer with the Utah Copper Co., Garfield, Utah, has resigned and is now in Houghton, Mich. On returning he will conduct flotation experiments for the Stimpson Equipment Co., Salt Lake City.

D. C. Jackling has recently been inspecting the Utah Copper Co.'s holdings around Salt Lake City, Utah, and left for Butte, Mont. He has also recently been appointed a director of the American Zinc, Lead & Smelting Co.

Charles A. Randall, mill superintendent for the Tough Oakes Mines Co., Schumacher, Ont., has resigned to take charge of constructing two mills for the Simons and Burns interests in Cuba. He will be in New York for some time drawing up plans for construction.

OBITUARY.

On Aug. 6, 1916, Frederick F. Thomas died in Berkeley, Cal. He was born in New York state in 1813 and in 1863 was graduated from Yale. In about 1867 he went to California and operated considerable on the Mother Lode. He was later joined in his adventures by David McClure and together they operated the Gwin property. At one time he was manager of the Central mine, Broken Hill, Australia, and served in the same capacity at the United Verde mine, Arizona, and the Kenedy mine, Amador, Cal. The United Verde he opened up as well as having managed it for several years after.

SCHOOLS AND SOCIETIES.

American Electrochemical Society.—The society has planned a series of interesting meetings and will open its meeting Sept. 28, with a technical session devoted to a review of American progress in the electrochemical industry. A complimentary smoker will be held on Thursday evening and on Friday evening there will be a joint banquet at the Waldorf-Astoria of the members of the American Chemical Society, the American Electrochemical Society and the Technical Association of the Pulp and Paper Industry. This will be a subscription banquet and the price of tickets to members will be \$3.50; additional tickets for guests will be obtained at cost, or about \$7.

American Chemical Society.—Official announcement of the meeting of the society, to be held in New York Sept. 25 to 30, in conjunction with the second National Exposition of Chemical Industries, will be issued to the members by Dr. Charles L. Parsons, secretary, on Aug. 15. Dr. Charles H. Herty, of the University of North Carolina, president of the American Chemical Society, will open the exposition on Monday, Sept. 25, at 2 P. M., with an address reviewing the history of chemistry and the chemical industries in this country and outlining developments since the outbreak of war in Europe. The presidents of co-operating societies, such as the American Electrochemical Society, the American Institute of Mining Engineers and the American Paper and Pulp Association will follow Dr. Herty with speeches of welcome and reviewing the progress made in the industries represented by them. On Wednesday and Thursday morning a general symposium on colloids will be held, theoretical considerations being discussed on the first day and the industrial applications of colloidal chemistry on the second day.

COMMUNICATIONS.

[This department is for the exchange of ideas bearing on all branches of the mining and metallurgical industries. Mining and Engineering World will not be responsible for the statements made nor opinions expressed by correspondents.—Ed.]

The Editor—Several anomalies have struck me on a recent visit to the Menominee range and to the Cuyuna range.

In spite of the activity in mining there seems to be little demand for newly discovered ore bodies. This may be explained in various ways, but no one explanation seems thoroughly satisfactory.

In spite of the above fact there is great activity in exploration on the Cuyuna. Over 30 drills are now running.

Possibly because of the above fact there is very little exploration on the Menominee-Crystal Falls range. Only some two or three drills are running. Is the real explanation here to be found in the exceedingly erroneous taxation laws of Michigan? Take note that there is doubtless far larger area of promising unexplored territory on these Michigan ranges than on the Cuyuna.

Another anomaly: The public is clamoring for the conservation of national resources. And yet the tendency of tax legislation as to mining is decidedly to discourage such conservation.

F. I. CARPENTER.

Barrington, Ill.

NEW PUBLICATIONS.

An Anticlinal Fold Near Billings, Noble County, Oklahoma. By A. E. Fath, Washington, D. C., U. S. Geological Survey. Bulletin 641-E; pp. 18; illustrated.

Gas was struck in this vicinity during February, 1916, in small quantities and at fairly shallow depth. The location of the strike is about 20 miles from any other producing location. But since there was a large anticlinal fold in the

area, which when taken with the formation would indicate possible oil and gas, it was decided to describe the anticline, the country's formation and point out such peculiarities as would make the accumulation of a deposit possible.

Pottery in 1915. By Jefferson Middleton. Washington, D. C., U. S. Geological Survey. Min. Res. of U. S.

Reviews the situation and production in the industry in general for the country, pointing out causes which have affected the same. The production of various states is shown in tabulated form.

Secondary Metals. By J. P. Dunlop. Washington, D. C., U. S. Geological Survey. Min. Res. of U. S. 1:3; pp. 8.

A general description of the sources of secondary metal and the industry in general is first given. Copper, lead, zinc, tin, antimony and aluminum, which are derived from scrap and other old metal are reviewed separately.

Silica in 1915. By Frank J. Katz. Washington, D. C., U. S. Geological Survey. Min. Res. of U. S. 11:8; pp. 6.

A general review of production and conditions is first given and followed by one more in detail and made separately by states. The uses of silica are spoken of and briefs are given on some of the other siliceous materials.

Ozokerite in Central Utah. By Heath M. Robinson. Washington, D. C., U. S. Geological Survey. Bulletin 641-A; pp. 16; illustrated.

Particular veins and deposits are located and described in some detail though for the greater part the bulletin dwells on a general description of the geology of the deposits and formation of the area being considered.

Spirit Leveling in Arkansas, 1896 to 1915, Inclusive. By R. B. Marshall. Washington, D. C., U. S. Geological Survey. Bulletin 636; pp. 56; illustrated. For sale by Mining World Co. 15c.

A list of all of the bench marks established by the U. S. G. S. in the state. The elevation of each and a brief description to serve in locating the same is given.

Asphalt, Related Bitumens and Bituminous Rocks. By John D. Northrop. Washington, D. C., U. S. Geological Survey. Min. Res. of U. S. 11:13; pp. 16.

An economic review is made of the occurrence of asphalts as well as manufactured asphalt. The market is reviewed regarding prices and production and separate briefs are given on the principal producing states in this country and the principal producing countries of the world.

Effects of Temperature and Pressure of the Explosibility of Methane-Air Mixtures. By G. A. Burrell and I. W. Robertson. Washington, D. C., U. S. Bureau of Mines. Technical Paper 121; pp. 11; illustrated. For sale by Mining World Co., 15c.

The methods of testing are described and the effects of the following changes are given: Increasing initial temperature; exposure to high temperature without sparking; increasing initial pressure and decreasing the same; and varying sources of ignition. The results obtained from each of these tests are discussed and conclusions given.

Limestone and Marls of the Coastal Plains of Georgia. By J. E. Brantly. Atlanta, Ga., State Geological Survey. Bulletin No. 21; pp. 300; illustrated.

A geologic review of the formation is first made and classified by the different geologic areas in which the formations occur. The calcareous deposits are then described separately according to the country in which they occur. Under this division analyses of samples and detailed nature of the formation are described as ascertained from operations. Part III dwells on the uses and preparation of the lime and limestone in these deposits. In reviewing methods of preparation, methods of quarrying the material and crushing it are given as commonly practiced in the state.

PATENTS RELATING TO MINING.

Concentrator. Clinton B. Ripley, Joplin, Mo. (1,193,190; filed Nov. 10, 1915.)

Core-Drill. James H. Okell, Los Angeles, Cal. (1,193,468; filed Sept. 8, 1915.)

Ingot-Mold. Charles W. Lummis, Worcester, Mass. (1,192,919; filed Sept. 9, 1913.)

Grab. Dudley James Barnard, East Ham, England. (1,192,490; filed Apr. 26, 1915.)

Stamp-Mill. Henry L. Dokerty, New York, N. Y. (1,192,997; filed Jan. 17, 1911.)

Ore Classifier. William Henry Weigand, Trojan, S. D. (1,192,806; filed June 19, 1914.)

Ore Concentrator. Jacob Lampert, Rapid City, S. D. (1,192,534; filed July 29, 1911.)

Surveying Instrument. Edward Wright Arms, Troy, N. Y. (1,191,936; filed Dec. 3, 1915.)

Drafting Instrument. William Rew Pearson, Sheridan, Oreg. (1,191,990; filed Nov. 3, 1913.)

Method of Extracting Gold. Albert W. Smith, Cleveland, Ohio. (1,193,197; filed Aug. 15, 1911.)

Trip Valve for Oil-Well Pumps. Robert Y. Watson, Taft, Cal. (1,192,587; filed Sept. 28, 1914.)

Swinging Ore Mill. Jacob Lampert, Rapid City, S. D. (1,192,535; filed Jan. 20, 1912; renewed Dec. 20, 1915.)

Process of Volatilizing Metals. Selden Irwin Clawson, Salt Lake City, Utah. (1,192,037; filed Oct. 28, 1912.)

Electric Furnace. Samuel H. Fleming, Cleveland, Ohio, assignor to National Carbon Co., Cleveland, Ohio. (1,192,950; filed Jan. 7, 1914.)

Hoisting Mechanism. Harry E. Jenkins, Joplin, Mo., assignor of one-half to George H. Glade, Joplin, Mo. (1,192,322; filed Sept. 27, 1915.)

Fuel Made from Anthracite Coal Refuse and Process of Making Same. Andrew Schmidt, Philadelphia, Pa. 1,192,942; filed Sept. 2, 1909.)

Propelling Means for Dredging Machines. Lewis L. Chapman, Arthur D. Chapman, and Carl C. Chapman, Celina, Ohio. (1,192,752; filed Jan. 6, 1916.)

Plunger and Valve for Artesian or Water and Oil Wells. Edgar Seckler Goss and Sylvester A. Barrickman, Franklin, Pa. (1,192,619; filed Aug. 19, 1915.)

Loading Apparatus. Francis Lee Stuart, Baltimore, Md. Original application filed Oct. 13, 1915. (1,192,016; divided and this application filed Apr. 7, 1916.)

Treating Phosphates. Christopher G. Memminger, Lakeland, Fla., assignor to Coronet Phosphate Co., New York, N. Y. (1,192,545; filed Dec. 4, 1915.)

Apparatus for use in Connection with the Distillation of Petroleum and Products Therefrom. John L. Gray, Webster Groves, Mo. (1,192,889; filed Dec. 30, 1914.)

Process of Making Coke. Henry W. Buhler and Charles J. Emerson, Boston, Mass., assignors of seven-eighths to George D. Haskell, Boston, Mass. (1,191,943; filed Nov. 7, 1914.)

Rotary Air-Compressor. Otto C. Buss, Havre, France, assignor to Société Anonyme pour l'Exploitation des Procédés Westinghouse-Leblanc, Paris, France. (1,192,855; filed April 15, 1910.)

Placer-Machine. Herman Fesenfeld, San Diego, Cal., assignor of one-fourth to K. L. Kidd, one-fourth to C. T. Davenport, and one-fourth to A. B. Bowman, San Diego, Cal. (1,193,248; filed May 27, 1915.)

Apparatus for Sampling Ores. Fredrick O. Colar, Ash-tabula, and Herbert E. Wetherbee, Cleveland, Ohio, assignor of one-half to Benedict Crowell and Charles B. Murray, doing business under the firm name of Crowell & Murray, Cleveland, Ohio. (1,192,990; filed Oct. 30, 1915.)

TRADE PUBLICATIONS.

Microscopes. The Bausch & Lomb Optical Co., Rochester, N. Y. Catalog; pp. 130; illustrated.

The catalog has been carefully prepared and includes accessory parts as well as complete microscopes. A number of apochromatic objectives are described and are said to be the first ever made by an American manufacturer.

Overhead Mono-Rails. The Randall Tramrail Co., Philadelphia, Pa. Catalog; illustrated.

This system is of particular use in smelters for the handling of molds and materials about the plant. A number of practical views showing the various uses of the system are given. Detail views are included showing safety cross-overs, clamps, hangers, safety switches and plans for the installation of the system in plants.

Weighing Scales. The Standard Scale & Supply Co., Pittsburgh, Pa. Catalog; illustrated.

The catalog is gotten up in pocket size and outlines the features and applications of different kinds of scales. The different types are listed and prices given. Illustrations are shown of the practical uses to which the scales may be put. The contents includes types from small balances to large scales for railroad cars and trucks.

Wire Rope. The John A. Roebling's Sons Co., Trenton, N. J. Pamphlet; illustrated.

Various uses of wire rope are taken up in the pamphlet and the discussion is made clear by the addition of many suggestive illustrations. Physical data of use in designing equipment where wire rope is used, is given as also is data of use in the design of aerial rope conveyors, general wire rope practice and inclined plane operations.

Overhead Carrying Devices. New Jersey Foundry & Machine Co., New York. Catalog 88; pp. 48; illustrated.

Overhead tracking, trolleys, hoists, buckets, cars, etc., make up the contents of this catalog. Each of the many different types of equipment are illustrated, briefly described and accompanied with a table of details and prices. The catalog is not confined to complete equipment only, but information is also given on accessory parts. In the concluding pages storage battery locomotives are considered and illustrations of overhead carrying systems in use are shown.

Traveling Water-Screens. Chain Belt Co., Milwaukee, Wis. Bulletin No. 64; pp. 8; illustrated.

The screens have been designed to clean waters from foreign materials before entering the circuit for use in power plants, steel mills, metallurgical plants, concentrating plants, etc. Views, drawings and description of the equipment and its operation are given. The screens are constructed so that a battery of any number of units may be used to obtain or handle the required amount of water. One sectional drawing is given showing a complete plant installation.

Single Compressors Steam and Power Driven. Chicago Pneumatic Tool Co., Chicago. Bulletin 34-N; pp 20; illustrated.

Two classes of compressors are taken up including class N-SB and N-SS. Illustrations and drawings of the machine are given with tables showing the details of capacity and dimensions for the different sizes in each class. The capacities range from 52 to 1113 cu. ft. of free air per minute. A treatise on the details of construction is given and the concluding pages show a new type of compressor mounted for portable use.

Gyratory Crushers. Traylor Engineering & Mfg. Co., Allentown, Pa. Bulletin G 3; pp 26; illustrated.

With the aid of illustrations both of the assembled crusher and separate parts a clear and complete description of the construction of the crusher is given. A table is included giving the details for different sizes of Traylor

gyratory crushers and a crusher with a short head for fine grinding is mentioned. Revolving stone screens are given attention in two pages. Complete crushing plants are discussed in the last 10 pages. Most of the information is on correct design and crushing practice in plants. Curves and detailed information of value to those interested in crushing plants is given and drawings showing complete crushing plants of both large and small capacities are reproduced. In tabulated form and accompanied with drawings the detail dimensions for use in designing but not erecting, are given. The dimension is designated by a letter on the drawing and in the table under the letter the particular dimensions for all sizes of crushers may be found.

INDUSTRIAL AND TRADE NOTES.

The Intermountain Tungsten Milling Co., of Denver, Colo., is remodeling the Black Cloud mill near Salina, Boulder County, and have given the Denver Quartz Mill & Crusher Co. an order for one No. 2 Denver quartz mill, 8 by 12-in. Denver Crusher and other equipment.

J. R. Fleming & Sons Co., Inc., of Scranton, Pa., have been appointed mine-car bearing representatives in the Anthracite coal district for the Hyatt Roller Bearing Co. They will carry a complete stock of Hyatt roller bearing journal boxes for both inside and outside wheelers.

The large mill at Leadville known as the Yak Mill, situated near the portal of the Yak tunnel, was recently purchased by the Morse Bros. Machinery & Supply Co., and will be dismantled and moved to Denver. This was a 500-ton zinc lead mill equipped with crushers, rolls, roasters, dryers, Cleveland-Knowles magnetic machines, tables, etc., all electrically driven. The original cost of the equipment was over \$200,000.

The Geyser mine at Westcliffe, Colo., equipped with the largest hoisting engine in the state of Colorado, a 28x72 Wester, Camp & Lane double-reel engine, weighing over 400,000 lbs., and a complete plant of boilers, compressors, rails, cars, drills, pipe, etc., is being dismantled by the Morse Bros. Machinery & Supply Co., and is being shipped to their Denver yards for resale. Thus ended the history of the "Dream" Mine, a 2700-ft. shaft, and no ore.

Because of the increasing popularity of oxy-acetylene welding and cutting for the repairing and treatment of machinery in place and especially large pieces which would be difficult to move the Prest-O-Lite Co., Indianapolis, Ind., has issued an instruction book on the process. It is written by H. Sidney Smith and A. F. Brennan, and has been gotten up for the use of those who have little or no knowledge of the system. Practical applications of the process are described avoiding technical language as much as possible. Besides description of methods of using this process description of different types of apparatus is also given. The book is titled "Instruction Book on Oxy-Acetylene Welding and Cutting," and may be obtained for 50 cts. direct or from the Mining World Co.

Another triumph was recently added to the many already credited to the mechanical engineering profession when the Johnson & Barry Steel Co., North Birmingham, Ala., accomplished the almost impossible by restoring 12 large oil tanks, 30 ft. long and 10 ft. in diameter, belonging to the Texas Oil Co., to their former career of usefulness. These tanks were a mass of burned and melted iron, full of great holes, bursted by various explosions during a recent fire. With a "Chicago Pneumatic" Boyer hammer, the tanks were completely cut apart and straightened out. All rivets were removed by Boyer rivet busters and the plates were riveted with Boyer riveting hammers. New iron was used of course to mend the spots where the iron was bursted out. Little giant air drills were also used on this job and a "Chicago Pneumatic" compressor supplied all the air used.

Late News From the World's Mining Camps

Editorial and Special Correspondence.

ALASKA.

Anchorage.

P. R. Strong, from Indian creek, reports his placer claims are showing up and that he has pay.

The Doherty coal mine has been put in condition for production and there are now 1000 tons of coal on the dump waiting to be hauled out. It will sell in this city from \$8 to \$10 per ton. It is employing 30 men at present. The main tunnel, 7 by 8 ft., is driven from the Moose creek entrance and is in 430 ft., with nine shoots in all, 34 ft. apart. The first air shaft is in 90 ft. from the mouth of the tunnel and it is 60 ft. to surface, while the second air shaft at the end of the tunnel, 430 ft., rises 300 ft. to surface. The bunkers with a capacity of 700 tons are being built for storage and the Alaskan Engineering Commission is co-operating to make this mine a success.

Fairbanks.

Mining Inspector William T. Maloney in his quarterly report says that the number of underground placer workings in the Fairbanks section has decreased, but several rich spots have been struck in that region on many of the creeks which will bring the average yield up to the figures of 1915. It is expected that the output from Fairbanks and Tolovana section will exceed that of 1915 on account of increased production from Tolovana. Lode operations in Tolovana have this summer been confined to antimony mining. Over 1000 tons of the ore will be shipped from there during the summer. Of the 10 quartz mills in the section, only one is being operated, and that intermittently. Several small outfits are working on tungsten lodes. Ott shipped 1600 lbs. of the ore by parcels post in March, but it was delayed in delivery until June, when the price had dropped from \$65 per 100 lbs. to \$25.

Cleveland and Howell have been operating with success this past season on Woodchopper creek. Their first clean-made recently is estimated at about \$68,000.

J. W. Toole, a Fairbanks miner, has recently patented a shovel for underground work and now has one on his ground. He took a new generator and motor set in with the shovel. He is operating at the mouth of Fairbanks creek. The shovel works on underground placers and will handle 1000 ft. of bed rock per 24 hours, it is said.

Knik.

Jesse Garber has made a recent strike at the head of Peterson creek. The property is 8 miles northwest of the Martin and 6 miles north of the Gold Bullion mine. In opening up the Jesse B. claim proper Garber took out 15 tons of free milling ore and uncovered 5 leads of milling ore within 150 ft. of each other; with the veins ranging from 2 to 8 ft. wide. The ore is a chloride.

The Martin mine has produced another gold brick and the new tram and bunker were put in commission Aug. 1. The mill at the Mabel mine is crushing ore at present said to assay \$250.

Skagway.

Headed by J. P. Harper and H. A. Kyer, an association known as the Lakinaw & Tagish Co., has taken a bond on the Conrad properties on Tagish lake. Harper in speaking of the work says that they have been operating only 6 weeks. In that time the showing is even beyond their expectations, and while real mining has hardly begun, we have taken out 3 carloads of ore which were sacked and has been brought over and will be shipped to the Tacoma smelter. Fourteen men are employed, but this force is being increased as fast as good men can be secured. The mine has

been sufficiently opened up to make increased shipments during the balance of the summer and throughout the fall and winter. Arrangements are being perfected for the shipment of the ore instead of sacked as at present, and if plans are not retarded the bulk shipments will begin by Aug. 15.

ARIZONA.

Bisbee.

The Calumet & Arizona will shortly start a new working shaft. It will be sent down between Bakerville and the Cochise siding, 1800 ft. deep, 5 compartments, and will be concreted from surface. Sinking the shaft has been contemplated for many months by the management and has become a necessity with the development work of the company and the increasing production. The new shaft will serve as ventilation, development and possibly the hoisting of a large part of the ores from the Junction and Briggs country. Both Junction and Briggs exploratory workings have practically reached a point where the new shaft will be sunk. They are now in the Bakerville neighborhood and some outlet is needed. As to the exact amount of ore found in the lower levels no information is to be had. At present the Junction, which is down 1800 ft., is unwatering the surrounding country. When the new shaft is down 1800 ft. it will unwater another portion of the surrounding workings and aid the Junction in this work. Just exactly when the initial work will be started on the new shaft is not known, but that it will be made in a few weeks appears certain.

Chloride.

Plans are well matured to build a flotation mill of 50 tons capacity at the Keystone mine, owned by G. S. Holmes. The equipment is being supplied by Utah Machinery Co., Salt Lake, the ball mill and Akins classifier to be used being manufactured by Colorado Iron Works; the two flotation cells ordered are the J. D. Fields pattern, this machine being handled by the Utah Machinery Co. There are to be three Wilfley tables. Electric power will be used.

Oatman.

The largest single shipment of corrugated iron into Mojave county has just arrived at Kingman and is being hauled to Oatman. The shipment is for the sides and roof of the new United Eastern mill. More than 60% of the machinery has arrived and work of erecting the structure and placing the machinery will be started at once. Foundations are completed.

The Iowa Mining Co. has resumed operations. The old shaft, which had been sunk on the vein, has been straightened and timbered. It was 300 ft. in depth. The shaft has now reached the 330-ft. point, and a No. 7 Cameron pump is taking care of the water which is coming in at the rate of 40 gals. per minute.

A syndicate composed of Seely W. Mudd, Frank A. Keith, Phillip Wiseman and D. C. Jackling has, according to this announcement, taken over the Sunnyside property, which ajoins the Lucky Boy and Telluride on the south west. This property is near the extreme southeasterly end of the Tom Reed properties, and is believed by geologists to be traversed by an extension of the Tom Reed vein system. The price involved is said to be in the neighborhood of \$100,000. The above gentlemen, with Long and McIver, are owner of the United Eastern, and really financed the operations of Long & McIver when they were developing this property. It is rumored that the same interests are negotiating for the control of the Oatman Queen property,

which lies more directly south of the United Eastern, and in which a considerable tonnage of milling ore has been exposed. Sunnyside, also, has some remarkable surface showings, while the Telluride and the Lucky Boy, in this same vicinity, are regarded as coming mines when they shall have been properly developed.

Development on the 400 and 185 levels of the Big Jim property continues to add large quantities of ore to the known reserves, and it is officially stated that the average value of all ore being exposed is above \$20. Foot for foot of work done to date, the Big Jim is fully equal to the Tom Reed at similar levels, according to assay maps of both properties.

The Tom Reed continues to develop large bodies of ore in its Ben Harrison (its main mine) and its Black Eagle workings. Arrangements are being made to do extensive development work on other parts of its large estate, which extends for some 6 miles across the Oatman district. Indications favor the belief that several large mines will be developed in the Tom Reed holdings. Its mill is now dropping its entire 20 stamps on company ore.

The Gold Road mill is steadily operating on its own ore and on 30 tons per day from the Gold Ore Co.

The Ivanhoe is drifting on its vein on the 500 level, as is the Fessenden.

Work in other properties, such as Carter, Boundary Cone, Arizona, Tom Reed, Oatman Pioneer, North Star, United Northern, Times, Gold Dust, Gold Key, Gold Road Bonanza, Black Range, Jerome Oatman, Lexington, Adams, Nellie, United Western and others is steadily progressing.

Oatman United, delayed for a long time by inability to secure delivery of its 60-hp. engine to drive its compressor, has at last received its engine, and this is now being placed. The big 3-compartment shaft is now down 175 ft., and will be driven to the 500 point with all possible speed as soon as its power drills can be used.

Oatman Queen and Lucky Boy will soon resume operations, and Lazy Boy and Esperanza will follow shortly with resumption of operations.

Eastern capital is now coming into the Oatman district and several deals of magnitude are said to be pending. Large blocks of stocks of a number of Oatman companies have recently been placed in New York, Philadelphia and Boston. A number of these were companies which were none too well-financed at the start, but which managed to get along very well during the first flush of excitement when Oatman development stocks were selling briskly. Now that eastern capital is becoming interested and is being made available for the development of the properties in the district, mining operations are gradually increasing. Nothing has as yet developed in the camp to prove that the opinions of the eminent engineers who reported favorably upon the district were incorrect, but, on the contrary, developments in those properties which are well advanced in their exploration work are exactly in line with the predictions made last fall and winter by such engineers as J. Parke Channing, Etienne A. Ritter, H. C. James, J. K. Turner, C. D. Jackling, Frank A. Keith, Seeley W. Mudd and others. Ore deposits in the district are so deep lying that considerable time—an average of much more than one year—must be devoted to development and exploration work before important ore bodies are to be expected. A number of companies are now approaching the stage where pay ore may be found at any time, and a still greater number are steadily and quietly developing, with the expectation of going several months before developing anything of general public interest. The spirit of optimism manifested among the operators in the district is in striking contrast to the market for mining securities.

Miami.

N. W. Tanner and his assistant W. L. Card, have just returned to Miami, after having spent 3 weeks in the district southeast of Miami, known as Mineral Creek section, examining the property of the Greater Miami Copper Co. The property consists of 20 claims, located, approximately, 15 miles southeast of Miami. A good deal of development work has been done; besides numerous minor shafts and tunnels, a tunnel is in 110 ft., and a contract to push it in 100 ft.

further will be let at once; also two more crosscut tunnels will be started at once. The property has the advantage of plenty of water, sufficient to run a small electric plant the year round. It is the intention of the company to enlarge the present camp and increase the number of men employed. Work on the road is under way, 35 men being employed on a road leading through Russell Gulch and across the company's property. There is also a crew of railroad engineers making a survey along, approximately, the same route as this road.

CALIFORNIA.

Darwin.

The Darwin Development Co. has completed a flotation plant at the Lane mine and will have it in operation by the end of August. The management reports a large tonnage of good-grade ore available, and if the process proves as satisfactory as anticipated production will be maintained on a large scale.

Two shoots of excellent ore have been opened in the Custer mine, managed by John H. Thornkike. Portions of the vein contain some of the richest ore ever found in the property. Important discoveries have been reported from the Lucky Jim and Christmas Gift properties. The latter is operated by Skinner Bros.

The 300-ton mill of the Tungsten Mines Co., at Tungsten City, has been completed and will go into operation within 10 days. Mule teams are hauling ore to the bins, and the motor trucks will be placed in service before the end of the week. The tunnels and shaft at the mine continue in ore of good grade.

The deposit of zinc carbonate recently uncovered in the Cerro Gordo mine, at Keeler, is proving the most extensive ore body of its kind ever found in the old producer. It was intersected 500 ft. southeast of the shaft, on the 200 level, and is 25 ft. wide. The new winze has gone down on the ore 40 ft. with the vein increasing. The ore is stated to average 25% zinc and occurs as a replacement in limestone. The company is shipping 700 tons of ore and 1500 tons of material from the old slag piles every month.

Downieville.

Henderson & Hodgkinson are driving a new tunnel to intersect the vein in the City of Six mine at a point 60 ft. below the bottom of the 40-ft. shaft. It is expected the objective will be gained within 125 ft. Following this the main lower tunnel, now in 1300 ft., will be continued to the ore body. Some good ore has been exposed in the shaft workings.

Dolan & Bell have erected a small quartz mill at their Rock Creek property and are ready to start crushing. A shoot of rich mill ore has been opened for 100 ft. and 35 tons of selected quartz are ready for the stamps. Arrangements have been made to prosecute work at further depth.

Engineers said to represent the Jackling Exploration Co. have taken options on several groups of low-grade gold properties near Downieville and are sampling the quartz. It is reported an experimental mill is to be constructed to facilitate thorough testing, and that satisfactory results will be followed by the construction of a large plant.

Alleghany.

The Twenty-One mine is idle as a result of an injunction filed against it on behalf of the Sixteen-to-One Co. The latter charges the Twenty-One owners with extracting ore from plaintiff's property, and has entered suit for \$100,000. The Twenty-One people maintain that the other party has invaded Twenty-One territory and are arranging for an injunction against the Sixteen-to-One. Considerable rich ore has recently been opened in disputed territory.

Auburn.

Control of the Borealis Con. group, in the Ophir district, has passed to a syndicate of New York people headed by J. C. Winters. A 100-ton flotation unit is to be installed and the old mine plant replaced with modern equipment.

The group comprises the Eureka, Kirkland and Hataway mines, and contains extensive reserves of good ore. E. P. Stephenson, of Auburn, is manager.

Forks of Salmon.

The Gold run mine, 9 miles from this point, has been purchased by New York capitalists from W. L. Beall, and preparations are being made for operation on a more extensive scale. The mine is equipped with a 10-stamp mill and mine equipment, and contains much ore of good grade. It was recently reopened after lying idle several years.

Ione.

The shaft at the Allen copper mine is down 500 ft. and stoping has commenced on a large block of good ore. The vein averages 5 ft. wide and carries copper and gold. Large reserves are exposed and shipments will start in the near future. C. N. Johnson, of Cutter Creek, is manager.

Washington.

The stamp mill formerly operated at the Grover-Murphy mine, near Nevada City, is being assembled at the Ocean Star, recently acquired by the Columbia Co. Mines Co. A large amount of new work is proceeding in the mine with encouraging results. Good ore is going to the Columbia Con. mill from the Columbia property. Much new work is in progress at the German claim.

Shipments of chrome ore are going to eastern steel mills from the Red Ledge mine, and the vein shows strength as developments advance. The gold bearing ore bodies continue to develop well and a good tonnage is going to the mill.

Nevada City.

The mill at the Texas mine, in Willow Valley, is crushing good-grade ore and the company operating the property under bond has arranged for greater operations. Arrangements are also being made to work several adjoining claims by way of the Texas shaft. W. H. Tuttle is manager.

Roy Tremeroux, assistant superintendent of the Champion mine, has been selected to manage the Delhi mine at Columbia Hill, which is being reopened by local capitalists. Unwatering of the lower levels is proceeding and as soon as this has been accomplished a larger pump will be installed and sinking resumed. The mine is equipped with a 20-stamp mill and excellent mine plant.

Atolia

Heavy shipments of high-grade tungsten ore continue to be made by the independent companies, and new work is constantly extending the productive zone. A large acreage of new ground is being worked between Atolia and Bandsburg and leasing companies are particularly active.

Chico.

C. L. Crowder and W. H. Whitten of Chico have bonded their Mugford gold mine to a Nevada company. The property has produced well in the past and the new operators have started work. The Mugford lies 16 miles east of Chico.

Lotus.

The new shaft at the Wagner mine has intersected at a depth of 60 ft. a 4-ft. vein of ore averaging \$35 to \$40 in gold. A 4-stamp mill, compressor, 22-h.p. gasoline engine and other equipment have been recently installed, and plans have been made to send the shaft deeper. The Wagner was extensively worked 20 years ago but has long lain idle.

Tungsten City.

The Standard Tungsten Co. is erecting a 1600-ft. gravity tramway, a new mill with a capacity of 10 tons, and other equipment. This will increase the output of tungsten concentrates fully 80%. Developments continue to uncover good bodies of tungsten-bearing ore.

Yreka.

W. R. Beall of Yreka has made the first payment of \$10,000 on the \$20,000 purchase price of the Gold Run mine, near Forks of Salmon; 20 men are at work and 10 stamps are dropping steadily. Beall reopened the Gold Run several months ago after the property had lain idle 5 years. Large deposits of copper ore have been found in the Forks of Salmon district and it seems likely the region will attract much attention in a mining way in the coming year. Numer-

ous gold ledges are being prospected with encouraging results. The district lies near the new government road from Forks of Salmon to Somes bar and is readily accessible for the first time.

Oroville.

A deposit of rich gravel has been encountered in the Butterfly mine, in Morris ravine, 4 miles from Oroville. It was tapped at the end of a 500-ft. tunnel and appears to be 4 ft. thick. Crosscutting is proceeding to determine its width. Among the principal owners are C. F. Belding, R. S. Kitrick, W. T. Baldwin, C. L. Bills and Herman Legrunde.

The Big Blue Lead gravel mine, near Bangor, has been acquired by F. F. Ford and C. G. Fowler, and arrangements have been made to work it along broad lines; \$20,000 will be expended on development work, and the 2500-ft. tunnel will probably be extended to intersect a series of rich channels believed to course through the property. The property lies about 10 miles from Oroville and is in one of the richest placer sections of California.

COLORADO.

Cripple Creek.

Under Supt. Kissel shaft work is progressing at the War Eagle Con. A new electric fan for use in sinking the Happy Year shaft has been installed. This 3-compartment shaft has obtained a depth of 125 ft., and is gaining at the rate of 3 to 4 ft. daily. The shaft is timbered with Oregon pine. A station has been cut out at 125 ft. and a crosscut is being carried east in close proximity to the main Happy Year vein, lying an estimated distance of 40 to 50 ft. east of the new shaft, and between it and the old Josephine shaft. This old shaft, although but 70 ft. deep, is accredited with a total production of close to \$70,000, when litigation stopped further operations. The lateral from the Happy Year shaft, lower down the hill, will cut under the old workings on the Josephine at an approximate depth of 150 ft., or 75 ft. deeper than the level from which the output was made. It is expected that with the vein tapped paying values will be obtained. The 200 level of the Happy Year shaft is planned to connect with the Happy Year tunnel workings. In driving this tunnel a basalt dike was followed and numerous cross veins intersected. The low values obtained in these veins was too low to permit of development, but such grade may now be mined at profit. Connection with the tunnel will also ensure perfect ventilation, and until this work is completed, the electric fan will be kept in operation. The old Happy Year shaft is between 400 and 500 ft. deep and was sunk in granite. Samples, it is said, range from \$14 to \$10.

A vertical vein at the Ella W. is now being prospected by a winze from the 100-tunnel level. It is showing up good and assays are as follows: Coarse quartz 3.33 oz. gold \$66.60 and screenings 4.32 oz. gold \$86.40. These samples were taken from the 4 ft. of vein matter as broken with machine drills. The first shipment of the higher grade quartz, a carload to be loaded out by teams of the Colorado Trading & Transfer Co., will, it is estimated by the mine superintendent, bring settlement at a rate of between \$35 and \$40 to the ton. A carload of the richer screenings will have accumulated by the end of the week and will then be shipped from the lease by the Consolidated Mines & Reduction Co.

The Jerry Johnson produced \$25,632.50 in ore during the first 6 months of 1916. During this time 33 lots of ore were consigned to mill or smelter and values as shown in the report of Supt. D. C. Smith, of the Cripple Creek Deep Leasing, Milltown Extension combination, ranged from 0.5 oz. gold \$10 to as high as 3.01 ozs. gold \$60.20. The company's lease extends from the 650 level of the main Jerry Johnson shaft downwards. The Deep Leasing Co. is mining and shipping a good grade of ore from the bottom or 850 level. A crosscut at the 750 level now being carried to the breccia-schist contact should reach the objective point by Aug. 14, when it is expected that another ore shoot will be entered. During July the production made by the Deep

Leasing Co. totaled 9 cars or 300 tons of ore that averaged better than 1 oz. gold.

Idaho Springs.

In Buttermilk Gulch, the old Queen mine on Seaton mountain is to again be operated after an idleness of 25 years. The property is to be worked for tungsten. Oscar Hayes, Dr. Polly, Denver, and his brother, a Cripple Creek mining man, have formed a company known as the Polly Brothers & Hayes Co. They have obtained a lease and bond on the property from the Holly Mercantile Co., Central City, and have started work. In the early days the property was worked for silver. They have built ore flats and put a hoist at the 20-ft. shaft from which they are producing tungsten. In an old shaft, sunk when everybody was looking for gold and silver, there is a 2½-ft. streak of tungsten that shows 24%. At the present market price this is worth \$12.50 per unit. The shaft was sunk the entire distance on a vein which averages about 2½ ft. wide, work on the shaft being abandoned because the vein matter showed no gold or silver and tungsten at that time was undesirable. The old dump is most all tungsten, and in the bottom of the shaft the streak is 3 ft. wide and shows better value than tungsten.

Silverton.

Shipments from this camp during July were as follows: Davey Leasing Co., 37; Gold King, 36; Sunnyside, 31; S. D. & G., 17; Iowa-Tiger, 16; Congress Mine, 13; St. Paul, 13; K. P. & G., 9; Davey L. & M. Co., 7; Genesec, 7; Davies Lsg. Co., 6; Atlantic Lease, 1; Kittimac, 3; Nevada Lsg. Co., 3; Pueblo Mine, 3; Big Giant, 2; North Star, 2; Pride of the West, 2; Barstow Mine, 2; Silver Ledge, 2; Intersection, 1; Silver Lake Mine, 1; Highland Mary, 1; Harding Sub-Lease, 1; Rogers Lease, 1; Kansas City, 1; Joker Tunnel, 1; Hudson Lsg., 1; Morgan & Chino, 1; John A. Johnson, 1; Andren & Jackson, 1; total, 227. This is 118 more cars than were shipped from this camp a year ago.

IDAHO.

Arco.

Wilbert Mining Co., whose mine and mill are 40 miles from Arco, on the Blackfoot-Mackay line, is shipping about 225 tons per month of concentrates, running 50 to 55% lead, and 5 to 15 ozs. silver, which is handled at Salt Lake by Knight & Warnock.

Gilmore.

The Pittsburg-Idaho Co., the Gilmore Mining Co., and the Latest Out Mining & Smelting Co., all operating at Gilmore, are shipping lead carbonate ore to Knight & Warnock, ore shipping agents, Salt Lake, for smelter markets at that place. These ores sample 33% lead, 15 ozs. silver and 60 cts. gold. The Pittsburg, H. F. Ellard, manager, produces close to 50 tons per day; the Gilmore, managed by E. C. Ross, recently began shipments, which now amount to 5 to 7 cars per month; Latest Out, D. Nichols, manager, is shipping about 15 cars per month.

LAKE SUPERIOR.

COPPER.

Houghton.

Mass tonnage is about 1200 daily and the yield per ton is remaining about the same, nearly 16 lbs. The opening of another shaft, as was announced a short time back, will have to be deferred for some time owing to the difficulty in getting new men.

Adventure is progressing in retimbering the shaft below the 80-ft. collar and is now down about 70 ft.; this work is somewhat slow owing to the poor condition of the old timbers. The management is pushing the work as fast as possible to take advantage of the high prices of metal.

Victoria will increase its daily tonnage with the one skipway and the old hoisting engine after some improvements have been made at the mill, to about 700 tons. The

skipway will have the rails laid to the bottom level, the 26th, and the hoisting engine ready about Sept. 1. The 19th level west has been very good and it gives promise for a large block of ground from the 15th level to the 22nd which has never been explored.

Copper Range now has a force of men—in fact, all that it can employ—and will increase its tonnage, though no effort is being made for a great increase; whatever additional tonnage is produced will come mostly from the Champion. This mine is preparing to concrete its collar at the No. 4 shaft. It is likely that the other three shafts at the Champion will be improved in the same way. The change has been made at the three Trimountain shafts, but it is not required as yet at the Baltic.

New Arcadian has holed through its new shaft to the 50 level, and as soon as the plat or loading station has been cut out, drifting will be pushed both ways. The 900 level has reached the New Baltic boundary and this work will be discontinued; the ground there for the past few weeks has been as rich as at any place in the mine. The shaft is down about 110 ft. below the 1250 level and is being pushed along rapidly with two drills.

Houghton Copper has, it has been quite definitely established, found the West vein of the Superior mine with copper constantly in the north drift, with a stretch of 20 ft. that has good values. The drill will soon be shifted to the south side of the shaft towards the Superior. On the 12th level the Northern drift is in the same good ground, and a distance of about 70 ft. has been covered, almost all of which has commercial grades.

South Lake has sent its mineral to the Quincy smelter, but it will have to wait until the large drop hammer that is used to break off waste rock from the masses is received and put in position at the rock house. This hammer is expected daily. In about 2 weeks or so the smelting will take place. The same values are being taken out, the Butler lode being somewhat better than the others.

Isle Royale has been shipping between 3100 and 3300 tons daily, and is now pretty close to the former figures. In addition it is keeping up the development work as previously stated. The present daily tonnage, as large as it is, will appear small in another year or two, because the aim of the management of this low-grade mine is the greatest tonnage possible. The connection will be made between the surface and the 5th level at No. 7 shaft during the present month. The whole bottom, that is, the lower levels, is disclosing very good rock.

Carp Lake's force of 12 men under Supt. Rourke have cleared out a third shaft, which is about a half mile east of No. 9, the first shaft reopened, and a mile east of No. 11, subsequently unwatered; all of these shafts show the 6-ft. strip, the upper mineralized portion of the 300-ft. wide sandstone bed with rich copper, and at No. 9 a crosscut has recently determined the lower mineralized strip 10 ft. wide to be as rich as where opened on the face of the cliff. The drift on the tunnel from the surface at No. 9 shaft will now be cleared of its caved ground and crosscuts driven into the lower mineralized strip. It is proposed to mine the copper by opening an adit in from the west about 1500 ft. below the top of the bed, and then to hole through a shaft on the bed by sinking and raising. So far wherever opened the two strips of copper ground average just as good as when they were first examined in this recent period of exploration.

Algonac is waiting now, as it has completed its diamond drilling, for the managing director, Angus Smith, of Detroit, who will probably arrive here this week and consult with John R. Stanton, one of the pool that owns this property, and the president of the Mohawk, Wolverine and Michigan and other properties, who is making his summer inspection of the properties in which he is interested. This property lies between the Nonesuch to the east, and the White Pine Extension to the west, is owned in thirds by Angus, representing himself and his family, T. F. Cole and J. R. Stanton.

Michigan has 7 to 10 ft. of excellent stamp rock in a new lode encountered by the exploratory crosscut, which

is to pass through all the lodes of the Knowlton and Evergreen series, about 180 ft. from the line of the shaft. It is most likely that this lode is the Ogimah; at any rate, it is very close to the strike of that lode. After it has been traversed for its entire width, it is probable that it will be opened up by drifting. With the Knowlton, Evergreen and the North lodes of the South Lake yet to open, and the success at the Butler and Ogimah, it seems probable that one or two lodes will prove commercially profitable—sufficiently to make a paying property. That the mine is earning more than its expenses seems to be a fact, but this cannot be fully determined until the product has been smelted.

Allouez is having its steel frame work so altered that one of the largest sized crushers—the same size and type that has been installed at the Calumet & Hecla and many of the shafts of its subsidiaries during the past few years so successfully—built in the shops of the Calumet & Hecla, can be put in at its No. 1 shaft. This new crusher will be used in conjunction with the tilting pan or apron that has been just constructed, and will effect a great saving through its ability to handle more rock. No. 2 has had this improved equipment for some time. Sufficient men are to be had here, so that this is one of the properties that is not falling off in its daily tonnage. This mine, as is generally conceded, has as promising a future as any in this district.

Cherokee is now down about 30 ft. with its shaft, and is constantly disclosing the same great amount of mass, both large and small, as at first. The shaft is now wholly in the lode, and these good values completely cover the bottom. A mining engineer who is as well acquainted with the lodes of this portion of the mineral series as any man in the district, visited a short time ago this property, and says the showing is very good, and of such a nature that it is likely to persist, with of course the usual poor and barren stretches, as in all of our lodes, especially the amygdaloids.

IRON.

Duluth.

Since a 1-in. raise in the water level allows the lake ore boats to carry about 80 tons more per trip this season has been favored in that the Great Lakes' water level has been high. Another high shipment record was made during July, which, even for the Mesabi strike, surpassed all previous months. It was 9,750,157 tons, against 9,507,576 tons in June. It now looks as if the total shipments for the season would come close to 60,000,000 tons, as 29,365,724 tons has been handled to Aug. 1. The furnaces need the ore and the shippers are going to do everything possible to get the product there. The ore shipments by ports for July were as follows: Escanaba, 1,011,368; Marquette, 680,779; Ashland, 1,302,682; Superior, 1,986,631; Duluth, 3,012,492; Two Harbors, 1,723,205; total, 9,750,157.

Ironwood.

In electrifying its mines on the Gogebic range the Oliver Iron Co. has let many large contracts for machinery. The largest contract went to the Wellman, Seaver, Morgan Co., of Cleveland, which will construct five man hoists and five ore hoists for the A, C, D, E and H shafts of the Norrie-Aurora group. The hoists will be 12 ft. in diameter and will be built of cast steel. They will be driven by Falk herringbone gears, operated by a forged-steel pinion on the motor shaft. Four of the hoists will be for operating 5-ton skips in balance in inclined shafts and the other will be for operating skips of the same size in a vertical shaft. The maximum rope speed for the ore hoists will be 1500 ft. per minute, while the maximum speed of the man hoists will be 1000. Each ore hoist will be operated by a 900-hp. 3-phase, 60-cycle, 2200-volt induction motor, with primary control and liquid rheostat secondary control. The man hoists will be operated by similar synchronous motors of 500-hp. The speed of the motors will be 360 revolutions per minute. The contract for the hoist motors, the generator set and a turbine was given to the General Electric Co. The Sullivan Machinery Co. was awarded a contract for two air compressors, with the necessary electric equipment to operate them. Each machine will have a capacity of 2250 cu. ft. of free air delivered. The motors will be 400-hp. each.

The Lake Shore Engine Works will construct three small, double drum hoists. Two will be placed in service on the Gogebic range, and the other will be installed at the Dober mine, Menominee. These four contracts will require the expenditure of about \$400,000. It is estimated the Oliver Co. will spend \$1,000,000 when the intended work is completed.

Ishpeming.

Contracts have been let by the Cleveland-Cliffs Co. to J. S. Wahlman for a new office building at the Cliffs Shafts property and to Victor Carlson for a dry house at the Homes mines near Gwinn. The dry house will be of brick construction and in most details similar to the one at the Cliffs Shafts mines. Work will be started immediately on both buildings.

MISSOURI-KANSAS.

Joplin.

The week just closed showed a general shutdown of many of the mines in the sheet ground and the low-percentage disseminated camps of the district. Just the number of plants that have closed down has not yet been determined, but it has been very large, and the announcement of many others just as soon as they can clean up their mines has been made. Not a single mine is now running in the Wentworth camp, which formerly shipped from 6 to 8 cars per week. The West Joplin disseminated camp shows a majority of its mines closed down, while the Webb City field shows very much the same conditions. Only those camps with very rich ores continue to show a regular production, and even in these camps the surplus tonnage is mounting rapidly, because the operators are unable to sell their product. This condition must eventually force the closing down of even these mines, unless there is an improvement in the market which will increase the demand for ores sufficient to take up the surplus tonnage now in the field. This is the first month after the expiration of many of the powder contracts, and this has resulted in a higher cost for powder for these mines. This has been one of the main factors in forcing the closing of mines all over this district. There are still a few contracts that have not expired, but each week sees the expiration of one or two.

On the other hand, there have been a large number of properties in those camps of the district subject to overflow, and which were flooded 3 months ago by the heavy rains at that time, which are just now getting their ground drained and are ready to return to production. Most of these are properties with rather rich deposits of ore and can afford to operate at lower costs than the majority of the mines in the field. It is probable that these mines will replace a number of those shut down and will thus help maintain production. Among these mines is the Buckeye of Cave Springs, which has just been pumped out and is ready to resume operation. Another is the Ethel Gray at Chitwood, the entire Lone Elm tract northwest of Joplin and a number of plants in the northwest Joplin area.

MONTANA.

Butte.

Report gives the Anaconda July production at 28,200,000 lbs. of copper. The monthly output for the year so far was as follows, in pounds: January, 23,200,000; February, 23,300,000; March, 26,600,000; April, 33,300,000; May, 30,000,000; June, 28,100,000; July, 28,200,000.

W. L. Creeden, general manager of the Davis-Daly property, in a recent interview states: "Davis-Daly gives indications of developing into a profitable mine. We have pinned our faith on the Hesperus ore body, which has been definitely located on the 2500 level. At this point the ore body has been opened for 450 ft. in length, with an average width of 12 ft., the ore assaying between 5 and 7% copper. The breast of the drift on this level is still in ore. The development contemplates openings above and below the 2500. A

drift is also being run in the 2400. The new hoist should be in commission by October, when production should be doubled—the present 135 tons per day. The aim is to keep income and outgo balanced pending the time when Hesperus ore body has been developed to a point where a substantial tonnage of ore can be economically mined. With copper at its present prices it is figured that the Hesperus will easily pay for its own development. Davis-Daly has about 200 acres of mineral ground. Aside from the favorable showing in the Hesperus, Davis-Daly has a good asset in its Hibernia claim, which lies next to the Nettie property. No work is being done on the Hibernia at present.”

Articles of incorporation have been filed by the Montana Mining Co. The incorporators are A. J. Haggerty, John Couch and Steve Mihelich. The principal office is to be in Butte. The capital stock is \$100,000, non-assessable, and is issued in 100,000 shares of a par value of \$1 each.

The Colusa-Leonard Extension Copper Mining Co. has deeded its property to the Syndicate Copper Mining Co. all of the stock which the Colusa-Leonard owns. An agreement has been entered into with the Tuolumne Copper Co. to sink the Colusa-Leonard shaft to the 1600 level, and there a crosscut will be made. When the Tuolumne Copper Co. has finished its contract it will own 51% of the Syndicate Copper Mining stock, and the Colusa-Leonard Co. will own the remainder of the stock, which will be issued in one certificate. Work has been resumed and the superintendent in charge states that he will be shipping copper ore from the Colusa-Leonard claims as early as September first.

Great Falls.

Work will be started at once by the Montana Power Co. upon the enlargement of the hydro-electric plant at Rainbow falls. This announcement was made by Frank W. Kerr, general manager. The proposed changes will mean the providing for an additional 130,000 hp. and will cost approximately \$500,000. Plans for the changes will be made under the direction of Henry A. Herrick of the Charles T. Main Co. of Boston, original designers of the dam and power house. The construction work will be in charge of Frank Scoten. This installation, in view of the construction of the Holter power plant of 50,000 hp., serves to demonstrate to a degree the heavy demands now being made upon the power company for electrical energy.

Libby.

The mill which is being built by the Rose Con. Mining Co. will be completed and placed in operation this month. The company has been at work for some time running the tailings from the old dump on tables for recovery of tungsten values. Oscar Nordquist, manager, says it is expected that these values will produce sufficient to pay the cost of the mill. All the machinery for the 10-stamp mill is on the ground and is being assembled rapidly. Another force of men is engaged in getting out timber for the mine. A crew is employed in the mine, the work at present being on the raises between the 1st and 2nd levels. The ore runs about \$16 in gold. Estimates as high as \$18 have been made. The ore also carries profitable tungsten values.

Race Track.

Anaconda people have organized a company to develop a tungsten property in the Danielsville district. The company will be known as the National Tungsten & Silver Mining Co., and the officers are: W. R. Brown, president; J. J. Hammers, treasurer; Austin Adams, secretary, and W. J. Hunter, engineer. Anaconda will be the headquarters.

NEVADA.

Goldfield.

The first 500-ton flotation unit of the Goldfield Con. has been in operation a month, with results entirely satisfactory. It is planned to have the second unit of like capacity in service during August. Developments in the lower levels of the Mohawk and Red Top-Laguna are proving highly satisfactory, confirming the belief that ore of excellent character existed on the deeper levels. On the 600 level of the Mohawk

ore averaging from \$11 to \$17 gold and copper is being opened; \$17 ore is coming from the 600 workings of the Red Top-Laguna. On the 260 level of this property some \$42 ore was recently intersected. The triplex pump formerly in operation on the 1350 level of the Goldfield Merger has been moved to a like point in the Grizzly Bear shaft of the Consolidated and will handle water from it, Atlanta and the Merger.

The main shaft of the Silver Pick has advanced to a depth of 850 ft. and interesting developments are expected. As soon as the shale-laitite contact is gained a crosscut will be extended to open the body of ore recently indicated by the Calyx drill. The company has completed installation of a 65-hp. hoist and a more powerful pump. The drill operating from the 500 level has gone down 600 ft. and intersected three veins without disclosing the shale.

Streaks of rich ore continue to show in the 6-ft. vein recently intersected at a depth of 240 ft. in the Great Bend, and Engineer J. K. Turner believes the work is nearing a strong body of good ore. A shipment of the rich quartz is being prepared and arrangements made to drive a new level to strike the ore body at greater depth.

The enlarged flotation plant of the Florence Goldfield Co. is in operation and being steadily worked up to capacity. The management reports the mine in the best shape for several years, with considerable shipping ore exposed on the 600, the present deepest working level. The shaft is 1100 ft. deep and it is understood extensive work from the deepest levels is projected as soon as the flotation plant begins to earn profits.

The management of the Atlanta is preparing to double the working force and to drive the crosscut from the 1750 level. This work is being done with a view to intersecting the Consolidated vein. It is rumored the company is arranging to have a fair tonnage of ore treated at the Florence flotation plant. About 20 other properties are active, with developments in the Lone Star, Kewanas and Sandstorm-Kendall holding much of promise.

Austin.

A leasing company, composed largely of Cleveland people, has arranged to operate the Maricopa mines in New York canyon. Work will begin within 30 days. A good tonnage of medium-grade ore is exposed. Earl G. Hill is manager.

Development has been resumed in the Austin-Dakota group. The power house has been finished and the new compressor plant is in operation. Sinking of the X-Ray shaft is proceeding rapidly and lateral work will soon start.

Contact.

Regular shipments of high-grade copper ore are maintained by the properties of this district. The Seattle-Contact Mining Co. has shipped 35 cars since Feb. 14, averaging 12% copper, 30 ozs. silver and 30 cts. to \$2 gold. The mine has been opened to a depth of 275 ft. by tunnel and winze. Ore bodies range from 2 to 10 ft. wide. A shaft is being sunk and a hoist and compressor have been installed.

The Mt. Helene Development Co. is working the Bonanza group with good results. On the Mammoth group the Nevada Copper M. M. & P. Co. is opening wide bodies of good-grade ore. Two 5-ton trucks and several 4-horse teams are engaged in hauling ore to Rogerson, Ida., 35 miles distant, from which point it is sent to Salt Lake smelters. A movement has been launched for the building of a custom plant embodying the flotation process.

Battle Mountain.

James Dahl has carried on placer mining every season since 1912 at the mouth of Copper canyon, 20 miles out from Battle Mountain. He takes water from Willow creek and brings it down by a 4-mile ditch that carries 3-second-feet of water, and discharges it into a reservoir 60 ft. wide, 150 ft. long and 6 ft. deep. By this means he provides water sufficient to sluice 250 cu. yds. in 24 hours. The material handled is cemented gravel, and has to be blasted in some cases, and where it is not blasted picks have to be used before shoveling. The stuff is hauled in cars by mules and dumped into the ore bin at the head of the sluiceway. The pay gravel is found on a shale and porphyry bed rock. It is taken out by

drifting up-stream on bed rock, the drifts in places being 5½ ft. high and 40 to 60 ft. in lateral extent. This requires thorough timbering. This excavating extends about 2 ins. into the bed rock. A tunnel is being driven at a lower point to open a new channel, 45 ft. below the old or false bed rock. With a force of 50 men about 150 yds. per day are being mined and sluiced. This is understood to run \$2.50 per yard in gold, and possibly higher. Previous to this year a big yardage of gravel was mined and sluiced which ran at least \$15. Other placer ground above these holdings is reputed to be rich, but they are not being operated.

The Copper Canyon mine of the Glasgow & Western Co. is under option to a New York syndicate, represented by F. Sommer Schmidt, of Battle Mountain and Salt Lake. In this syndicate are some of the men who are concerned in United Verde Extension, Arizona. This property was located in 1866, and in the early days of mining in Nevada, 40,000 tons of ore running 40% copper were shipped from this mine to Swansea. The property has a 590-ft. vertical shaft, from which there was extensive development down to 470 ft. Present operations, under direction of Mr. Schmidt, consist of unwatering the mine, the water level last month being at 440 ft. As soon as the workings are clear of water the old levels, started at 530 and 590-ft. stations, will be driven to the ore, those stations being off the vein in the foot wall. The vein strikes north, and dips 65° west, and if the ore shoot that was opened in the upper workings continues with depth much ore can be mined without sinking deeper. The ore consists of chalcocite, cuprite and native copper, with some argentite. Equipment for pumping, hoisting and drilling are in position.

Hill Top.

Kimberly Con. Mines Co. is operating a 10-stamp mill on gold-bearing quartz, assaying \$13, recovering 72 to 75% of the gold on amalgamating plates. E. Ross Carver, manager, states that the company's cyanide plant is to be started in the next 30 days to treat iron-sulphide ore, carrying gold, which has been developed in deeper workings. The plant is equipped for fine pulverizing and the all-slime process of cyaniding, and filtration by Oliver continuous filters. Machinery is all operated by Fairbanks-Morse oil engines.

Tuscarora.

The De Vol-Sheehy mine, 33 miles north of Tuscarora, has free-milling gold ore which is being treated in an arastra. The intention is to erect a 450-ft. aerial tramway and install a mill built by the Straub Mfg. Co., Oakland, to recover the gold by amalgamation and table concentration. The ore is taken from open cuts and drifts on a vein which is exposed a distance of 300 ft. It is said that 20 tons treated by arastra averaged \$125 per ton. In addition to gold, the vein contains hematite, carrying silver and galena.

Pioche.

An option has been taken on the Uvada Copper holdings for \$150,000 by New York people, the option extending over a period of 50 days. The company owns properties in Nevada and Utah, including the Day-Bristol group near Pioche. Heavy shipments of good ore have been going out from this mine for several weeks.

The Hamburg Mines Co. is installing air drills preliminary to more extensive developments. The ore being shipped averages around 15% lead, 15 ozs. silver and \$1.50 gold.

Pioche.

The Prince Con. company, which owns 120,000 tons of mill tailings at Bullionville, lately started its mill to treat them by oil flotation. These tailings resulted from milling operations 40 years ago, Pioche ores having been milled there on account of the water supply in Meadow Valley, Wash. The material here runs about 7% lead, 11 ozs. silver, and \$2.60 gold. The sands are about 40 mesh, and the slimes 200. A more explicit description of this mill will be given later.

Prince Con. Mining & Smelting Co., controlled by A. H., M. C., and E. L. Godbe, Salt Lake, is shipping 15,000 tons of carbonate and oxidized ore per month to Salt Lake smelters, the approximate content being 3 to 5% lead, 3 to 7 ozs. silver, and 35% excess iron manganese over silica. Shipments of ore have been continuous for the last 3 years.

A. H. Godbe, president of the company, estimates 18,000,000 tons of ore in the mine. The main deposit is said to be 1500 ft. long, 1000 ft. wide and 120 ft. thick. It is opened by levels run from a 600-ft. incline, which reaches a vertical depth of 500 ft. All ore is being mined above the 600, which is at water level. Diamond drill holes sunk, show the existence of bodies of sulphide ore below water level. The company owns the railroad, 9 miles long, extending from Pioche to the mine, connection being made at Pioche with the Salt Lake railroad. M. C. Godbe is general manager.

Belmont.

Spanish Belt Mining Co. is driving a 1400-ft. crosscut tunnel to tap the workings of the mine at the 600 level, to drain the mine, which is filled with water. The ores are sulphides, containing gold and silver. Plans contemplate the building of a mill. Victor Barndt is general manager and D. H. Walker is superintendent. The mine contains some lead and cinnabar.

Beatty.

Bull Moose mine, under option to Tonopah-Belmont Development Co., Tonopah, is being developed by that company, the work being under direction of John M. Fox, E. M. In this property low-grade gold ore occurs in a series of sedimentaries, bedded limestone, shales and quartzites, the gold being in the fracture zones, cutting the series. They have a gasoline operated air compressor for hoist and drills, the power costing \$2.90 per horsepower month, by using 27° oil. Development is being carried on from an incline winze, by laterals through the reef. The property is 9 miles south of Beatty.

Sodaville.

C. E. Noble and associates will build a 10-ton concentrating mill at Rhodes station, to concentrate ore which runs 8 to 10% tungsten. Their mine is an extension of Silver Dike tungsten mine, being operated by Atkins, Kroll & Co., San Francisco. On this belt are about 15 veins in white quartz, which parallel each other. The metal occurs in diabase and quartz. There will be a haul of 6 miles from their mine to the proposed mill at Rhodes, where there is a salt marsh.

Mason.

McConnell mine, owned by O. H. Sonne of Reno, and S. B. Elbert of Denver, is being operated under direction of the former. The property adjoins the Bluestone and Western Nevada. It has a 400-ft. shaft and 5,000 lineal feet of tunnels and drifts. Copper carbonates and oxides have been mined to a depth of 200 ft., below which is mostly a sulphide. This is a deposit, rather than a vein, and has a width of 200 ft. in some places. The ore occurs in white crystalline lime and in garnetized lime, these bodies lying contiguous to a granite intrusion. Small shipments are being made of oxidized and secondary ores, which are mined from the surface by use of scrapers. It runs 8% copper.

Winnemucca.

The Gem group of 6 claims, on East range, 20 miles southwest of Winnemucca, is controlled by H. H. Sheldon and C. W. Kershaw, who have explored by making open cuts, trenches, pits, tunnels and shafts, on several veins of quartz and altered rock which cut through a formation of rhyolite and blue lime. They have also a contact vein between rhyolite and lime. The group includes the old Gem claim, where high-grade silver and gold ore was mined in early days. The ore occurs in chambers, shoots and lenses, the relative amounts of metals being about 1 oz. gold to 50 ozs. silver. The gold seems associated with chloride of silver and gray copper. The old workings showed the rich ore to be in the blue lime. They find ore running 400 ozs. silver and 15 ozs. gold, but a general average is placed at \$11 per ton. The equipment now on the property consists of hoist, air-compressor, blacksmith shop, ore cars and camp house. The plan is to develop to greater depth and if possible expose enough ore to justify building a mill.

Midas.

The Gold Circle district is gradually increasing its output with several new discoveries reported in the past few weeks. The Elko Prince, Rex and Coot mills are running at capacity and treating a good grade of ore. Eight bars of gold-silver bullion were shipped from the Elko Prince mill

in June, valued at over \$75,000. A crosscut is being driven from the main workings of the Elko Prince to the June Bell vein, which has been profitably worked by the Paul Ehlers lease for several months; 1000 tons of \$15 ore are ready for shipment to the mill.

Lessees have opened a fine body of ore in the Gold Circle Queen mine, located between the Eastern Star and Esmeralda properties. It was uncovered in the south drift from the I25 level and shows 8 ft. of ore assaying around \$16; 4 ft. is said to average around \$50 in places. Shipments are being made to the Coot mill.

Arrangements are being made for an early resumption of work at the Gold Crown, lying between the Elko Prince mine and Midas. Some good ore has been exposed and several lessees are endeavoring to secure blocks of ground. It is stated extensive work will be prosecuted on company account.

NEW MEXICO.

Mogollon.

Machine drills are now in use at the Pacific mine, operated by the Socorro Mining & Milling Co., and drifting is being pushed on the 500 level. All lumber for terminal station for aerial wire rope tramway at mill end is now on the ground, and the ore bins and headframe are nearing completion. Timber for construction at the Pacific end is being delivered. No definite date has been set for placing the tram in commission, but it is understood it will be in use in the early future.

Operations for last half of July on the Last Chance mine, conducted by Mogollon Mines Co., yielded 17 bars gold and silver bullion and 4.2 tons high-grade concentrates. Ore treated for the period was 2125 tons. The new shaft is now some distance below the 800 level and sinking continues at rate of 2 ft. per day. The counter-balanced, self-dumping skips recently installed in shaft have relieved the congested hoisting conditions.

No. 2 ore body in Eberle mine, on which developments are conducted by the Oaks Co., has been cut in a drift run south from main shaft and has all appearances of producing an extensive tonnage.

This district is credited with a total production of date of some \$15,000,000, and is yielding at the rate of about \$1,500,000 per annum in gold and silver. With the consummation of larger and more centralized operations now pending, in connection with decreased mining and reduction costs that will be effected by hydro-electric power installations and more direct shipping facilities, an unlimited tonnage of lower grade ores will become available and insure a greatly increased annual output for a long period of years. There is a total of 35 miles of vein outcropping in the district, but a comparatively small portion of which has been explored, and the development companies are steadily proving the value of new ground throughout the region.

Santa Rita.

The Silver Glance Mining & Development Co. has recently been incorporated with a capital of \$25,000, divided into shares of \$1 each. It owns and is developing a group of 10 claims including a millsite in Camp Fleming, 6 miles northwest of Silver City, containing silver and copper ores. The president and general manager of the company is N. P. Grenfell, Jr., Silver City, and the stockholders are mostly of the same place. The property has been developed by a shaft 70 ft. deep. It is located on a dike and cross spurs running each way from the dike. This main dike is 150 ft. wide, strongly mineralized, and has a northwest strike. The cross spurs on veins vary in width from 4 to 10 ft. and contain silver and copper. While the highest assays are 3434 ozs. silver and 26.6% copper, the average runs \$113, in silver and copper.

The Santa Rita Development Co. has been formed to develop 15 claims adjoining the Chino Copper Co.'s ground. Until the first stockholders' meeting to be held on Sept. 26, the following officers and directors will hold office: President, W. H. Lawhon; secretary, D. A. Richardson; treasurer and

assistant secretary, Edward C. Bradford, all of Douglas, Ariz. The above officers, with H. W. Loomis of Douglas, and Elmer S. Morton of San Francisco, constitute the board of directors. H. W. Loomis is general manager. The property is located only half a mile from the Santa Fe railroad and Loomis will commence work at once. After sufficient ore is developed a reorganization will be made and a mining company with a capitalization of not to exceed \$5,000,000 will be formed to absorb the stock of the development company. This was the method so successfully employed in the earlier stages of the Calumet & Arizona.

OREGON.

Grant Pass.

Haulage of ore is being pressed at the Queen of Bronze mine at Waters Creek station. They are now taking out about a carload a day at the rate of 1 ton per horse per day. There is one 6-mule team with 2 wagons, one 6-horse team with 2 wagons, three 4-horse teams and 2 wagons each and one 2-horse team in the ore-hauling outfit, which lands about 30 tons of copper ore at the station each day.

SOUTH DAKOTA.

Lead.

Universal effort is being made for a larger production at the Wasp No. 2, and it is said it is having some trouble in finding enough labor with which to carry on its increased activities. They are taking out, in the face of the working, from 500 to 600 lbs. of 60% tungsten daily and are understood to have on hand about 50 tons. They have made no shipment since the record single shipment was made some months ago, when a shipment of about \$100,000 was made. The cyanide plant treating low-grade, gold-bearing quartzite ore is now handling upwards of 250 tons daily, running at about half capacity. They are taking out ore that averages close to \$3, a material that would have paid a very satisfactory profit, when the mining was practically quarry work. Before going underground a \$2 ore would permit dividends, but now \$3 is showing but a small profit. It is estimated that the gold mill will pay the expenses of all operations, leaving whatever is received from the shipment of tungsten to become a net profit. The last gold clean-up amounted to a little over \$10,000. The tungsten on hand, if it can be sold at \$30 per unit, should bring about \$120,000.

Hill City.

Efforts are now being made to raise funds to install machinery which is on the ground at the Hill City Mining & Development Co.'s property. The steam hoist, not yet installed, has a capacity for sinking 1000 ft. Last fall it purchased a 20-stamp mill and saw mill, located a few miles from the mine, which can be hauled to the property and set up at no great cost. With these three items of equipment in operation, the company will be ready to proceed with the plans of development decided on. It is planned to sink to a depth of 500 ft. It is probable milling operations will be undertaken when a depth of 300 ft. is reached. The main shaft is now down 110 ft. on a gold-bearing ledge of ore, which has been traced for a distance of 6000 ft. The vein shows a width of 16½ ft. at the bottom of the shaft, where it has been crosscut and otherwise prospected. This is said to carry values of better than \$6, a large percentage of the gold being in the free state. The remainder of the ore is a suitable concentrating and cyaniding product.

UTAH.

Salt Lake.

Salt Lake Copper Co., whose mine is near Tecoma, Nev., has 12 sets of lessees at work and other leases have been let. They are mining a carbonate ore running 4 to 5% copper.

The ore is shipped and marketed by the company, which settles with the leasers. July shipments amounted to 23 cars. Average shipments run 12 to 15 cars per month. Geo. B. Church, Salt Lake, is manager for the company. The mine is in western Utah.

Bingham.

Silver Shield mine, under management of H. S. Joseph, Salt Lake, is shipping 100 tons per month of silver-lead ore, worth about \$20 per ton. A ventilating shaft is to be sunk 350 ft., the collar of which will be higher on the slope, above the tunnel level. This will make it practicable to mine bodies of ore in the stopes 350 ft. above the haulage level.

Colton.

Wasatch Ozokerite Co. has thoroughly opened stringers and lenses of ozokerite, or mineral wax, in shale, the bulk of material mined running about 2% ozokerite. A plant, having the capacity to handle 50 tons per day, has been erected and put in operation. The process is to crush the material, then concentrate by means of hot water vats and filtration. About \$100,000 has been expended on development and equipment. This material is a hydrocarbon, worth about 60 cts. per pound, and its uses are for insulating for lining acid tanks, and for making high-grade candles.

Milford.

Cedar-Talisman Con. Mining Co. has plans matured for building a dry concentrating mill for treating 100,000 tons of zinc, lead and silver ore contained in the accumulated mine dump. The grade of ore is estimated at 12% zinc, 10% lead and 7 ozs. silver. The plant will be equipped with a crusher, rolls and Stebbens dry concentrating tables. H. S. Joseph, Salt Lake, is manager. The property is 12 miles southwest of Milford.

Big Cottonwood.

Mines Development Co., Salt Lake, which has a lease on the Alta tunnel, has developed mixed sulphide and carbonate ore, some of which runs 55 to 60% lead and 30 ozs. silver. All work is above the tunnel level. This tunnel, which belongs to Alta Tunnel & Transportation Co., managed by F. V. Bodfish, is in 2100 ft., and crosscuts a number of veins between Silver Fork canyon and Alta.

Mercur.

West Mercur Mines Co., under management of C. A. Bennett, recently started its new cyanide plant of 150 tons' capacity, and is treating gold-bearing quartz, the vein being in limestone. The workings have reached a depth of 800 ft. on the dip of the vein. An Oliver filter was lately installed and an Ingersoll-Rand air compressor has been ordered.

Park City.

Mines Development Co., having a lease on the old workings of American Flag mine, is shipping 60 to 70 tons per month of ore that samples 90 ozs. silver, \$16 gold and 6 to 7 ozs. silver. Park City Mines Co., which owns the American Flag, is beginning development in new ground. After pumping out the water, now at 1100 level, the shaft will be sunk 200 ft. deeper. The American Flag vein, which dips to the east, and the Easter vein, which dips west, are 125 ft. apart at the 1000 level, and it is figured that they come together below the 1200. There are other veins between the Easter and the old Ontario vein, and development work is being carried on in that direction. A crosscut, driven from the 1100 level has cut the Ravenswood vein, which is 20 ft. wide.

Frisco.

Caldo Mining Co., which began last January, operating an oil flotation plant on the 200,000 tons of Horn Silver mill tailings, has been handling 150 tons per day, and is increasing the plant's capacity to 200 tons. It will be operating at this larger capacity in September. The product thus far has amounted to 20 tons per day of concentrates, running 40 to 45% zinc, and contains some silver and lead. Ed Lidvall is superintendent in charge. This dump of tailings has lain there for many years. A tube mill is used for emulsifying and to break up the cemented lumps. The pulp is then passed to six Callow rougher flotation cells, the concentrates therefrom passing to two Callow cleaner cells, and the tailings from the latter are concentrated on tables made by Deister Concentrator Co. The concentrates are then passed

through a Portland filter press to reduce the moisture. A filter press plant is being built to recover the water from the tailings as a means of securing the water for the mill. The tailings, as they come from the dump, are about 60 mesh. The tonnage still there is sufficient to keep the mill in operation 2½ years from this date. The company is controlled by J. M. Callow and associates, Salt Lake.

WASHINGTON.

Spokane.

It is probable that the action of the British government in blacklisting American firms under the "enemy trading" rule will affect the Standard Silver-Lead Mining Co., which owns and operates the Standard mine and mill at Silverton, B. C. Beer, Sondheimer & Co. are among the proscribed concerns, according to the recently published official list, and the Standard markets a considerable portion of its output through this concern. Beer, Sondheimer & Co. are metal brokers and agents for many smelters, including plants in Germany and Belgium. In connection with the operation of the latter plants they have long done a big business with British Columbia producers of metals, and especially zinc. They were for some years represented by J. L. Retallack of Kaslo, through whose agency they secured a considerable tonnage from various mines in the Slocan district. The only important contract they are now known to hold from British Columbia producers is for the purchase of 500 tons monthly of zinc concentrates from the Standard Silver-Lead Co. "We shall take the matter up at once with Beer, Sondheimer & Co. and the Canadian authorities," said Charles Hussey, secretary of the company. "As yet we do not know how the British order affects our contract. Whatever the laws of Canada provide we shall, of course, abide by. In the event that we are prohibited from shipping any more concentrates under our contract we shall be compelled to curtail our operations unless we are successful in opening up some ore bodies containing a good deal more lead and less zinc than those we are now mining. As a matter of fact we have been working our plant beyond its economical capacity to take advantage of the high metal prices, so that a curtailment of production was due soon anyhow, owing to the lower price of spelter of late, and the fact that we had been unable to secure a satisfactory contract for our zinc output in excess of that contracted to Beer, Sondheimer & Co. Presumably the Canadian or British Columbia governments will shortly take some steps to provide adequate reduction works in their own country for zinc ores, as otherwise the mining industry may be seriously affected."

Activity in the Chewelah district has been stimulated remarkably in the last few months by the high metal prices, and there is more development under way in that part of the region than ever before, according to L. K. Armstrong, general manager of the Security Copper Co. "At the United Copper mine all departments are operating at capacity, and the shipments have been increased considerably in the last month," says Armstrong. "Several teams, a 4-wheel-drive Jeffery truck and a tractor with five trailers are employed transporting the product to the shipping bins at Chewelah, 5 miles distant, and the consignments are going forward to the smelter at a rate never equalled before. The company now is installing a 30-ton tube mill, which will be in operation soon, the concrete foundations already having been placed, and it is believed that this will prove a valuable addition to the 74-stamp mill now in service.

WISCONSIN-ILLINOIS.

Linden.

An accumulation of low-grade ores here is aggravating the situation seriously. The prices submitted for the week offered no hope of improvement, and operators seemed willing to clear at any price. Milwaukee-Linden Development Co. shipped 7 cars to Cuba, 280 tons; Stoner, 1 car, 32 tons;

Ross Bros. Co., 1 car, 29 tons; Saxe-Pollard Co., 3 cars, 94 tons; all to Mineral Point. Linden Zinc Co. shipped 2 cars to La Salle, 61% zinc content, 80 tons. Optimo Nos. 1 and 2, to Linden Zinc Co., 7 cars, 293 tons. About 2000 tons of concentrates were carried over.

Highland.

Offerings of carbonate zinc ore showed decided slump in price, and only 3 cars cleared, one coming from the Waters-Fecht Co., 25 tons; 2 cars from the Dry-Hollow mines, 45 tons, all delivered to the Mineral Point Zinc Co.

Montfort.

The O. P. David mine shipped 1 car, 41 tons, of low-grade ore for separator treatment to National Separating Works, Cuba. Several cars of ore remained in bin. Operations were resumed underground, and much new ground is being opened up to good advantage.

Miffin.

Shipments for the week came from the Peacock mine, 2 cars, to American Metals Co., 77 tons; Lucky Six to La Salle, 43 tons; Biddick mine to Benton Roaster Co., 3 cars, 119 tons; Coker mines to Mineral Point, 6 cars, 237 tons. The Senator remains shut down, with about 300 tons of ore in bin, with no bids. The Vinegar Hill Co. is shifting operations from the Rundell to new deposits recently opened on extensions of the range, and is providing a complete new mining outfit. Much new ground is being opened up for both the Lucky Six and B. M. & B.

Mineral Point.

Receipts of raw ore at refining plants of Wisconsin zinc ore totaled 31 cars, 1169 tons. Shipments of finished product to smelter at DePue, 15 cars, 560 tons. Locals delivered 1 car to furnaces at Mineral Point, 38 tons. Mulhairn Mining Co., a new undertaking, is meeting with success in the Hazel Patch section, and is supplying a new mining outfit.

Platteville.

Deliveries of ore from mines to track last week were 121 cars of crude ore, 4832 tons. Very little ore came to the refining plants from independent operating companies. Three cars of lead ore cleared, one each coming from the Kittoe, Penn-Benton and Gray mines. Shipments of pyrites were light, 403,000 lbs. coming from the National Separators. About 6500 tons are held in reserve. Gross recovery crude ore for last week were 3867 tons; net deliveries to smelter, almost entirely high-grade refinery product, 2152 tons.

Local producers made a light turn-in for the week, the Hodge shipping 1 car to Cuba, 43 tons; West Hill, 1 car high-grade to La Salle, 42 tons; Klar-Piquette to Galena Refineries of the Wisconsin Zinc Co., 82 tons; East End to Galena, 2 cars, 85 tons.

Prices on zinc ore were, standard, 60%, and top grades going on a basis of \$57, with second and medium grades as low as 50% on a basis of \$50 per ton. It is more than likely that many low-grade producers will drop out of the producing list, as labor, powder and supplies are so high many contend better profits were being reaped on a much lower market than at present.

Cuba City.

National Separating Co. received 14 cars ore last week, 586 tons. The plant is well stocked. Shipments last week were made to Illinois Zinc Co., 5 cars, 183 tons; Granby Con., 1 cars, 154 tons; Utt-Thorne Co. to Benton Roasters, 3 cars, 125 tons.

Big strikes of ore in a new shaft going down for the Big Eight Mining Co. warrant new equipment and a plant will now be supplied.

Benton.

Vinegar Hill Zinc Co. has installed a Whaley type of electric shovel, in operation at the Martin mine, excavating two 1000-lb. cans of mill feed per minute. The machine cost \$8000, and General Manager Smith announces that more machines will be installed at the leading producers now operated for the Vinegar Hill Co.

Shipments of zinc ore for the week of Aug. 12 were light, only 39 cars reaching track, 3,314,000 lbs. Much ore was carried over. Burr mine, 2 cars, 92 tons, and Bull Moose mine, 5 cars, 231 tons, to Grasselli Chemical Co.; Fox and Penna-Benton mines, 9 cars to Mineral Point, 380 tons;

Fields Mining & Milling Co. to Galena Refinery Co., 7 cars, 260 tons; Vinegar Hill Co. to Cuba, 5 cars, 219 tons; Wisconsin Zinc Co., Skinner Refinery, to Grasselli Chemical Co., 2 cars, 87 tons; to Lanyon Zinc Co., 5 cars, 231 tons; Champion mine, surplus ore to Galena, 3 cars, 127 tons. Shipment of zinc ore was made from the Rowley mine, newly equipped, to Wisconsin Zinc Roasters at Galena, 30 tons.

Gillette Mining Co. is installing pumps and hoists. Acker Mining Co. is raising lead ore, after a shutdown due to repairs on milling plant. Hoffman Mining Co. is operating with new equipment. Frontier Mining Co. has struck a 22-ft. run of jack southeast of the Bull Moose Mine. Dr. Richard Kittoe struck a big jack with drill on his farm at Cuba at 80 ft., and again at 100 ft. The Maud, North Pole and Dickens mines are meeting with signal success in mining for lead ore on the Jas. Calvert farm.

The Galenaite Mining Co. has been organized here. The officers elected are Edw. Longhenry, president, F. H. Brainerd, secretary-treasurer. Ivan Coast has been appointed superintendent. The company has secured mining rights to the Buxton lease of 40 acres at Leadmine and adjoining the Drumm mine. Drills have been engaged to prospect the land.

Hazel Green.

Shippers for the week were the Kennedy, with 4 cars to Mineral Point, 164 tons; Cleveland to Galena, 40 tons; Lawrence to Galena, 3 cars, 121 tons.

Robert L. Hammil, general manager for the Monmouth Zinc Mining Co., reports a successful trial run of a new 200-ton power and milling plant, and the shipment of the first 2 cars of zinc ore to the Mineral Point Zinc Co. This mine and plant promoted by business men of Monmouth, Ill., and represents the outcome of nearly 1 year's diligent labor in developing a property. The ore is uniform in the range and runs up close to 10% ore in the mill rock. Drilling insures extensive production for 2 years or more. The equipment includes laboratory, assay office, miners' cottages, administration building, which is one of the finest in this section of the field.

Producers here going in good shape are now the Kennedy, Cleveland, Lawrence and Monmouth mines. The McMillan has not undertaken shipments to date, but is turning out ore successfully and has a wonderful deposit to run on.

Another new producer with equipment is in going shape for the McMillan Zinc Co., which transferred the big double equipment taken from the old Board of Trade mine. A. C. McMillan, general manager, has resigned in order to give his entire time to the management and development of the Rio mine adjoining the McMillan, and where drills have located one of the richest deposits of zinc ore yet discovered in the field. This work continues very successfully, but enough has been accomplished to warrant the erection of a new 150-ton power and concentrating plant.

Shullsburg.

The Winskill mine was the only one in the district to report last week, 6 cars going to roasters at Galena, 232 tons.

Potosi.

The Wilson mine delivered 1 car of high-grade blende last week to La Salle, 35 tons. The range now nearing development has been followed for years without success by various companies and now is opening up under the present management.

Galena.

The Black-Jack mine shipped 3 cars last week to Mineral Point, 125 tons; Galena Refining Co., to Illinois Zinc Co., 30 tons, and to Lanyon Zinc Co., 80 tons; Federal mine to refinery, 42 tons. Little Corporal, newly equipped and developed, shipped 36 tons. Wisconsin Zinc Co. to M. & H. Zinc Co., La Salle, 3 cars premium blende, 120 tons.

WYOMING.

Lander.

On Aug. 2 there were 5 wells considered in the field. The Hall Co. had four and the Valentine Co. one. Hall well

No. 1, the only one that is producing, has been estimated to run around 100 bbls. a day. The Valentine well looks like from 100 to 200 bbls. a day. The other Hall wells are going to be good pumpers. A number of dry holes and holes with only a limited amount of oil in them in the first sand has convinced operators that the lower sand, not yet drilled into, has the oil. A number of drills are now being started for the lower sand and in another 30 days ought to reach it in several places. The first tankage is about completed. Hall Co. twelve 250-bbl. steel tanks about ready for use. Another 2500-bbl. steel tank is being erected.

The Hall Co. is endeavoring to increase its production so as to warrant a tank pipe line installation. The Hudson Co. has commenced to pump another well and now has 9 wells on its list.

CANADA.

BRITISH COLUMBIA.

Slocan.

Development work at the Alice S. silver-lead mine is proving satisfactory. A new tunnel has been driven 250 ft. and will shortly open up a large body of high-grade ore, some of which assays over 2000 ozs. and 45% lead. Operations have been in progress since May 1, 1915. Work on the tunnel now being driven was started when a vein of about 20 ins. was encountered in the bottom of the old workings, which consist of 350 ft. tunneling. One car of ore has been shipped.

Three Forks.

The operating report of President A. F. McClaine of the Rambler-Cariboo shows the gross income to have been \$16,094. The disbursements totaled \$9360. Net earnings for the month were \$6734. In the two preceding months the net earnings approximated \$11,000 each. The cash surplus of the company Aug. 1 was \$16,797, as compared with \$10,064 on July 1. Shipments in July totaled 140 tons of lead concentrates and 30 tons of crude lead ore, as compared with shipments of 160 tons of lead concentrates in May and 160 tons of concentrates and 30 tons of crude ore in June. In May 70 tons of zinc concentrates were produced, as compared with 60 tons in June and 65 tons in July. These concentrates are not of high enough grade to be readily marketed, and it is intended to retreat them, with a large stock of similar concentrates previously accumulated, at the new electric separator being installed as a part of the concentrator being built at Kaslo. Operating expenses average a trifle under \$7000 monthly. The larger deduction than usual from gross earnings in July is due to the payment in that month of taxes and insurance and heavy purchases of supplies, especially mill accessories. The company pays dividends every second month. The next profit disbursement will be made Aug. 15 and will total \$17,500, at the rate of 1 ct. a share.

Sandon.

The pebble mill at the Slocan Star property was started on Aug. 7 and is treating 80 tons per day. About Sept. 15 the flotation plant will be started and the capacity of the mill will then be 160 tons. The new tramway from the mill to the railroad is working smoothly and the company is now shipping as fast as cars are furnished. Between July 28 and Aug. 7 it shipped 8 cars of 40 tons each. Of this amount 240 tons were lead and 80 tons zinc concentrates. The former averaged 70% and 90 ozs. silver and the latter 31% and 18 ozs. silver. Lead concentrates go to Trail and the zinc product to the Kusa Spelter Co., Dewar, Okla. The lead product at present is worth \$120 a ton net, or \$4800 a car. The zinc product will net \$15, or \$600 a car. The daily production of the mill at present is 7 tons of lead and 10 tons of zinc concentrates. With flotation in operation it will average 14 tons of lead and 30 tons of zinc concentrates. There is on hand now 150 tons of accumulated lead and 500 tons of zinc concentrates. Much of the zinc concentrates will require treatment by flotation before shipping. John B. White, director, says: "Now that we are producing again, and especially in view of the fact that our production will be doubled without increasing our operating ex-

penses, we figure that all indebtedness of the company, bonded and floating, will be cleaned up and a surplus accumulated by the end of October. The construction work is making progress, though we are being delayed to some extent by the failure to receive material for the new flume. Until the flume is completed we shall continue to be hampered for lack of air to run sufficient drills in the mine. All the working stopes and faces in the mine are looking well, and the manager reports particularly satisfactory improvement in the No. 3 and No. 8 levels."

ONTARIO.

Cobalt.

The Silver Queen Mine has been reopened and about 2 carloads of mill rock have been taken out and from 10 to 12 carloads remain to be hoisted. This will be shipped to the Northern customs concentrator as soon as arrangements can be made. The mill rock is being taken from the old stopes and as soon as the quantity in sight has been taken out cross-cutting will be resumed in exploring a strip of about 5 acres of ground which has not yet been prospected.

During July at Nipissing favorable results continued in development of vein 490 at the 500 level. About 470 ft. of drifting has been done on the vein and both faces still show ore of good width and value. The vein in the north face during the month, averaged 5 ins. assaying 1200 ozs. Towards the latter part of the month, the 5 ins. assayed 2200 ozs. The vein in the face has now turned considerably to the left and it is practically assured that it will continue on the Nipissing side of the boundary line. As drifting in the north face proceeds, it is becoming evident that vein 490 is the same as one of the branch veins on vein 98. This branch vein is still unstopped, the most important development being a raise which was started at the 4th level and shows 2 to 3 ins. of ore assaying 2500 ozs. to a height of 93 ft. above the level. If the two veins prove to be the same then considerable ore will be available for future stoping. Results from drifting to the south were not as favorable as those obtained in the north drift. The vein continued to aggregate 6 to 8 ins. in width but silver values were erratic, assays varying from 50 to 3200 ozs.

The People's Mining Co. is now down 50 ft. below the old 300 level. Some delay was occasioned on the start on account of water troubles, but a bulkhead was built on the 200, 25 ft. from the shaft. On the old 100 level a dam was built so that the workings now are comparatively dry. The shaft is now down 350 ft. and 200 ft. more will reach the desired contact.

Porcupine.

Development has resulted in new finds at the Newray mine. Thirty-six samples taken clear across the 25-ft. dike, including both vein matter and rock, gave an average of \$4 for the first 22 samples, while the next 14 gave 68 cts. up to \$38 in gold. At one part of the dike, a 26-ft. section, gave an average value of better than \$5, while another strip 16 ft. wide gave in sampling average assays of better than \$11. In all the sampling across the dike there were no blanks in the samples gathered, the lowest assay being 68 cts. Work is being carried on in the shaft with the object of locating the old vein lost in faulting and diamond drilling is under way. One drill hole is down 290 ft. The drill was pointed at a distance of 450 ft. from the shaft and at 42 degrees so as to cut the vein at a depth of 420 ft. Along the new vein shots are being put in at various points, and tests pits sunk.

South Lorrain.

Sinking is to be resumed at the Lorrain Con. The shaft is down 100 ft. and some drifting has been done on the 100 level on an 8-in. vein of calcite, well mineralized with smaltite and nickelite and carrying low silver values. The vein is well defined and strong, and consistent in width. The work now outlined calls for the sinking of the shaft to the contact, a distance estimated at 200 ft. or more below the present level, and from that point to carry on exploratory and development work. In order to carry on the work the compressor plant of the Frontier Mining Co. has been leased. The diabase is very hard. Manager Harkness estimates that he can sink 40 ft. per month. At that rate the contact should be reached by January, 1917.

World's Index of Current Literature

A Weekly Classified Index to Current Periodical and other Literature, Appearing the World Over Relative to Mining, Mining Engineering, Metallurgy and Related Industries, in Four Parts.

Part 1. *Geology*—(a) Geology; (b) Ore Genesis; (c) Mineralogy.

— *Six Months of Wonderful Prosperity for United States Mining*. [Reviews the first half of the year's production].—*Mg. World* Aug. 5 1916; p 229; pp 8¼*; 10c.

(C) OTHER NON-METALS

Arsenic

Browning, P. E.; Simpson, G. S.; Porter, L. E.—*On the Qualitative Separation and Detection of Tellurium and Arsenic, Iron and Thallium, and Zirconium and Titanium*. [Details of procedure for this chemical method are given].—*American Jnl. of Sci.* Aug. 1916; p 106; pp 3; 60c.

Ichikawa, Shimmatsu.—*Some Notes on Japanese Minerals*. [Treats on the peculiar nature of some mineral crystals found in Japan].—*American Jnl. of Sci.* Aug. 1916; p 111; pp 9*; 60c.

Reid, J. H.—*The Comet Mine, Sundown, Ballandean, Queensland, Australia*. [A geological description of the ore deposits and ore].—*Queen. Govt. Mg. Jnl.* June 15 1916; p 258; pp 2*; 35c.

Turner, W. A.—*The Separation of Vanadium from Phosphoric and Arsenic Acid and from Uranium*. [A description of a chemical method].—*American Jnl. of Sci.* Aug. 1916; p 109; pp 2; 60c.

Mica

Dunstan, B.—*Queensland Mineral Deposits*. [A review of occurrences, production, values and prospects of mica in Queensland, Australia].—*Queen. Govt. Mg. Jnl.* June 15 1916; p 263; pp 2; 35c.

Ichikawa, Shimmatsu.—*Some Notes on Japanese Minerals*. [Treats on the peculiar nature of some mineral crystals found in Japan].—*American Jnl. of Sci.* Aug. 1916; p 111; pp 9*; 60c.

Potash

Hicks, W. B.—*Simple Tests for Potash*.

—M. & S. P. Aug. 5 1916; p 207; pp 1½; 20c.

Phalen, W. C.; Hicks, W. B.—*Potash Salts in 1915*. [Chemical qualitative tests and methods of analysis are also given. The economic geology and occurrence of this mineral are reviewed, with an account of the progress made in developing the resource in this country].—Min. Res. of U. S. II:12; pp 39.

Salines

Way, Herbert, W. L.—*The Minerals of Sze-Chuan, China*. [Brief descriptions of the deposits, their possibilities and operation. Salts have been mined, petroleum is plentiful and gold, silver and copper give promise].—Mg. Mag. July 1916; p 20; pp 4*; 50c.

Mixer, W. G.—*The Thermochemistry of Silicic Acid and Heat of Combination of Silica with Water*. [Experiments of the author and comparison of them with others' results].—American Jnl. of Sci. Aug. 1916; p 125; pp 7½*; 60c.

Sulphur

Drushel, W. A.; Elston, C. M.—*On the Quantitative Estimation of Small Quantities of Sulphide Sulphur*. [The work is done with the inner tube of a Liebig condenser].—American Jnl. of Sci. Aug. 1916; p 155; pp 4; 60c.

Toso, Pietro.—*Sul Modo di Formazione dei Giacimenti Petroliferi e Solififeri*. [On the method of formation of petroliferous and sulphurous materials].—Ind. Chim. Min. & Met. June 10 1916; p 177; pp 5; June 25; pp 193; pp 3¾*; 70c.

—*Operations of Midwest Sulphur Co., Cody, Wyoming*.—S. L. Mg. Rev. July 30 1916; p 15; pp 2*; 25c.

III. TECHNOLOGY

MINES AND MINING

Prospecting

Brothers, Charles S.—*Mining and Prospecting in National Forests*. [Reviews the laws and rights of the miner and prospector in the National Forest reserves].—Mg. & Oil Bull. July 1916; p 185; pp 3*; 25c.

Herr, Irving.—*Sampling Placer-Gravel Deposits*. [Describes the system by which the holes were placed and method of plotting the same].—E. & M. J. Aug. 5 1916; p 261; pp ¾*; 25c.

Surveying and Drafting

Simmons, Theodore; Hanst, J. F.—*Dip and Strike Calculations*. [Graphical methods for determining].—E. & M. J. Aug. 5 1916; p 270; pp 1*; 25c.

Yaste, G. L.—*Care of Mine Maps*. [Notes the misuse of originals and states that it be eliminated by keeping tracings of them up to date].—Coal Age Aug. 5 1916; p 223; pp 1; 20c.

Pumps and Pumping

Gochnauer, H. W.—*Pumping Costs with Diesel Engines*.—Engg. Rec. April 1 1916; 20c.

Eddy, Lewis H.—*The Argonaut Mine, California*. [On the installation of a dam for storing tailings, power pumps and experimental work with flotation].—E. & M. J. Aug. 5 1916; p 265; pp 2¾*; 25c.

Gabelein, Paul W.—*Air Lifts at a Cyanide Plant*. [From the E. & M. J. describing this type of installation at the Baker Mines Co., Oregon].—Comp. Air Aug. 1916; p 8075; pp 1¼*; 20c.

Dredging

Smith, Howard D.—*Gold Saving on Dredges*. [Results are tabulated and drawings of jigs, etc., used in saving the gold from the dredged gravel are shown].—M. & S. P. Aug. 5 1916; p 202; pp 2¼*; 20c.

—*Gold Dredge at Hammonont, California*. [Reported as the largest ladder dredging bucket constructed].—Engg. Rec. June 24 1916; p 20c.

Mine Sampling

Herr, Irving.—*Sampling Placer-Gravel Deposits*. [Describes the system by which the holes were placed and method of plotting the same].—E. & M. J. Aug. 5 1916; p 261; pp ¾*; 25c.

Haulage and Conveying

Dewolfe, E. C.—*A Modern Coal Mining Organization in Illinois*. [From Electrical Mining. The equipment, operation and methods of managing at the Madison Coal Corporation's mines are reviewed].—C. Tr. Bull. Aug. 1 1916; p 43; pp 8*; 25c.

Geismer, H. S.—*Revolving Dumps at Coal Mines*. [On the use and description of various installations of this type].—Coal Age Aug. 5 1916; p 224; pp 1½*; 20c.

Trauttschold, Reginald.—*The Economics of Material Handling in Manufacturing Plants*. [Costs, details and curves of use in designing are given of standard practice in belt-conveying].—Engg. Mag. Aug. 1916; p 734; pp 13*; 35c.

Wilson, E. B.—*Slope Haulage in Alabama*. [Describes a slope haulage-way with varying grade over a mile long. It has handled the record coal output of the state].—Coal Age Aug. 5 1916; p 220; pp 2*; 20c.

—*Snake Creek Tunnel, Utah*. [A concrete tunnel. (The construction and methods used in driving it are described)].—M. & S. P. Aug. 5 1916; p 205; pp 2*; 20c.

Labor and Management

Balcomb, J. C.—*A Remarkable Tunnel Rapidly Driven in Brazil*. [Gives details of operation with drawings. A bonus system and unusual method of blasting are described].—Comp. Air July 1916; p 8040; pp 5*; 20c.

Dewolfe, E. C.—*A Modern Coal Mining Organization in Illinois*. [From Electrical Mining. The equipment, operation and methods of managing at the Madison Coal Corporation's mines are reviewed].—C. Tr. Bull. Aug. 1 1916; p 43; pp 8*; 25c.

Kellor, F. A.—*Making Americans of Foreign-Born Workmen*.—Mg. & Oil Bull. July 1916; p 181; pp 1¼*; 25c.

Production

Dunlop, J. P.; Butler, B. S.—*Silver, Copper, Lead and Zinc in the Central States in 1915*. [Separate reviews of the area, districts, states and companies].—Min. Res. of U. S. I:5; pp 93.

Hess, Frank L.—*Six Months' Tungsten Production*. [From a U. S. G. S. report].—Mg. World Aug. 5 1916; p 247; pp 2*; 10c.

Lewis, J. H.—*Zinc and Lead Districts of Wisconsin*. [On the mining and smelter operations and production during the first half of 1916].—Mg. World Aug. 5 1916; p 243; pp 4*; 10c.

Lyon, Burt W.—*Half-Year in the Joplin Lead-Zinc District, Missouri*. [Reviews prices, production and operations].—Mg. World Aug. 5 1916; p 239; pp 3*; 10c.

—*British Fertilizer Notes*.—American Fertilizer Aug. 5 1916; p 36; pp 3; 25c.

—*Coal Exports and Bunker Shipments in 1914 and 1915 in the United Kingdom*. [Parliamentary report showing the amount of coal shipped from each United Kingdom port to each foreign port].—I. & C. Tr. Rev. July 21 1916; p 74; pp 2; 35c.

—*Italy's Coal Trade During War Doubles with America*. [Reviews the situation, production, imports and exports].—C. Tr. Bull. Aug. 1 1916; p 40; pp 2½; 25c.

—*Six Months of Wonderful Prosperity for United States Mining*. [Reviews the first half of the year's production].—Mg. World Aug. 5 1916; p 229; pp 8¼*; 10c.

MILL AND MILLING

Sampling

Rose, Hugh.—*Santa Gertrudis Mill, Pachuca, Mexico*. [Abst. from A. I. M. E. Bull. All-sliming process is used and details of construction, operation and equipment are given].—E. & M. J. Aug. 5 1916; p 247; pp 6*; 25c.

Woodbridge, T. R.—*Ore Sampling Conditions in the West*. [Excerpt from an advance proof of the Bureau of Mines Tech. Paper 86].—Mg. World July 29 1916; p 183; pp 3*; 10c.

Crushing, Grinding, Etc.

Eddy, Lewis H.—*The Argonaut Mine, California*. [On the installation of a dam for storing tailings, power pumps and experimental work with flotation].—E. & M. J. Aug. 5 1916; p 265; pp 2¾*; 25c.

Rose, Hugh.—*Santa Gertrudis Mill, Pachuca, Mexico*. [Abst. from A. I. M. E. Bull. All-sliming process is used and details of construction, operation and equipment are given].—E. & M. J. Aug. 5 1916; p 247; pp 6*; 25c.

Scott, W. A.—*Commonwealth Mine and Mill, Pearce, Arizona*. [Gives details on operations and description of methods used].—Mg. World July 29 1916; p 187; pp 1½*; 10c.

Flotation

Eddy, Lewis H.—*The Argonaut Mine, California*. [On the installation of a dam for storing tailings, power pumps and experimental work with flotation].—E. & M. J. Aug. 5 1916; p 265; pp 2¾*; 25c.

Hughes, Ben.—*Concentrating Cobalt Silver Ores by the Oil Flotation Process*. [Brief description of plants using the system in the Cobalt district, Ontario].—Canadian Mg. Jnl. Aug. 1 1916; p 365; pp ¾; 35c.

Hyde, James M.—*An Improved Pneumatic Flotation Machine*. [Description of the machine, its application and operation].—M. & S. P. Aug. 5 1916; p 199; pp 3*; 20c.

Rose, Hugh.—*Metallurgical Experiments at Santa Gertrudis Mill, Pachuca, Mexico*. [Abst. from A. I. M. E. Bull. Flotation and electrolytic regeneration of cyanide are discussed].—E. & M. J. Aug. 5 1916; p 263; pp 2*; 25c.

Cyaniding

Carpenter, Jay A.—*Ore Treatment at the West End, Tonopah, Nevada*. [Gives some costs and discusses in detail the results of operations rather than the methods].—M. & S. P. Aug. 5 1916; p 197; pp 1½; 20c.

Gabelein, Paul W.—*Air Lifts at a Cyanide Plant*. [From the E. & M. J. de-

scribing this type of installation at the Baker Mines Co., Oregon.—Comp. Air Aug. 1916; p 8075; pp 1¼*; 20c.

Rose, Hugh.—*Metallurgical Experiments at Santa Gertrudis Mills, Pachuca, Mexico*. [Abstr. from A. I. M. E. Bull. Flotation and electrolytic regeneration of cyanide are discussed].—E. & M. J. Aug. 5 1916; p 263; pp 2*; 25c.

Rose, Hugh.—*Santa Gertrudis Mill, Pachuca, Mexico*. [Abstr. from A. I. M. E. Bull. All-sliming process is used and details of construction, operation and equipment are given].—E. & M. J. Aug. 5 1916; p 247; pp 6*; 25c.

CHEMISTRY AND ASSAYING

Chemistry

Browning, P. R.; Simpson, G. S.; Porter, L. E.—*On the Qualitative Separation and Detection of Tellurium and Arsenic, Iron and Thallium, and Zirconium and Titanium*. [Details of procedure for this chemical method are given].—American Jnl. of Sci. Aug. 1916; p 106; pp 3; 60c.

Drushel, W. A.; Elston, C. M.—*On the Quantitative Estimation of Small Quantities of Sulphide Sulphur*. [The work is done with the inner tube of a Liebig condenser].—American Jnl. of Sci. Aug. 1916; p 155; pp 4; 60c.

Hicks, W. B.—*Simple Tests for Potash*.—M. & S. P. Aug. 5 1916; p 207; pp 1½; 20c.

Mixter, W. G.—*The Thermochemistry of Silicon and Heat of Combination of Silica with Water*. [Experiments of the author and comparison of them with others' results].—American Jnl. of Sci. Aug. 1916; p 125; pp 7½*; 60c.

Pogue, Joseph E.—*The Chemistry of Minerals*. [Discusses the impurities of minerals and their effects on the mineral].—E. & M. J. Aug. 5 1916; p 434; 25c.

Sidener, C. F.; Pettijohn, Earl.—*Notes on the Determination of Aluminum*. [A discussion on the determination of aluminum as an oxide being precipitated with ammonium hydroxide].—Jnl. Ind. & Engg. Chem. Aug. 1916; p 714; pp 2; 60c.

Thornton, W. M., Jr.—*The Separation of Thorium from Iron with the Aid of the Ammonium Salt of Nitrosophenylhydroxylamine*.—American Jnl. of Sci. Aug. 1916; p 151; pp 4*; 60c.

Turner, W. A.—*The Separation of Vanadium from Phosphoric and Arsenic Acid and from Uranium*. [A description of a chemical method].—American Jnl. of Sci. Aug. 1916; p 109; pp 2; 60c.

Analysis

Browning, P. E.; Simpson, G. S.; Porter, L. E.—*On the Qualitative Separation and Detection of Tellurium and Arsenic, Iron and Thallium, and Zirconium and Titanium*. [Details of procedure for this chemical method are given].—American Jnl. of Sci. Aug. 1916; p 106; pp 3; 60c.

Drushel, W. A.; Elston, C. M.—*On the Quantitative Estimation of Small Quantities of Sulphide Sulphur*. [The work is done with the inner tube of a Liebig condenser].—American Jnl. of Sci. Aug. 1916; p 155; pp 4; 60c.

Kelley, G. L.; Conant, J. B.—*The Determination of Chromium and Vanadium in Steel by Electrometric Titration*.—Jnl. Ind. & Engg. Chem. Aug. 1916; p 719; pp 4¼; 60c.

Sidener, C. F.; Pettijohn, Earl.—*Notes on the Determination of Aluminum*. [A discussion on the determination of aluminum as an oxide being precipitated with ammonium hydroxide].—Jnl. Ind. & Engg. Chem. Aug. 1916; p 714; pp 2; 60c.

METALLURGY

Electrometallurgy

Rose, Hugh.—*Metallurgical Experiments at Santa Gertrudis Mill, Pachuca, Mexico*. [Abstr. from A. I. M. E. Bull. Flotation and electrolytic regeneration of cyanide are discussed].—E. & M. J. Aug. 5 1916; p 263; pp 2*; 25c.

—*The Peugeot Process of Zinc Electrolysis*. [A complete but concise description of the method is given].—S. L. Mg. Rev. July 30 1916; p 17; pp 2¾; 25c.

Thermic Metallurgy

Harbord, F. W.; Hall, J. W.—*The Metallurgy of Steel*. [A complete treatise on the subject].—Charles Griffin & Co., Strand, E. C.; book; \$10.

Mixter, W. G.—*The Thermochemistry of Silicon and Heat of Combination of Silica with Water*. [Experiments of the author and comparison of them with others' results].—American Jnl. of Sci. Aug. 1916; p 125; pp 7½*; 60c.

Stansbie, J. H.—*Elementary Practical Metallurgy for Technical Students and Others*. [The book is meant for use in connection with laboratory study. Mechanical testing of non-ferrous metals and alloys is treated on].—P. Blakiston's Sons & Co., Philadelphia; book; pp 151*; \$1.40.

Hydro-Metallurgy

Stannard, O. J.—*Chemical Methods of Extraction*. [Deals with the chemistry and brief description of thermic, electro and hydro metallurgical processes. A discussion of costs is also given].—Mg. Mag. July 1916; p 15; pp 5; 50c.

—*The Peugeot Process of Zinc Electrolysis*. [A complete but concise description of the method is given].—S. L. Mg. Rev. July 30 1916; p 17; pp 2¾; 25c.

POWER AND MACHINERY

Electricity

Dewolf, E. C.—*A Modern Coal Mining Organization in Illinois*. [From Electrical Mining. The equipment, operation and methods of managing at the Madison Coal Corporation's mines are reviewed].—C. Tr. Bull. Aug. 1 1916; p 43; pp 8*; 25c.

Luscomb, H. T.—*How to Select Prime Movers for Industrial Electrical Generating Plants*. [A discussion and detailed data on generating electricity from steam plants].—Engg. Mag. Aug. 1916; p 705; pp 11¼*; 35c.

Taylor, W. G.—*Motor Equipment for Petroleum Recovery*. [A paper read before the American Inst. of Elect. Eng. Deals with the use of induction motors in drilling, pumping, and cleaning oil wells].—Elect. Rev. & West. Elect. Aug. 5 1916; p 232; pp 5½*; 20c.

Compressed Air

Gabelein, Paul W.—*Air Lifts at a Cyanide Plant*. [From the E. & M. J. describing this type of installation at the Baker Mines Co., Oregon].—Comp. Air Aug. 1916; p 8075; pp 1¼*; 20c.

—*Snake Creek Tunnel, Utah*. [A concrete tunnel. The construction and methods used in driving it are described].—M. & S. P. Aug. 5 1916; p 205; pp 2*; 20c.

Steam and Steam Engines

Dewolf, E. C.—*A Modern Coal Mining Organization in Illinois*. [From Electrical Mining. The equipment, operation and methods of managing at the Madison Coal Corporation's mines are reviewed].—C. Tr. Bull. Aug. 1 1916; p 43; pp 8*; 25c.

Hubbard, Charles L.—*Making the Steam Plant Adequate for Both Power and Heating*. [Details on the operation of such a combination].—Engg. Mag. Aug. 1916; p 716; pp 7; 35c.

Luscomb, H. T.—*How to Select Prime Movers for Industrial Electrical Generating Plants*. [A discussion and detailed data on generating electricity from steam plants].—Engg. Mag. Aug. 1916; p 705; pp 11¼*; 35c.

IV. MISCELLANEOUS

Difference in domestic and foreign prices explained by the fact that the New York quotations are per fine ounce; the London per standard ounce 8.925 fine.

Copper.—Once more foreign buying of copper has furnished the initial impulse to the market, which is now steadily gaining in momentum. Already there is talk of the buying movement now underway exceeding in volume and, naturally, profits that of last April. First of all comes the impending purchase of the Entente Allies that will cover their requirements over 1917. This purchase is estimated to involve 150,000 tons of copper and may possibly run to 200,000 tons. The business will be apportioned among the leading producers. Second in importance are the orders for the red metal recently placed. The Russian government ordered 5000 tons for delivery in the last quarter and is seeking 5000 tons additional. An order for 1400 tons for Italian delivery has been closed, while it is understood that a French purchase also for the last quarter involves 5000 tons. Thus in the space of a week actual foreign sales amount to over 12,000 tons.

The combined Allied purchase is of greatest interest. One price has already been offered and rejected and the producers are now discussing new terms. The sale is expected to be announced within a week and will co-ordinate with the new English loan now under negotiation. Right on the heels of the foreign business, closed and pending, has come a revival in the domestic demand. Consumers on every hand are sending in their orders for last quarter delivery, and to some extent over the first quarter of next year. The situation strikingly bears out the confidence of copper producers that another period of activity would come in the fall. Of course the continuation of hostilities made this possible, but copper producers figured also on a tremendous peace in the event of the termination of hostilities this year.

As a result of the influx of business and the prospects for the loading up of order books over the greater part of next year prices have begun to move to higher levels. It is noteworthy that large producers are not discussing higher prices. The figures now being obtained are satisfactory, and to a large extent price increases in the present movement will be largely due to the workings of the law of supply and demand rather than control of the metal by producers. Electrolytic for delivery before October is scarce. Resellers withdrew their copper when it became evident that a new buying movement had set in. Spot and September electrolytic is difficult to obtain at 27½ cts. A week ago over 10,000,000

lbs. electrolytic were in brokers' hands for resale. Today these brokers are bare of spot copper. Producers have taken business for the last quarter at 26¾ cts. for October and 26¼ to 26½ cts. for November and December. Some orders for the first quarter were closed at 25½ cts., but at this writing sellers are demanding 26 cts. Study of the situation indicates that 30 cts. for last quarter copper may be paid. Domestic users neglected to cover needs on hopes of a reaction, and with a heavy foreign absorption of nearby metal on new orders the competition that home users must face can only result in advances in prices.

An interesting development is that new refining capacity is not coming into operation as fast as producers had figured. Thus one of the largest interests states that monthly output is nearer to 165,000,000 lbs. than to 180,000,000 lbs., whereas the reported output of 200,000,000 lbs. a month is considered inflated. A good deal of the new refining capacity will not be available until late in the first quarter, and therefore the outlook for enlarged supplies of copper is lessened.

At London the market has been very strong in standard, while latterly electrolytic has begun to show animation. Last week standard went up £5 10s in spot and £6 10s in futures, while at the opening of the current week spot advanced £4 10s further and futures £3 10s. Electrolytic opened this week £1 higher at £125 and on Tuesday advanced £1 additional.

Tin.—Efforts of users to take advantage of the low prices on tin to cover requirements over the last 3 months of the year failed of success, owing to the bull control of the London and Singapore market, combined with the insistence of spot holders to wait for higher prices on their holdings, on which they paid prices higher than those now prevailing. A fair amount of business has been done since our last report, but each succeeding day also brought higher prices. Users in their endeavors to conduct buying operations without stimulating the market found sellers wary and the influx of business quickly brought higher quotations. The situation is one where consumers have postponed covering operations just a little too long. London sellers have accumulated supplies, this being evidenced by the end of the bear campaign abroad, and are now ready for American orders. That they expect higher prices is indicated by the limits received here, which were often ½ to ¾ ct. above the market.

Consumers, however, took up the bulk of the foreign offerings. Spot straits is now held at 39½ cts., against 38c a week ago, while spot Banka, which sold down to 36½ cts., is now firm at 37 cts. A few sales of off-grade Chinese tin were made at 35½ cts., but now the market is firmer and higher. Tin for delivery in the last quarter is inclined to be scarce. Shipments from the straits in June and July were not very large, and on this basis London operators are forcing prices higher. Straits for October delivery is held at 38¾ to 39 cts., with November and December quoted at 38¾ to 38½ cts.

Foreign markets displayed a slight upward trend last week and opened this week with a sharp advance which carried tin at Singapore up £4 to £176. London straits tin went up £2 10s to £174. Standard tin has also moved to higher levels.

Quotations for tin per pound at New York and per ton at London and Singapore during the week ended Aug. 16 were as follows:

Lead.—After having remained dormant for several months, the lead market has suddenly come back to life with a heavy demand for spot and futures. For the first time in a year or more independents are asking and securing more than the price quoted by the principal producer. This presages an early advance by the A. S. & R. Co., although a week ago the outlook was for a reduction. Late last week new business came into the market, and thus far orders for about

2500 tons have been placed. Some of this lead is for export, but the bulk is being taken by domestic users. The placing of new shell contracts accounts for the renewed demand for lead. While the A. S. & R. Co. is quoting 6.00 cts. New York on open price contracts, independents have declined to take orders under 5.85 cts. St. Louis, which, plus a freight rate of 17½ cts., brings the price up to 6.025 cts. New York. Sales of 350 tons were made at Chicago at 5.90 cts. delivered, while before the buying movement gained full headway business was done at 5.80 cts. St. Louis and 5.95 cts. New York.

It is understood that the export business is for a European and not Asiatic consumer. Whether the newly found strength in lead will last is problematical. Producers are hoping for the best and, from the urgent desire of some consumers to cover for the last quarter, it appears that the market is entering a period of sustained activity. Producers did not accept many of the offers to buy futures, while dealers who formerly were willing to sell short have since withdrawn their offers. At London the lead market has displayed a steady upward trend. Last week spot advanced 10s and futures 7s 6d, opening the current week 5s higher in spot and 2s 6d in futures.

Quotations for lead per pound at New York and per ton at London for the week ended Aug. 16 were as follows:

Lead Ore.—In the Missouri-Kansas-Oklahoma district the prices remained at \$65 and \$67, as during the previous week, though during the week ended Aug. 12 the ores were in better demand and little weakness was noted. There were produced in the district during the week 1,245,630 lbs. of concentrates, bringing the total production for the year to date at 65,616,172 lbs., and these amounts were valued at \$10,429 and \$2,832,628.

Zinc Ore.—Prices in the Missouri-Kansas-Oklahoma district were again down \$5 and \$65 was paid for the better grades, the price ranging down to \$45 for those not so much in demand. Production during the week ended Aug. 12 was placed at 6,435,810 lbs. and the total for the year was brought up to 416,715,161 lbs. The value of the week's production was \$179,188 and the year's \$19,042,611.

Calamine.—Though prices during the week for this ore were identical with those of the previous week at \$35 and \$15, the condition of the market was noted as being weaker. The week's production was 51,200 lbs., valued at \$1000, and the

year's production to date was 19,454,720 lbs., valued at \$713,665.

MONTHLY AVERAGE PRICES OF JOPLIN ZINC ORE.

Month.	1916			1915.

Spelter.—A heavy foreign demand for spelter has developed since our last report. Business to an aggregate of 7000 tons has been closed. Producers took these orders gladly. The market is now free from surplus holdings. Conditions are shaping for a general advance. Domestic consumers have heeded the influx of business and are sounding the market, but producers are not willing to sell beyond September. With metal prices rising, ore costs will also go up. Thus producers are cautious. Spot has advanced moderately, now being held at 8½ cts. New York and 8½ cts. St. Louis. The improvement in copper is taken as a sign of betterment in spelter and therefore smelters are disposed to wait for higher prices. At London the market has advanced, spot last week gaining £5 and futures £3. Orders from the other side have been large, and with home consumers evincing renewed interest sellers are once more optimistic.

Quotations for spelter per pound at New York and per ton at London for the week ended Aug. 16 were as follows:

MISCELLANEOUS METALS.

Quicksilver.—Business has been limited and sellers have lowered prices to the extent of \$1.00 a flask. Powder makers are apparently well supplied and current orders are coming in from regular consumers only. Thus with increased stocks the market is inclined to be easy, with sellers offering at \$74 per flask.

Antimony.—Weakness continues apparent in this metal, with Asiatic interests offering at concessions. Spot has been sold as low as 9.50 cts., but the general asking price of handlers is 10¼ cts., while for November and December arrivals 9 cts., duty paid, is quoted. Demand has been very small and selling interests here have accumulated considerable supplies, which were shipped on prospects of being sold en route.

Aluminum.—New business has been limited, with the market holding fairly steady at 57 to 59 cts. per lb. for No. 1 virgin ingots in ton lots. Automobile makers have not been

in the market to any great extent. In fact, some of the makers of cheap cars have eliminated the use of aluminum on the 1917 models. Other consumers are well covered for their immediate needs and are not disposed to take on additional supplies at current prices.

Nickel.—There has been no change in the situation. Demand is of fair proportions, with prices repeated, namely, 45 to 50 cts. for ordinary forms and 5 cts. additional for electrolytic.

Muriate, lump.....	.17	to	.18
Arsenic—White, lb.....	.06¼	to	.06½
Red, lb.....	.55	to	.60
Barium Chloride—Ton.....	110.00	to	115.00
Nitrate, kegs, lb.....	.14	to	.15
Bismuth—Metallic, lb.....	3.15	to	3.25
Subnitrate.....	3.10	to	3.15
Bleaching Powder—			
Drums, 100 lbs.....	4.00	to	5.65
Borax—100 lbs., car lots.....	7.75	to	8.00
Coke—Connellsville furnace.....	2.50	to	2.75
Foundry.....	3.00	to	3.50
Copperas—Spot, lb.....	1.50	to	2.00
Ferromanganese—Spot.....	175.00	to
Last half.....	175.00	to
Ferrosilicon, 50%.....			85.00
Ferrotitanium, per lb.....	.08	to	.12½
Fuller's Earth, 100 lbs.....	.80	to	1.05
Glaubers Salts, bags.....	.50	to	.75
Calcined.....			2.50
Iron Ore—			
Bessemer, old range, ton.....			4.45
Bessemer, Mesabi.....			4.20
Non-Bessemer, old range.....			3.70
Non-Bessemer, Mesabi.....			3.55
White crystals.....	.15%	to	.15%
Broken, cakes.....	.14%	to	.15
Powdered.....	.17	to	.17½
Lead—Granulated, lb.....	.17	to	.17½
Brown sugar.....	.13%	to	.14
Litharge, American, lb.....	.09	to	.09½
Mineral Lubricants—			
Black summer.....	.13½	to	.14
29 gr., 15 c. t.....	.14	to	.15
Cylinder, light, filtered, gal.....	.21	to	.26
Neutral, filtered, lemon, 29 gr.....	.37½	to	.38
Wool grade, 30 gr.....	.29½	to	.30
Paraffin—High viscosity.....	.29½	to	.30
Naphtha (New York)—			
Gasoline, auto.....	.31¾	to	.32¾
Benzine, 59 to 62°, gal.....	.28	to	.28½
Nickel Salt, double.....	.07½	to	.08½
Single.....	.10½	to	.11
Petroleum—			
Crude (jobbing), gal.....	.15	to	.18
Refined, bbl.....			.12
Platinum—Oz. ref.....	80.00	to	84.00
Potash Fertilizer Salts—			
Kainit, min. 16% actual potash.....			32.00
Muriate, 80 to 85%, basis 80%, ton.....	450.00	to	475.00
High grade sulphate, 90 to 95%, basis of 90%.....	400.00	to	450.00
Hard salt, man., 12.4% actual potash.....	Nominal		82.00
Potassium—			
Bichromate.....	.38	to	.40
Carbonate, cal. 96 to 98%.....	1.30	to	1.35
Cyanide, bulk, per 100%.....	.75	to	1.00
Chlorate.....	.45	to	.50
Prussiate, yellow.....	.75	to	.90
Prussiate, red.....	2.40	to	2.50
Salt-peter—Crude, lb.....	.12	to	.14
Refined.....	.25½	to	.26
Soda—Ash, 58% (43% basis), bbl.....	1.25	to	1.50
Strontia Nitrate, casks, lb.....	.47	to	.48
Sulphur—			
Crude, ton.....	28.00	to	29.00
Flowers, 100 lbs.....	2.50	to	2.70
Roll, 100 lbs.....	1.95	to	2.25
Tin—Bichloride, 50°, 100 lbs.....	.13½	to	.14
Crystals, bbls., lb.....	.29½	to	.30
Oxide, lb.....	.44	to	.46
Zinc Chloride.....	.10½	to	.11½

TAILINGS ON SILVER CREEK, NEAR PARK CITY, NEAR WORKS OF BIG FOUR EXPLORATION CO.

Concentrating Mill Tailings Near Park City, Utah

W. A. SCOTT.

The Big Four Exploration Co., controlled by Kirk & Leavell, Salt Lake City, and associates, is operating a concentrating mill of 750-tons daily capacity, on Silver Creek, 7 miles northeast of Park City, Utah. The material being treated consists of mill tailings deposited there during the early 25-year period of Park City milling operations. They are composed of zinc tailings, with their accompanying lead and silver contents, which ran down the canyons from the Ontario, Daly-West, Daly-Judge, Silver King and other mills, during those early days, when zinc was penalized at the smelters, and, therefore, was deemed an undesirable metal. Operators were willing to lose a fair amount of lead and silver to get rid of the zinc. In the locality where the Big Four is operating, Silver creek bed expands to a width of 200 to 1200 ft., and at the lower end of this wide area the creek enters a narrow canyon. As these tailings were carried down stream during a quarter of a century, they gradually banked up in the lower end of the valley, until their deposition covered an area 3½ miles long, 600 to 800 ft. wide, having an average depth of 30 ins. Toward the lower end of the deposit the maximum depth is 6 to 8 ft. During the last 10 years zinc-laden tailings from those Park City mills have not been allowed to escape.

The accompanying illustrations afford a true conception of these operations. They give a view of the mill, steam shovel, locomotives and ore trains, and the great windrows of tailings banked up by 4-horse scrapers. There are 14 Fresno scrapers, of Western Wheeled Scraper Co. make, being used; also, six single team scrapers for channel work, as well as several plows to use where a sod has formed. The principal windrow of tailings, containing 40,000 to 50,000 tons, is 35 ft. wide at base, 10 ft. high and over 1 mile in length; and this will be extended half a mile farther up stream this season. The scrapers cut to a depth below the deposit, slightly into the original soil. The main windrow extends upstream, and rather to one side; and work is in progress building another, parallel to the first, on the opposite side. The material thus banked up contains but little waste—although originally it was all waste. While banked in windrows, the water drains out, and the material becomes fairly dry. A railroad track of light construction was built from the mill up stream along one side of the main windrow, over which the stuff is hauled to the mill in 4-yd., 6½-ton, side-dump cars, by two 14-ton Porter locomotives, each engine pulling five to six cars at a trip. The cars are loaded by a Bucyrus steam shovel, having a 1½-cu. yd. bucket. The material is

BIG FOUR EXPLORATION CO.'S 750-TON CONCENTRATING MILL.

packed to load well and the steam shovel work is rapid and uninterrupted. Close to 1000 tons per day are taken to the mill. The excess of 250 tons per day over the mill's capacity is by-passed on a branch track and dumped in the stock pile for the winter run, when that in windrows will be frozen.

During 1915 a mill of 200 tons capacity was operated several months; and last March the rebuilding of the plant was begun, for the capacity of 750 tons. The new mill was completed and set in operation Aug. 1, and seems to be performing up to the required efficiency. The loaded cars are drawn upon a trestle and dumped into three hoppers, and running across the bottom of each hopper is a pan conveyor, 30 ins. wide, 13 ft. long, by which the tailings are thrown upon a belt conveyor, 30 ins. wide, 58 ft. long, and by this they are delivered to the boot of a continuous bucket elevator, 60 ft. between centers, standing 15 to 20° from the vertical, having 12-gauge steel buckets, 18 ins. wide, 8 ins. deep, the line running at the rate of 340 ft. per minute. At the head of this elevator is a split discharge, dividing the material equally between two trommels. Each trommel is 12 ft. long, 4 ft. dia., and is made of punched steel plate, with 1-in. round holes. Inside is a 2½-in. pipe, about 11 ft. long, which rolls as the trommel revolves, thus keeping the holes from blinding. The trommel oversize, consisting of sod and other substances, passes out by a conveyor to the dump; the undersize is thrown upon a belt conveyor and discharged into a bin 112 ft. long, 12 ft. wide and 15 ft. deep. Thus far the process is without water.

In the top of the mill are two 10x10-ft. steel tanks, holding 9000 gals. of water for the mill processes that follow. The tailings are drawn out of bins by hydraulic feeders, and discharged into two elevators, with 14-in. staggered buckets, and they deliver the material to four trommels, two on each side of elevator. Each trommel is 12 ft. long, 4 ft. dia., divided into two sections of 8 mesh, and one section of 3 mesh. The 3-mesh oversize is waste; the undersize of plus

8 minus 3 mesh is passed to roughing jigs. The minus 8 mesh goes to two Esperanza classifiers for desliming; slimes from the last named go to Dorr thickeners, and the sand to four duplex Callow 16-mesh screens. The Callow oversize, plus 16 mesh, passes to Wilfley No. 9 double-decked tables; the undersize goes through a mechanical divider and is feed for 12 Wilfley double-deck tables. The four Hartz 3-compartment jigs, which handle the plus 8 minus 3 mesh material, make a middling product and a clean tailing; this middling concentrate is pulverized in a 5x4-ft. Allis-Chalmers ball granulator, for concentration. The table equipment consists of 16 double-deck, and 16 single-deck Wilfleys; and 16 Overstrom-Deister tables, made by Deister Concentrator Co. The middling products made on Wilfley tables are passed through trommels, thence to a 6-spigot Kirk & Leavell classifier, the first three spigots discharging upon Wilfley finishing tables, and the other three to Overstrom-Deister fine sand tables. The Dorr thickener pulp is retreated on 10 Deister slime tables; the overflow water is reused as a wash-water in the mill. The ultimate product is recovered on the lower floor by 10 finishing tables—six Wilfley and four Deister. These concentrates discharge from finishing tables into two shaking launders, running parallel to each other, and

BUCYRUS SHOVEL HANDLING TAILINGS.

extending the full length of the mill; one of these carries the zinc concentrate and the other the lead. The launders discharge their concentrates, accompanied by water, into two concrete-lined sumps. Two dewatering drags, acting as elevators, take up the zinc and lead-silver products from sumps and deliver them into separate shipping bins. These drags consist of rubber belts upon which strips of angle iron are fixed like buckets on an elevator. The belt lines run 8 ft. per minute, at an incline of 45°, and by the time the concentrates are discharged they are pretty thoroughly dewatered. The ratio of zinc and lead in the mill output is close to 3½ cars of zinc concentrate to 1 car of lead. All concentrates are sulphides, being rosin zinc and lead, the latter carrying most of the silver.

The mill heads vary from 3.7 to 4.2% zinc, 1.6 to 2.5% lead, and about 3 ozs. silver. The lead concentrate runs 20% iron, 25% lead and 15 to 25 ozs. silver; the zinc product contains 37½ to 44% zinc, together with some iron, silica and low values in silver.

The 10 to 15% of the tailings deposited here, which run about 150 mesh, contains at least one-third of the metals recoverable, hence the importance of an effective treatment for the fine material and slimes. The water supply for mill is drained from the stream into a reservoir and settled; the clear overflow is then drawn by a flume into a sump at the pump station, whence it is forced into tanks at top of the mill by a Gould 6-in. centrifugal pump, which handles 1000 gals. per minute against a 100-ft. head. This pump is operated by a 40-hp. motor. By the opening of winter the company expects to have 100,000 tons of material in its stock pile for the winter run, where the steam shovel will be used in loading.

L. R. Davis, manager of the works, states that the extraction being made is between 60 and 70%, and in order to raise materially the percentage of extraction it is announced that Janney flotation machines will be installed this fall, to treat middlings and slimes from the finishing tables. Probably a 6-cell plant will be required. Mr. Davis, who was in charge during the construction period, has the operations well in hand, and is pleased with the work of the entire plant. M. P. Cloonan, who was construction engineer when the plant was being built, is now general mill foreman. Ross Cartee and E. P. Hapgood were engaged in working up the designs for the plant.

All machinery is electrically operated, the transformer, switchboard and motors amounting to a big item. The area of land covered by the deposit is leased on a royalty basis; that occupied as mill site, however, is owned by the company. Strange & Maguire, Salt Lake, being interested in the company with Morris P. Kirk and John H. Leavell, engineers, have in charge the work of delivering the material to the mill.

The surface appearance of an ore vein is apt to be deceptive to the unpracticed eye, as weathering changes the character of the minerals.

The K. & K. Flotation Machine.

The Southwestern Engineering Co., Los Angeles, Cal., is putting in the market a new and novel flotation machine, which consists essentially of a long, hollow, cylindrical drum, mounted on a horizontal shaft. This drum is provided with a series of longitudinal air slots and a larger number of longitudinal riffles running the entire length of the drum. The drum is rotated rapidly inside of a close fitting casing and the whole enclosed in a suitable housing as shown in the accompanying illustration. A discharge lip placed

THE K. & K. FLOTATION MACHINE.

tangentially to the periphery of the drum provides for taking the pulp into the frothing box and a controllable intake passage at the bottom of the frothing box provides for returning the pulp to the aeration chamber for retreatment.

The machine is very simple, having automatic tailings discharge and level control. One man can take care of any number of machines.

It can be run in the ordinary flow sheets in flotation work, or else can be run as an independent unit adding the oil directly to the machine.

Filtered Gas in Carbide Lamp.

To present cool, clean gas, at uniform pressure, to the burner tip is the idea embodied in a type of carbide lamp invented by John B. Anton of Monongahela, Pa., for which he has been granted patent No. 1,187,481. The lamp has the usual water compartment from which the water is fed to the carbide compartment by means of a valve. As the gas is generated it passes from the generator through a filter of felt or other absorbent material into still another compartment which constitutes an expansion chamber. The filter takes out the major portion of the impurities, such as slaked carbide. In the accumulator the gas is allowed to expand, and there being a series of baffle plates at the entrance to this chamber, any remaining impurities are precipitated. In the expansion chamber, the gas is maintained at practically uniform pressure, and when fed to the burner, gives a clear, steady light.

Governing the Use of Explosives in Mines

E. M. WESTON.*

A great danger to the miner and a loss to the mining industry is the increased use of poor brands of fuse with a very unreliable burning speed. Managers and buyers often do not realize how easily and how often this causes loss, especially in development work, where six or seven or more holes or pairs of holes have to go off in rotation. With poor, cheap fuse the miner cannot be sure of their going in correct rotation unless he cuts them 4 or 6 ins. different in their lengths. This means that 2 ft. or 3 ft. of fuse have to be cut off the cut holes. This leaves the fuse dangerously short, or it necessitates the use of longer fuse all round, which then costs the same or more money as reliable fuse. One round or bench hung up owing to poor fuse, or a hole misfired due to the same cause (big differences in the length of fuse are sure to cause misfires owing to unburnt fuse lengths being cut off when the other holes explode) will easily waste far more money than any apparent saving made. I must emphasize the fact that the surest way to prevent misfires is to have the lengths of fuses arranged so that all are burnt down nearly to the detonator before the first one explodes. I was once on a mine where owing to a loss of life suspected to be due to fuse, and owing to the better results gained, more expensive fuse was in use, yet the first act of a new manager was to make an apparent saving by buying cheaper fuse. The miner should test the burning speed of different coils and packets of any fuse he is using himself. Another cause of numerous misfires is careless crimping of detonators on fuse. Great care must be used that the inner core of powder is not pinched too much, as otherwise misfires are sure to occur. I have known miners leave this work to their natives. It is always wise to tie the fuse and detonator to the primer.

Regarding the use of tamping with high explosives. The force of the explosion is developed so suddenly that the gases exert their full force on the side of the hole before coming out along the hole. Notwithstanding this, tamping is a great advantage, especially in development work. It keeps the charge, detonator and fuse in their place and prevents them being shaken out by other explosions. Water is not a good tamping. Cut holes especially should be well tamped, but care must be taken in tamping not to cut or injure the fuse. Beware of loading gelatine into a hole recently fired, as it often contains heat enough to explode the charge.

We have now to inquire what are the conditions that affect blasting a hole; that is, what makes a blast a poor one or a good one in breaking rock? There are quite a large number, and until we understand something of their meaning and effect we cannot do intelligent work. They are:

- (1) The effect of the size and number of the free faces of rock around the hole.
- (2) The tenacity or strength of the rock to resist breaking.
- (3) The structure of the rock.
- (4) The strength and nature of the explosive.
- (5) Whether the hole is properly tamped and the explosive properly detonated.
- (6) Whether the hole goes off by itself or at the same instant with several other holes.
- (7) Whether the rock to be broken has to be lifted or falls itself.
- (8) The size and the form of the chamber (hole) in the rock in which the explosive is placed.
- (9) The strength of the burden on the hole. This is represented by what we call the line of resistance to breaking, and it is always measured at right angles (square to) the nearest free face of the rock.

Taking them in order: (1) By a free face we mean a face to which the hole can break out. Suppose we

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 5.

Fig. 6.

have a face at the end of a drive and drill a hole into it. Now, obviously there is only one free face to which the hole can break, and a hole has to be put in a certain way to break any rock at all off such a face, and in any case it cannot be very efficient, that is, it cannot break a lot of rock for the length of the hole and the amount of explosive used. Take, now, a bench in a stope and a hole in the bench. There are now two free faces, one to the bench on which the hole is drilled and the other the face of the bench looking out to the stope. In such a position we can with the same length hole and the same charge break very much more rock than in the face of the drive.

Suppose, again, we have a big slab of hanging wall reef in the face which one bench has undercut, we have now three free faces, in front, on the side, and below, and one hole would break down very much more rock

*Author of "Practical Mining on the Rand."

than that in the stope. Now, it is plain what we mean when we say that the number of free faces affects the work of a hole. The size of the free face also affects it very much. If one had a face of a very large tunnel one hole put in slanting would break more off than one in the face of a small drive. In the same way we know that in a narrow stope we cannot put so large a burden on a hole as in a larger stope, other things being equal. Why this is so we will try and explain later on.

No. (2) Does not take much explanation. We know, of course, that the harder and tougher the rock the less burden we can put on the hole or the more explosive it needs. The rock breaks by shearing, not by bending first, as it is rigid.

No. (3) This means that the presence of slips, heads, faults and bedding planes as well defined foot and hanging walls affect a charge. If we know they are there we should know how much they can be made to help us in making the hole and its charge break the most rock.

No. (4) This we have already discussed and shown that some explosives are more powerful and more suited to different kinds of rock than others.

No. (5) This also we have discussed and shown the need of care and attention to get the best results.

No. (6) With the exception of the cut, this concerns rather the quarryman, who fires a lot of holes together by means of electricity: such holes help one another.

No. (7) This is usually not of much importance in mining.

No. (8) It is most important that we try to understand what this means, for, as will be shown later, neglect to realize what this means lies at the bottom of much bad work. We must remember that when the charge explodes the gas which fills the hole presses equally all over the inside surface of the hole with the same pressure of 117 tons to the square inch. If we had a ton of explosive and it only had one square inch to push the burden out with, it could only give a push of 117 tons. Suppose we have a hole 1 in. in diameter, as shown in Fig. 1, then the pressure acts as the arrows show to break out the burden. The force exerted then depends on the diameter of the hole. That is, if 10 ins. at the bottom of the hole are 1 in. in diameter, the area over which the explosive can give its kick is only 1 in. \times 10 in. = 10 sq. ins. Now, the hole is bigger further up, say, 1¼ in. and the next 10 ins. of the charge can give the same kick over 12½ sq. ins., that is, they can give a bigger kick to move the rock in front of them. Let us try and realize what this means in a machine hole 7½ ft. deep, drilled with 2¼-in. starter, 2-in. second, 1¾-in. diamond, and 1½-in. chisel. The hole will be something like this, supposing the starter drills 18 ins. and the rest of the jumpers 24 ins. each: Allowing for wear of the bits the first part of the hole will be from 2¼ in. to 2⅛ in. diameter, the second 2 in. to 1⅞ in., the third 1¾ in. to 1⅝ in., and the bottom 1½ in. to 1¼ in. Now, suppose we start to

load this hole with eight plugs of 1¼-in. dynamite about 7 ins. long. We will get about two into the last foot or 14 ins. of the hole, and the three will press up into, say, 18 ins. of the second part, and the other three into about 15 ins. of the third part. So that taking the pressures tending to break the hole, the last foot of the hole has an area of 1¼ \times 12 = 15 sq. ins., the next 12 ins. has about 1⅜ \times 12 = 16½ sq. ins., the next 12 ins. has 1½ \times 12 = 18 sq. ins., and the last 9 ins. 1⅝ \times 9 = 19⅜. This shows us that the force breaking out the last foot of the hole is 15 \times 117 tons, of the second 16½ \times 117, and of the third 18 \times 117. In other words, the explosive in the last foot or two of any hole cannot do nearly as much work in trying to break out ground as the bulk of the charge which lies further up the hole where it is bigger. The explosion is so sudden that if the rock is not moved from the bottom of the hole instantly it will never break. The explosive further up the hole cannot come and help the explosive further down, though it might perhaps split some burden of it if there were heads. Think what this means when so many holes are drilled. No wonder there are lots of sockets. In some cases it pays to enlarge the bottom of the hole by exploding small charges of gelatine in it before loading up; but under the condition of stoping on the Rand it very seldom pays to do this. However, when working in narrow stopes with two free faces, as on a bench, what are known as extended charges work best, as the rock has to be broken in long slices. If we could get a machine that would groove out the top and bottom of stoping holes so that there would be more area for the gases to kick against, we could use our explosive to better advantage.

No. (9) Is also most important and requires some explanation. The line of resistance is always the shortest distance from the hole square to the free face of the rock.

In the Fig. 2, AB is the line of resistance, not AC. Now, every miner knows that in ground without lines of weakness one cannot put as large a burden on a hole in a narrow stope of 3 ft. as in a wide one of 5 ft., and there must be some reason for this. If we have a hole, Fig. 3, A, in a stope 4 ft. wide, and that hole breaks out, it breaks the rock by shearing (just as a rivet or bolt is sheared through) not by bending or stretching, along two lines AB and AC, and AB and AC are always at 90° (square) with one another; so in a really solid rock AD, which is the line of resistance (the burden) could not be more than about 2 ft. If the hole were placed at A¹, then it would be what miners call "too bound in": because the force of the explosion could not move the rock between A¹B¹ and AB and A¹C¹ and AC. It would just compress it, because the rock could not move back anywhere. Remember, that we are talking of solid rock like granite, the presence of slips and heads in nearly all rock alters matters to a certain extent. It is plain, then, that if we drew another figure for a stope 6 ft. wide, 3 ft. would be the most burden we could put on. So we say

the effect of a hole depends on the burden given to it for a certain height of free face. It also has something to do with the length of hole, because if we make our hole too long in relation to the burden, unless we spread our charge along the hole, it will "bull ring," that is, the part of hole round the collar will not break. The books give this rule for the right length of hole, that the distance from the center of the charge to the mouth of the hole should be equal to the length of the burden.

There is another important law with regard to the use of explosives. It is this: The amount of explosive necessary to break a hole increases as the square of the burden on it. What it means is this, if in the face of a stope you have a hole with 1 ft. of burden which we will say can be broken with one cartridge, then if we increase the burden to 2 ft. the charge necessary will be $2 \times 2 = 4$ plugs, and if the burden is 3 ft. the charge will be $3 \times 3 = 9$ plugs. This we know holds pretty true in practice, and is one of the chief reasons why a skillful hammer-man can break more fathoms to a case of explosives than a machine stoper, because he is putting in more holes with a much smaller burden. Now, in breaking ground in very narrow stopes with small machines, if we try to put very big burdens on the holes they are "bound in" by the sides, and anyhow they will require explosive to be used expensively, so that obviously the cheapest way in both drilling and explosives when using piston drills, is to put in long holes with a moderate burden; but, unfortunately, few miners understand how to use long holes. If we could get a small machine that we could move about quickly, or if we could arrange a set up for it from which a number of effective holes could be drilled, rock could be broken very much more cheaply by drilling a number of short holes 4 ft. or 5 ft. deep, because we have to drill out five times the amount of rock to drill one 8-ft. hole as to drill one 4-ft. hole, owing to the larger size of bits we have to use, and the speed of drilling depends on the amount of rock broken; but such a drill is not available yet. Then, also, we would be able to break the ground with much less explosive, as each hole would carry a smaller burden, but would require a very much smaller charge in proportion.

A New Flotation Machine.

In ore concentrating apparatus of the type where the ore is concentrated by gaseous flotation of mineral particles in fluid, the impellor blades, which agitate the liquid, finely ground ore and frothing agent, operate in a horizontal plane. George B. Eberenz and James J. Brown, of Cripple Creek, Colo., have found by careful demonstration that blades so mounted do not bring the finely ground ore into thorough contact with the air and frothing agent. They have consequently sought to improve upon the construction of machines of this character by providing agitating blades which move in a vertical plane. At the same time they provide a spitzkasten so connected with the

agitating chamber, vessel or tank that the finely ground ore and liquid will be driven into the lower end of the spitzkasten and then sucked back into the agitating tank over the top of the agitating blades, whereby more air is beaten into and mixed with the mass in the agitating tank and the whole mass returned again and again to the spitzkasten, where the concentrates rise and pass off, until the separation of the concentrates from the gangue is complete.

As seen in the accompanying plan and sectional view, the impellor is disposed slightly below the opening (17) and its blades in their travel extend down to a point approximately opposite the opening (18). The impeller has several horizontal vanes carrying blades, and there are spaces between the blades. These spaced blades assure the greatest possible amount of agitation, emulsifying and beating of the air and oil into

A NEW FLOTATION MACHINE.

the mass and bringing the finely crushed ore into intimate contact with the air, water and frothing agent. The mass so intermingled and mixed is driven from the cell or chamber (10) into the spitzkasten through the opening (18) and in the spitzkasten the concentrates separate and come to the top in the form of froth. This froth passes off over the apron and is discharged into the launder, while the tailings or gangue in the spitzkasten returns to the cell (10) through the opening (17) and is subjected to further agitation so that the mineral particles which have not been subjected to the action of the oil and froth will then come in contact therewith and will be raised when they once more pass into the spitzkasten.

With this invention it is not necessary to pass the mass from one agitating chamber into the spitzkasten, then into a second agitating chamber and again into a spitzkasten, and so on, but one agitating chamber and one spitzkasten is all that is necessary for the complete separation of the concentrates from the gangue.

Concentration Methods for the Reduction of Quicksilver Ores.

Experimental work, looking to the feasibility and the scope of application of concentrating methods for the reduction of quicksilver ores, is being carried on by the Department of Mining of the University of California, under the direction of Walter W. Bradley, of the staff of the State Mining Bureau.

Sufficient data have been gained, so far, to make a preliminary statement of partial results, pending the issuance of the report in bulletin form later. This is done in the hope that it may assist those who are making inquiries along these lines, and also that it may elicit suggestions from those who are similarly experimenting at various mines.

Aside from the war-begotten flurry of high prices, quicksilver mining in California has become more and more a question of economically handling larger tonnages of lower-grade ores. Since Robert Scott evolved his fine-ore, tile furnace in 1871, there have been no improvements worthy of mention in the metallurgy of quicksilver until the present agitation for concentrating. A very surprising feature of the situation, particularly to one familiar with metallurgical practices in the reduction of gold, silver, copper, etc., is the absolute lack of any systematic sampling and assaying at the quicksilver mines. So far as we have observed there is not a quicksilver mine in California which possesses or utilizes an assay office, at least there was none up to within the last 6 months. The distillation assay with the "Whitten" apparatus is simple, quick and accurate. The old-timers have been complacently saying "the furnace gets it all," and that therefore they did not need to assay. It is doubtful if the Scott fine-ore furnaces in operation in California are averaging 75% extraction. In addition they are notorious for the quicksilver absorbed by the furnace and condenser walls; also soot is formed which has to be re-treated for contained mercury. The products of fuel combustion being mixed with the vaporized mercury, cause condensing troubles.

These experiments have shown that high extraction (above 90%) can be obtained by water concentration on tables, with friable ores in which the cinnabar is distinctly crystalline. Crushing by rolls produces a minimum of slimes. If, however, the pulp contains a cinnabar slime, either from "paint" ores, or by reason of having to crush fine to release the sulphide, the extraction by tables will be low. In such cases, though, it can be improved by classification and treating the different sizes on separate tables. The slimed cinnabar can be recovered by flotation. A high extraction has been obtained by flotation tests in finely ground (80-mesh), fresh ores, utilizing either pine-oil derivatives or eucalyptus oils. We say "fresh" ores, because, contrary to common conception, cinnabar on exposure does oxidize sufficiently to affect flotation re-

sults, as some tests have indicated. Good results were obtained by table concentration on an ore carrying natural quicksilver.

The concentrates being obtained, have yet to be roasted. Retorts are of limited capacity; and the concentrates, because of their high specific gravity, require stirring to prevent packing. A small furnace of the Scott type could be used, with a narrower shaft and narrow shelf-slit; such as in use at the New Idria mine for treating soot. Here again we have the fuel combustion products mixed with the quicksilver vapor and the attendant condensing difficulties. Some form of rotary roaster may be adapted, or a small-size unit of the McDougall or Wedge type of mechanically-rabbed furnace muffle-fired.

The ultimate decision between a straight furnace reduction or concentration and roasting of concentrates, will be a matter of comparative costs coupled with comparative extractions. The initial installation of a Scott fine-ore furnace unit is high (including condensers, etc., \$1000 per ton day capacity. We know of instances where the cost has been materially less than this figure, but they are the exception rather than the rule; the extraction is low (in the majority of cases probably less than 75%); cost of operation is low (50 cts. to 75 cts. per ton for large units, economically managed, though this does not include high cost repairs, interest or depreciation on the high initial installation capital). A concentrating plant of equal capacity will require less than one-tenth the initial capital expenditure, and a correspondingly lower depreciation charge; it will give 25% to 30% higher extraction; but the operating cost, on account of finer crushing, will be 30% to 50% higher. These points will have to be determined for each individual property.

An Automatic Tailings Sampler.

In taking samples of the contents of the launder, the personal equation of the workman commonly employed to do this must be reckoned with. A mechanical method of taking the samples, which would do the work uniformly, automatically and at predetermined intervals, would therefore be desirable as well as economical. An invention of this kind is to be credited to Charles L. Lawton of Hancock, Mich., and his patent (No. 1,188,794) has been recently granted. The sample launder which he employs need not be located lower than the upper level of the main launder, and a fluid pressure jet is employed to lift the samples from the main launder to the sample launder automatically. At the same time the jet moves back and forth across the main launder so that a representative sample is secured. The fluid is automatically cut off from the jet at the termination of each movement, which results in economy of operation. A seal is established over the intake to the jet, whereby the air is prevented from being drawn in, and other means are employed to regulate the frequency of the sample-taking operation.

Mining Possibilities in Colombia, S. A.—VI

MATT. W. ALDERSON.

We travel along a river in Colombia, the Riachon, for instance. The country rock on the sides is gneiss, the bed of the stream is angular broken rock of this character. Suddenly we come to a marked change. For half a mile or more there is gravel in the bed of the stream. The sides are of softer material. This part of the stream bed and hundreds of feet up the hill on one side has been mined for its gold. We go on up stream and we are in gneiss again. After sev-

follow our own observations and conclusions, seeking only and always the truth.

And first let us see if we can agree on definitions of a few words. What is a "cerro"? A cerro is a mass of fragmentary material, principally clay and sand with some gravel, containing a small amount of gold. What is a "hilo"? A hilo is a gravel deposit on edge, between two enclosing walls of country rock.

Now there are gravel deposits in stream beds in Colombia with hilos and cerros in hillsides close by. Generally it is easy to see that a part of the gravel deposit came from the milling down of these cerros and hilos. The connection between them is intimate. Where did they come from?

On the Viborita property, in Colombia, is a quartz vein called the Alaska. It carried good values and was mined down to as far as it could be drained by a tunnel from the valley level. It stands at an angle of perhaps 40°. Paralleling it on the south, and with perhaps 100 ft. of country rock between, is a hilo. To the west the mountain is cerro. Large parts of this cerro have been ground sluiced down by nature in the past untold centuries, and where this action was greatest a small gulch was formed up which in times of antiquity the natives worked the gravel and took out the gold. Of late years a part of the summit of the mountain was mined by the company at present owning the ground, with resulting clean-ups of several thousand dollars. Is there any connection between the quartz and placer deposits?

We know that quartz is formed on the surface of the earth. We know how it and the accompanying gold are leached from the igneous magma. We know

MR. ALDERSON AT LA VIBORITA MINE.

eral miles we come to another place where placer mining has been, and is still, remunerative.

Why these isolated spots? Why is there no pay gravel between? Can it be said that the angular pieces of gneiss in the bed of the stream would not furnish splendid riffles for holding gravel and gold?

The Pato and the Nechi properties each have their millions. They are on opposite sides of the river from each other. How does it happen that there is not other rich ground up the valley or down the valley, connected with one or both of these splendid properties?

If placer gold was deposited by stream action, how does it happen that in flowing across a valley it left the gold where the bedrock is 75 to 90 ft. below the surface, and a short distance down the valley where the depth is only 10 to 20 ft., and the bedrock forms the finest kind of a natural riffle there is no gold whatever?

If placer gold comes from the milling down of quartz ledges, why is it that only once in 100 times or more are we ever able to detect any kind of a connection? And if that were true of the gulch deposits, where do the cerros of Columbia and the hilos come from?

These are puzzling questions in the light of the theories handed down to us in the books. Let us

1 AND 2 APEX OF ALASKA VEIN; 3 HILO.

how they are brought to the surface of the earth and spread out over it. We know how, later, the leached material is ejected, and how parallel veins are formed with parallel layers of country rock between. We know how, with this process going on for long periods, an immense cavern is formed in the bowels of the

earth, and the superincumbent mass above eventually falls, setting the quartz deposit on edge.

The accompanying illustration shows a cross section of the ground at the Viborita, wherein lies the Alaska vein and the paralleling hilo. Can we doubt that the hilo takes the place of what in some other parts of the world would be a parallel quartz vein?

We have but to understand that the hilo at the time it was formed was a part of the surface of the earth, the same as were the quartz veins. Then it is easy to understand that a cerro is no more nor less than tailings from nature's leaching vat, ejected as we know fragmentary material to be from geysers.

QUARTZ VEIN AND HILO BEFORE BEING SET ON EDGE.

when they become so choked that the leaching process is not carried on easily.

Does it not become plain to us how much of the bedrock at the foot of the mountain at the Viborita, wherein lies the Alaska vein, and the hilo is from 60 to 90 ft. below the surface, when a short distance down the valley and some distance up the valley it is not one-fourth so deep? Is it hard to understand why the pay part of the mine is directly in front of this mountain?

The Viborita is a much smaller deposit than the Pato, yet the corresponding cerro is much greater. What caused the difference? We do not know. But it is easy to surmise a conclusion that is reasonable. The Viborita was not fed by so much water. The throat of the geyser was smaller and the ejections were thrown higher and landed at a greater distance from the source. The Pato was fed by a much greater quantity of water. Everything was on a larger scale, the leaching was more perfect, and ejections were greater, but not through so narrow an opening. The dissolved silica went down stream instead of being left near the orifice of the geyser to make a quartz vein or deposit of silicious gravel. The ejections were never thrown to great height, so the cerro is insignificant. There was more of a stream for ground-slucing the gravel, and we have a correspondingly richer concentrate.

What do these observations mean to a man who has the intelligence to put two and two together to make four? They mean that the source of placer

ground was not up hill but in the ground beneath, that the gravel was thrown out of an orifice, and later on washed back into it. They mean that as one rides along a valley which has been mined for its placer gold and notices a cerro or a hilo on the side that the bedrock in front of that cerro or that hilo must be deeper than the ordinary bedrock of the channel if washed down by stream action only, and he is ready to drill in such ground with almost positive certainty that the gravel deposit there, and the better part of the pay, were beyond the power of the early day miner to reach. How many such places there are in Colombia I cannot say. I know of several, in my limited observation. How rich they are cannot be told until they are tested. But some day they will be understood and they will be worked, each according to its peculiarities, etc., and the result will be the adding of many, many millions to the wealth of the world.

* * *

My stay in the tropics was somewhat longer than 6 months. I went prepared to face all manner of danger to my health from obnoxious insects, fever producing conditions, etc. I was continually surprised by not having to meet those contingencies. On the Isthmus of Panama and on the rivers of Colombia, the middle of the days were uncomfortably hot; the temperature being in the 90s in the shade, but I was actually annoyed by insects less than I would have been at home in the same period. I experienced no illness of any kind whatever, and there was never a day when I was not ready for such demands as might be made on me.

I know men who were not so fortunate. They were annoyed greatly by insects. I know men who took large quantities of quinine or other drugs as a preventive of fever, who had severe headaches and attacks of what they called malarial fever. I know men who would not even bathe their faces or wash their hands in the morning because they felt feverish.

CROSS-SECTION SHOWING ALASKA VEIN AND PARALLEL HILO.

I was never afraid of water in my interior, and I used a great deal of it on my exterior. I was careful to avoid things that would tend to make my system feverish. I was regular in my habits and ate my three meals a day. If anything was apparently going wrong with me I gave it attention immediately. On one trip

I was stung in perhaps 40 places by small black wasps, hardly larger than gnats or fleas. The stings were very painful and swelled to considerable size. My peon said I would be unable to travel the next day. I happened to have a tube of carbolized vaseline with me. I applied this freely and in an hour I was as comfortable as if nothing had happened.

I believe the stings of insects are more poisonous in the tropics than in the north. And I would advise travelers there to go with such aids as they have learned by experience will best neutralize the effects of such stings. The natives violate all the essential rules laid down for us by sanitariums and thrive. In their villages they have no sewers. The tropical sun is a great destroyer of germs, and if the people only leave their waste products out as far from the house as not to be under the eaves, nature will do the rest. Her sewerage system is perfect. A tropical shower is all that is needed to leave everything sweet and clean.

Most of my time was spent in the mountains at an elevation of nearly 5000 ft. The coldest morning during my stay the thermometer registered 60. In the middle of the day the temperature, not in the direct rays of the sun, was 68 to 72, never higher. The climate was as near perfect as can be imagined. The water was good, the people were good and the country is good. It is a country rich in all kinds of undeveloped possibilities, particularly in an agricultural way and as a section for placer mining.

Double-Chamber Acetylene Lamp.

The lamp here illustrated has two carbide chambers for the generation of gas, one being used at a time. While the carbide in one chamber is being used, the other chamber may be refilled or replenished; no necessity for extinguishing the light. Furthermore, the carbide chambers are provided with compartments into which the gas is delivered and burners communicate with these compartments, the burners being in such close proximity with relation to each other that the gas emanating from one burner may be ignited by the flame at the other burner, and vice versa.

The lamp has a cylindrical body closed at its ends by means of detachable screw threads caps. A partition divides the body into two carbide chambers or compartments. A foraminous plate (5) is located in each of the compartments at the upper part and filtering material such as felt or blotting paper is mounted upon the plates. The plates serve as the bottoms of gas chambers (7). Nipples (8) communicate with the chambers and are located one at each side of the partition. Burners (9) are provided at the outer ends of the nipples.

A water tank (10) is fixedly mounted upon the body midway between the ends and tubes, extend down into compartments in the main body. The upper portions of the tubes (11) open into the tank (10)

so that water may flow from the tank through the tubes into the body of the lamp.

In operation the caps are removed and carbide is placed at the opposite sides of the partition. The cap (16) is swung from over the opening and the tank (10) is filled with water. While this is being done, the heads (14) are brought to closed positions against the lower ends of the tubes. When it is desired to generate gas in the lamp, one or the other of the caps is turned whereby the rod connected with the cap is moved longitudinally and the head (14) is moved away

DOUBLE CHAMBER ACETYLENE LAMP.

from the lower end of the tube (11), through which the rod passes. Thus, the water may flow from the tank (10) down through the tube (11) into the carbide at one side of the partition. When the carbide in the compartment becomes exhausted or inefficient for the purpose of generating gas, the other cap (12) is turned whereby the water is permitted to enter the other carbide compartment.

Mica has physical properties which render it of value or indispensable in several industries, such as the manufacture of electrical machinery and apparatus, the glazing and decorative trade.

Zinc silicate can be assayed by the Lowe method or a modified form of this process, but the formation of gelatinous silica both retards the assay and renders the result unreliable.

Production of Primary Spelter First Half of 1916

C. E. SIEBENTHAL.*

Reports submitted by all zinc smelters operating during the first 6 months of 1916 show that the production of spelter from domestic ore in that period was 267,696 short tons and from foreign ore 48,756 short tons, a total production of 316,452 tons, compared with 272,987 tons for the last half of 1915 and 216,532 tons for the first half.

The output of spelter by Illinois smelters increased over 5,000 tons for the 6-month period, and that of Kansas over 8000 tons, but the gain in Oklahoma was the greatest of all—over 15,000 tons—a result of the completion of a part of the large contemplated increase in smelter capacity announced early in the year. The remaining spelter-producing states also made a large gain, principally in Pennsylvania, where the new smelter at Donora was put into complete operation. The output of primary electrolytic spelter, amounting to 1697 tons, is also included in the production of these states.

The stocks of spelter held at smelters on June 30, 1916, amounted to 23,817 tons, against 14,253 tons at the beginning of the year and 5884 tons at the middle of 1915. This shows a gain over stocks at the close of the year, part of which was doubtless due to the accumulation of working stocks at new smelters which started during the period.

From the foregoing figures and the records of the Bureau of Foreign and Domestic Commerce it is calculated that the apparent consumption for the period was 229,086 tons, which compares favorably with 203,588 tons for the last half of 1915 and 160,906 tons for the first half. This consumption was not altogether domestic, however, for it must include the zinc content of the exports of brass and brass articles, which, as will be seen from the table of exports by classes, were largely increased during the first half of the present year.

In addition to that produced from ore, 15,800 of spelter was distilled or recovered electrochemically from zinc ashes, skimmings, and drosses. Probably one-fourth of this output of secondary spelter, including the considerable quantity of electrolytic secondary spelter, was of high grade. No statistics were obtained of the spelter produced by remelting skimmings, drosses, etc., but it was probably not less than 12,000 tons. The total output of spelter from both ore and skimmings was therefore about 344,000 tons, or at the rate of 688,000 tons a year.

Imports and Exports.

The imports of spelter were 464 short tons, compared with 415 tons during the last half of 1915 and 489 tons during the first half. The exports of spelter

of domestic origin were 58,007 tons, against 54,235 tons in the last half of 1915 and 64,368 tons in the first half. The exports of spelter of foreign origin, including spelter exported from bonded warehouse, as well as articles manufactured from spelter of foreign origin and exported with benefit of drawback, were 20,197 tons, compared with 8016 tons in the last half of 1915 and 5959 tons in the first half.

The imports of zinc ore were 231,845 short tons, containing 93,907 tons of zinc, and valued at \$7,449,068, compared with 92,169 tons of ore, containing 33,672 tons of zinc, in the last half of 1915, and 66,683 tons of ore, containing 23,997 tons of zinc, in the first half. The exports of domestic zinc ore were 34 tons, compared with 154 tons in the last half of 1915 and 678 tons in the first half.

The source of the foreign zinc ore imported into the United States during the first half of 1916 is shown in the following table:

From—	Quantity (short tons).	Zinc content (short tons).	Value.
Canada	12,863	5,187	\$ 314,524
Mexico	79,663	25,471	3,254,004
Spain	38,239	16,006	1,051,315
Italy	7,525	3,283	213,275
Australia	83,775	38,133	2,225,790
Other countries ¹	9,780	5,827	390,160
	231,845	93,907	\$7,449,068

¹Including China and Japan.

Prices and Value.

The price of spelter at St. Louis started at 17.3 cts. a pound, but a sharp rise in the latter half of February carried it to 21 cts. The price broke sharply to 17.1 cts. a pound by the middle of March, but a partial recovery brought spelter to 19 cts. by the middle of April, after which a long decline continued until the midyear, the half years closing with spelter at 12.1 cts. The average price of a pound of spelter for the first 6 months of 1916 was 17 cts.

The price of spelter at London followed a parallel course to that at St. Louis, but averaged about 2½ cts. a pound higher. The opening price was £90 a long ton (19.48 cts. a pound). The rise in February carried spelter to £111 a long ton (24.02 cts. a pound) by March 1, after which came the decline that, except for the partial recovery in April, brought the price down to £61 a long ton (13.20 cts. a pound) at the midyear. The average for the half year was £90 8s 7d a long ton (19.6 cts. a pound).

The foregoing prices are for the ordinary commercial grades of spelter. High-grade spelter suitable for cartridge spinning has been in such great demand that it has commanded a good premium:

At the average price for immediate delivery at St. Louis the value of the spelter produced from domestic ores during the 6 months was \$91,016,640, and that

*Excerpts from semi-annual report of U. S. G. S.

of the spelter produced from foreign ores \$16,577,040, a total of \$107,593,680.

As most of the spelter sold during the 6 months was sold under contract for future delivery at considerably lower prices than those quoted for immediate delivery, it is certain that the foregoing values are in excess of the real sales values.

It does not seem likely that the grade of ore smelted in 1915 and 1916 was materially lower than in previous years. Practically all zinc sulphide ores are concentrated before being smelted. If the average grade of zinc concentrates was in fact lower it would, of course, lower the average capacity per retort. But zinc smelters, forced by the lack of smelting capacity in 1915, paid a premium for higher grade concentrates and refused to buy the lower grade. It is improbable that the grade of concentrates from Franklin Furnace or from the East Tennessee zinc mines during 1915-1916 was lower. The grade of the small output of Wisconsin carbonates in 1915 was 2½ points lower than in 1914, and that of the green sulphide concentrates was 1½ points higher, but sphalerite concentrates from Wisconsin are mostly re-treated by roasting and magnetic separation, and the average grade as delivered to the smelter is not definitely known, but was higher than in 1914, because a larger part of the ore was roasted and magnetically concentrated before being smelted. In the Joplin district as a whole the average grade of sphalerite concentrates was 0.6 of a point higher, and the grade of carbonates and silicates more than 0.9 of a point higher in 1915 than in 1914.

Zinc sulphide concentrates from the Butte & Superior mill assayed on the average half a point higher in 1915 than in 1914. The spread of flotation treatment during 1915 must have operated to raise the grade of zinc sulphide concentrates in other western states. In fact, so far as domestic zinc concentrates are concerned, the grade must have been raised instead of lowered in 1915. But large quantities of zinc concentrates from Australia have been received and treated in 1915-1916. If these were sufficiently lower than the average grade of domestic concentrates to overcome the increase in grade of domestic concentrates, then the average grade of all concentrates may have been lowered. Assuming 40% as the average zinc content of the carbonates, 58% as the zinc content of the Joplin sulphides, and 50% as the average zinc content of all other sulphides, we get an average zinc content of 49% for all zinc ores smelted. Ingalls estimates it at 50%. As the Australian concentrates have for several years averaged a little over 47%, and as probably the higher grade concentrates only were brought to the United States in 1915, it does not appear that the Australian imports have materially lowered the general grade of concentrates smelted.

Exports.

The following tables of exports, taken from the records of the Bureau of Foreign and Domestic Com-

merce, show the exports, both domestic and foreign, by classes and destination for the 6-months' period:

Destination—	January-June.	
	Domestic.	Foreign.
Canada	4,634	638
Great Britain	19,188	6,481
Netherlands	6
France	18,804	11,177
Italy	5,807	1,901
Germany
Russia	3,219
Japan	610
Other countries	5,739
	58,007	20,197

In the following table is given the exports of lead and zinc from the United States during the 6 months of 1916:

Domestic—	January-June, 1916.	
	Quantity (lbs.)	Value.
Zinc ore	67,200	\$ 1,792
Spelter and sheets	116,014,559	20,575,060
Zinc dross	56,025	3,080
Zinc manufactures	304,452
Brass, old, for remanufacturing	2,568,002	527,884
Brass, bars, plates and sheets	103,085,355	28,917,034
Brass, articles made from	98,110,795
Cartridges	24,718,907
Lead, pigs and bars	93,233,404	6,198,514
Lead manufactures	1,080,321
Foreign—		
Zinc ore, contents
Zinc, blocks, pigs and old	40,394,341	4,154,127
Zinc dust	157,671	29,357
Zinc manufactures	1,072
Brass, old, for remanufacturing
Lead ore contents
Bullion, contents
Lead, pigs and bars	9,487,481	419,065
Lead manufactures	516
Lead used in articles exported with benefit of drawback	9,489,870	3645,311
Zinc used in articles exported with benefit of drawback
		\$185,687,787

Represents the value of the metal used in making the articles exported with benefit of drawback.

Inflammability of Illinois Coal Dusts.

A bulletin recently issued by the U. S. Bureau of Mines on "The Inflammability of Illinois Coal Dusts," with J. K. Clement and L. A. Scholl, Jr., as authors, gives the results of a detailed study of the dusts of Illinois coal mines, conducted in co-operation with the Illinois State Geological Survey and the Department of Mining Engineering of the University of Illinois.

The purpose of the investigation was to obtain accurate information concerning the quantity and character of the dusts produced in the mines of the state in order that proper methods might be devised for preventing dust explosions.

It was found that the coals of Illinois when ground to a sufficient degree of fineness yield highly inflammable dusts which when suspended in air may give rise to violent explosions.

In the majority of the mines of the state the dusts adhering to the ribs were found inflammable. In about one-fourth of the mines the quantity of rib dusts present in the entries were found to be sufficient to form an explosive mixture with air.

As an element, vanadium is very widely distributed, it being contained in greater or less quantities in a number of pottery clays, in granite, iron and other ores at home and abroad.

ZINC SMELTING CAPACITY IN THE UNITED STATES, AUG. 1, 1916.

Comparisons Between Steam and Water Power

H. W. BUCK.

There is probably no branch of engineering quite so confused and misunderstood at present by the general public and even by technical men as that connected with the development of water-powers. The mental chaos existing has brought this important industry to a standstill, with great economic loss to this country.

The advocates of the steam turbine plant proclaim loudly that the evolution of the steam turbine has put the water-power permanently out of business. On the other hand, the ill-informed and over-zealous legislators and so-called conservationists preach that water-power plants hold such a monopoly of the power supply of the country that this economic grip must be broken by force. Between these two adverse influences the legitimate development of water-power is being crushed.

As in most engineering problems of a complex nature, there are so many variables involved that it is not easy to write equations to which any general solution can be given. Every instance has its individual points which must be carefully analyzed. It is true that steam turbine plants equipped with very large units in localities where cheap coal is available, together with abundant low temperature condensing water, are able to produce power at a cost lower in some instances than water-power can be generated and transmitted over a long line to the same point. It is not fair, however, to make the comparison in this way. The question of load factor is a controlling one, and must be thoroughly reckoned with before a correct conclusion can be reached. In each case the cost of the water-power should be figured at the power station busbars, and the steam power cost estimated on the same basis. Then the cost of transmission should be added to both steam and water-power costs to obtain the final comparison. The severe condenser water requirements for the modern steam plant often require its location to be at such a point that considerable transmission expense is necessary for it as well as for the water-power.

Another common error lies in comparing the theoretical cost of steam-power with the selling price of the water-power, which includes a profit. No steam central station is likely to sell power at cost. Furthermore, the "costs" frequently quoted for steam-power are switchboard costs only, and do not properly include fixed charges and other general items of expense.

Steam-Power Situation at Buffalo.

There has been much discussion of late, regarding the status of a large steam turbine station being constructed at present near Buffalo, N. Y., to be operated in conjunction with Niagara power. Loose and incor-

rect conclusions have been drawn from this fact as showing that steam-power has now surpassed Niagara power in economy. The situation at Buffalo is a special case. In the first place, Niagara power is limited by law in extent and cannot be supplied to meet further demands in the growth of the Buffalo load. The matter of load factor also enters as an essential factor.

Niagara power, like all water-powers operating on a definite constant stream flow without storage, must be sold on the basis of maximum demand at a yearly rate. Niagara power, as is well known, is sold at a price which includes a profit of from $2\frac{1}{2}$ mills to 3 mills per kilowatt-hour on the basis of 100% load factor use. The Buffalo system, like any other general power system without an electrochemical load, cannot utilize power at 100% load factor. If its load factor is, say, 60%, then the 3-mill rate on the 100% load factor basis becomes 5 mills at 60% load factor, and a cost is reached where the large steam turbine shows an advantage over water-power. Here again, however, the cost of steam-power is being compared to the selling price of water-power, which latter figure contains a profit. No steam-power station could afford to sell power on a 100% load factor basis in competition with water-power from Niagara Falls.

In spite of the active competition between steam and water-power, which is in many instances unquestionably in favor of the steam plant, there are still a number of situations where a water-power development can be legitimately and profitably made. Furthermore, many new water-power developments will be made if rational legislation is passed by Congress which will give to such enterprises the required security. Public opinion is apparently swinging around toward a more sensible point of view with respect to water-powers, and the recent action by the Conservation Congress in Washington, in which extreme hostile views in the matter were repudiated, confirms this belief.

Electrochemical Industry as a Factor in Water-Power Development.

The electrochemical use of water-power is becoming the greatest factor in the situation. The electrochemical business has been brought up on Niagara power and on the powers connected with the Great Lakes system, which are the only ones in this country that can deliver power at a constant rate throughout the year. There are, however, many large rivers in the country which can be developed at low cost for a power supply varying with the seasons, but with an enormous annual output in the aggregate at a cost per kilowatt-hour at least as low as from Niagara. It is to be hoped that the electrochemical industries can so

adjust the commercial operation of their processes for variations in production with the seasons that such water-powers will become available.

Where public utilities are to be served requiring a constant power supply throughout the year, the low-water season can be taken care of by combinations of steam and water-power, which in almost every case figure cheaper than either steam or water-power alone. The low capital cost of the modern steam turbine plant makes it financially possible to construct a steam plant as a part of a water-power system and shut it down for a considerable portion of the year without an excessive interest charge against the combined cost per kilowatt-hour.

An element inseparable from water-power development is the high-tension transmission line. During the past 20 years the limit of transmission has been extended at an average rate of about 10 miles per annum, and might now be placed at 200 miles. For the present the limit has undoubtedly been reached for the art as it stands today. Lines with respect to insulators, lightning and surge protection, etc., cannot be considered as satisfactory. This situation has caused hesitation in the use of hydroelectric power.

Reasons for Water-Power Development Stagnation.

In brief, then, the stagnation existing today in the development of water-power is due to several definite causes.

1. Congress refuses to pass the necessary legislation for the use of water-powers on public lands or on navigable streams.
2. The development of the steam turbine has under certain conditions resulted in power costs lower than the equivalent water-power, which has led to the false doctrine that all steam-power is now cheaper than water-power.
3. The evolution of the high-tension transmission line has been so rapid that the troubles which have quite naturally arisen, some of a serious nature, have tended to discredit transmitted power.

There is no proposition so economically sound and which deserves encouragement from all sources in this country as the development of water-power. All of the above difficulties can and will be overcome in due time. The country needs water-power development, and it is going to have it, but will not take it on oppressive terms. Engineers can clear up the steam-hydraulic controversy by proper analysis of the facts and by the elimination of boasting as to economies on either side. The difficulties with the transmission line will be met and overcome, as other difficulties in electrical engineering have been eliminated by experience and ingenuity.

We need to preserve all of the coal we have in the country for use in heating processes where it can be utilized at an efficiency of 85%. The use of coal for the production of power at an efficiency of 20% or less, which is now about the maximum, should be dis-

couraged, and this can only be done by the encouragement of water-power development.

Power Haulage in Death Valley.

The twenty-mule teams, with their picturesque drivers and long, snakelike 50-ft. cracker whips, that have made Death Valley and the mines of the Pacific Coast Borax Co. in California famous for more than a quarter of a century, and around which romance and tragedy has been weaved by the versatile publicity agent, are giving way to the more prosaic haulage system of modern times. Within the past year chugging gasoline industrial locomotives, with their trains of from 10 to 15 loaded cars, have wound their way up and around Black mountains and over Death Valley and the dry bed of Salt Lake, and the famous mule teams are passing into history. This change has been brought about by the cost data expert, who, with his charts and figures and the experiences of others behind him, decreed that, while the 20 mules were picturesque and afforded good material for literary essays, they proved too expensive in the production of borax. The gasoline industrial locomotive, he said, would not only cut down the haulage costs about one-half, but speed up the mines and cut down manufacturing and mining costs. His promise has proven true since the installation of the first two Plymouth gasoline locomotives more than a year ago, according to General Superintendent A. W. Sheean of the Pacific Coast Borax Co., and the change was more than warranted by the results received.

The full story of this interesting experience, as well as that of other mine owners in different fields, is contained in a 96-page book, "Cutting Haulage Costs in Half," copies of which can be secured by the Mining and Engineering World for any of its readers who may have a practical interest in the subject.

New Oklahoma Oil and Gas Possibilities.

Within the last few months numerous shallow gas sands have been encountered in several wells being drilled a few miles east and southeast of Billings, Okla. That these wells deserve a close watch by the oil and gas industry is the opinion of government geologists, because of the presence in this region of a large anticlinal fold, a type of rock structure which should be favorable for the accumulation of oil and gas. Should these wells discover any highly productive oil and gas sands, there is a good possibility for the opening of an oil and gas field of considerable extent near Billings. A description of the rock fold and a discussion of its possibilities are contained in Bulletin 641-E, recently issued by the Survey.

Rutile is the principal source of titanium, from which the latter is recovered in the electric furnace.

What the Mining Companies are Doing

Butte & Superior.

The quarterly report of the Butte & Superior Co. for the period ending June 30, shows net operating profits of \$2,062,029, compared with \$2,107,152 in the previous quarter. The last three quarters showed the following:

	June 30, 1916.	March 31, 1916.	Dec. 31, 1915.	Sept. 30, 1915.
Net value zinc concentrates.....	\$2,879,568	\$4,337,412	\$3,614,570	\$2,997,128
Net value lead concentrates.....	246,341	264,303	240,053	228,110
Miscellaneous income.....	22,772	21,427	18,265	14,715
Total	\$3,148,682	\$4,623,143	\$3,872,888	\$3,239,954
Operating costs.....	1,086,653	1,068,203	1,112,849	679,625
Net operating profits	\$2,062,029	\$3,554,940	\$2,760,039	\$2,560,329

The company now has 290,197 shares outstanding, 17,500 having recently been issued for 35,000 shares of American Zinc, Lead & Smelting Co. common.

President MacKelvie says: Active development work was commenced on 1700 and 1800-ft. levels and while work is not great as yet, the size, character and grade of the ore bodies disclosed are fully as favorable as those of the levels above. Most of the work on these lower levels was confined to drifting, but even with the limited amount of cross cutting that was done the addition to ore reserves was substantial, and taken together with the additional reserves blocked out on the 1600-ft. level and above, constitute a total addition to reserves for the quarter about 30 per cent in excess of the tonnage mined for the quarter.

After the payment of the regular quarterly dividend of 75 cts. per share and an extra dividend of \$10 per share payable to stockholders on June 30, the company had net quick assets of approximately \$3,000,000.

Sales of spelter have been made for future delivery covering a substantial portion of our production for the balance of this year. These sales have been made at a lower price than that applying to the second quarter.

Average price of spelter used in determining profits for quarter is 11.41 cts. per pound.

Utah Copper Co.

Net profits totaling \$9,895,316 were realized by the Utah Copper Co. during the quarter ended June 30, 1916. In the corresponding quarter a year ago net profits were \$1,412,298, cost 6.57 cts. per pound. Production was 48,384,929 lbs. copper, compared with 36,561,533 in previous quarter. After making allowances for smelter deductions and crediting miscellaneous income, including Bingham & Garfield railway earnings, average cost per pound was 6.726 cts., compared with 7.19 cts. for previous quarter.

The income account compares as follows:

	June 30, 1916.	March 31, 1916.	Dec. 31, 1915.	Sept. 30, 1915.
Net profit from operations.....	\$8,675,432	\$6,186,414	\$5,771,281	\$3,663,708
Other income.....	122,509	68,165	249,273	25,668
Nevada Cons. dividend.....	759,375	509,250	509,250	375,188
Bingham & Garfield Rv. dividend.....	400,000	325,000	407,397	350,000
Total net profit	\$9,958,316	\$7,079,830	\$6,919,203	\$4,414,564
Dividends.....	4,873,470	4,061,225	2,436,735	1,624,490
Surplus	\$5,084,846	\$3,018,605	\$4,482,468	\$2,790,074

Earnings are computed on basis of 26.758 cts. per pound for copper, compared with 26.131 cts. per pound for previous quarter.

Copper production for the past five quarters follows:

	June 30, 1916.	March 31, 1916.	Dec. 31, 1915.	Sept. 30, 1915.	June 30, 1915.
First month.....	14,557,282	11,999,919	16,094,607	14,641,009	12,015,148
Second month.....	15,950,215	11,849,972	13,722,723	15,966,543	14,053,765
Third month.....	17,877,432	12,714,651	14,497,385	14,159,289	14,730,912
Total	48,384,929	36,564,533	44,224,715	44,766,841	40,799,825

Average monthly production was 16,128,309 lbs., compared with 12,188,177 lbs. in previous quarter.

President MacNeill says: Designs were completed to an extent sufficient to permit of actual construction work being started upon the addition of equipment in the mills at Garfield for the purpose not alone of greatly improving recoveries in connection with such large tonnages as are now being treated, but at the same time of materially increasing the tonnage capacity of the plants. The first work in this direction is being done at the Arthur plant and it is expected to have three of the 13 sections of that plant completed in the new arrangement before the end of the year. In the meantime work on other sections will be started and carried to completion as rapidly as material can be secured. The execution of these improvements will not interfere to any serious extent with the regular operation of the plants. Work will be started on similar improvements at the Magna plant as soon as the first three sections of the Arthur plants are completed and provided material and machinery can be secured more rapidly than it is required at the Arthur plant. The plans for extending these plants are practically identical as to each.

At the end of the quarter grading was in progress for the new leaching plant, the initial units of which as now being constructed will have a capacity estimated at about 2500 tons per day. The plant upon which construction is now being undertaken should be ready for use in the spring or summer of next year, depending largely upon how rapidly construction material can be secured. The site and designs for the leaching plant have been so selected and arranged that it can readily be increased to a capacity of 10,000 tons per day, or any intermediate capacity, if operating results of the initial plant justify such increase.

Chino Copper Co.

The report of the Chino Copper Co. for the second quarter of 1916 shows net earnings of \$3,221,969. Production of copper amounted to 18,099,182 lbs., compared with 16,267,450 in previous quarter. The cost per pound of net copper produced, after allowing for smelter deductions and crediting all miscellaneous income, was 8.89 cts., as against 8.95 cts. for previous quarter.

The income account compares, as follows:

	June 30, 1916.	March 31, 1916.	Dec. 31, 1915.	Sept. 30, 1915.
Net profit from copper.....	\$3,136,278	\$2,667,416	\$2,407,919	\$1,503,846
Miscellaneous income, rents, etc.....	85,690	79,570	53,797	51,568
Total	\$3,221,969	\$2,746,986	\$2,461,716	\$1,555,414
Dividends paid.....	1,957,455	1,087,475	869,980	652,455
Surplus	\$1,264,514	\$1,659,511	\$1,591,736	\$ 902,959

Earnings are based on 27.19 cts. per pound for copper, as against 26.566 cts. per pound for previous quarter. There was no unsold copper on hand at the end of the quarter.

Copper production for past five quarters follows:

	1916. June 30,	1916. March 31,	1915. Dec. 31,	1915. Sept. 30,	1915. June 30,
First month.....	4,496,270	5,316,975	6,319,194	6,650,429	5,027,548
Second month.....	6,359,294	4,617,220	6,939,006	6,640,323	6,442,977
Third month.....	7,243,618	6,333,255	6,202,045	5,254,286	6,984,977
Total	18,099,182	16,267,450	19,560,245	18,545,638	18,455,502

President Mac Neill says: Plans have been completed for increasing tonnage and production of mill. The proposed improvements will consist:

1st. Of a new section of the mill to be used for the treatment of oxidized and partially oxidized ores which are not amenable to the metallurgical processes now employed, and of which character of ores approximately 1,000,000 tons have already been mined and stored in stock piles, leaving a large quantity yet unmined. The proposed section will have a capacity of about 1000 tons per day.

2nd. Installation of additional fine grinding machinery as an adjunct to the present five section mill. This will not only result in an increase of tonnage as applying to the

ordinary classes of concentrating ores, but will result in higher recoveries on those ores.

3rd. Installation of a plant for the retreatment of tailings from past operations. The initial plant will be to a large extent experimental, but it is believed that several million tons of these tailings can, by improved methods, be retreated at a substantial profit.

It is expected that some of these improvements can be put in operation before the end of this year, but it will take at least 12 months to complete all of them.

Copper Range Co.

In the first 6 months of 1916 the Copper Range Co. earned over \$3,000,000 net, or approximately \$8 per share on 400,000 shares. By a wide margin it was the most prosperous half-year the company ever had, but the current half of the year promises better, provided, of course, that copper now unsold brings as good prices as anticipated. The company has sold practically all of its September copper, and it is believed that sales for the last three months will be at prices which will insure earnings for the full year of from \$18 to \$20 per share.

Copper Range thus far in 1916 has paid \$4 per share in dividends, or \$1,600,000, and yet the treasury never was so strong in cash. The company does not owe a dollar and has \$3,000,000 in cash in Boston banks. It also has copper sold, but not paid for, which runs over \$750,000 in value.

Production this year will easily make a high record. It should be not less than 55,000,000 lbs. and may possibly run nearer to 60,000,000 lbs. This includes, of course, all of Champion's output in which Copper Range owns but a half interest; but Copper Range's own production should be close to 40,000,000 lbs., against 37,000,000 in 1915.

This unprecedented prosperity for Copper Range raises the question as to whether or not the stockholders are not in line for an increase in dividends in the near future. As the company has no need of further accumulating cash, the answer is that they undoubtedly are.

Magma Copper Co.

The Magma Copper Co. reports for the second quarter of 1916 as follows:

	Quarter ending June 30.	Quarter ending March 31.
Copper product, lbs.	2,232,936	2,043,784
Cost copper per lb.	10.47c	9.13c
Average price copper.	24.16	22.39
Operating profits	\$305,025	\$270,201
Average monthly profit.	101,675	90,067

Chief Con.

A report by Supt. Cecil Fitch says that 9692 ft. of work were accomplished in the 6 months ending June 30, that 42,144 tons of ore, yielding net after the payments of transportation, smelting and sampling charges, \$742,057.65, were produced. He says in part:

Metal Contents—	
Gold, ozs.	5,225
Silver, ozs.	843,535
Lead, lbs.	7,450,932
Copper, lbs.	1,795
Zinc, lbs.	519,798
Assay Values—	
Gold, ozs. per ton.	.124
Silver, ozs. per ton.	20.02
Lead (on lead ore), per cent per ton.	11.79
Copper (on copper ore), per cent per ton.	1.95
Zinc (on zinc ore), per cent per ton.	30.36
Average gross value per ton.	\$30.08
Smelting, freight, sampling, etc.	12.47
Average net value per ton.	17.61

"The net profit after the payments of all charges is \$355,791.85. A general description of the development work is as follows: The 1000 ore system has been extended in flat deposits between the 600 and 800 levels. A considerable part of the product has and now is being derived from these. Stopping is also being carried on to a small extent, in the system, at the 900, 1000, 1200 and 1400 levels. A small but good grade zinc deposit was found at and below the 1000 level. The 1400 ore system continues to produce a moderate amount of ore, this system has been extended north considerably between the 1550 and 1800 levels.

"To the north of the last mentioned system a new system has been discovered (and a stope opened up) which is known as the 1800 ore system. This ore was developed at the 1800 and has been partially proved up to the 1600 level. It has also been followed down to the permanent water level at 1820, the values there are the same as above that point. This system is now contributing about one-third of the mine's products. During the first part of this semi-annual period the mine was operated at full capacity, but during the last two months the product has been reduced owing to the inability of the smelters to take all of the ore, on account of the increased production arising from the different districts; resulting from the stimulus of the high metal prices. This congestion will probably continue as long as these prices continue."

The financial statement is as follows:

Receipts—	
January 1, 1916, on hand.	\$210,034.03
Ore sales, 6 months.	631,967.58
Interest, 6 months.	2,100.00
Eureka City Mining Co.	71,173.49
	<u>\$915,275.10</u>
Disbursements—	
Operating costs, 6 months.	\$276,265.73
Machinery and equipment.	14,995.63
Construction	8,320.48
Mining claims	144,286.99
Foughton expense, 6 months.	1,634.86
February 7, dividend No. 7.	44,033.80
May 15, dividend No. 8.	44,148.15
	<u>\$533,685.64</u>
July 1, 1916, balance on hand.	\$381,589.46

Miscellaneous Company Notes.

It is understood that suits are to be started in several states by independent shareholders of Tamarack against Godfrey M. Hyams. Main allegations will be that Mr. Hyams has caused large losses to shareholders by litigation he instituted which prevented the sales of the Tamarack property to Calumet & Hecla.

Braden Copper Co.'s production in July was about 50 per cent normal. Heavy snows and inclement weather followed by a break in the tailing dam, resulted in low, muddy water, consequently mill closed down on June 15 and did not start again until July 10. Properties of company suffered little damage from accident at the tailing dam.

The American Smelting & Refining Co. has none of its Mexican plants in operation, notwithstanding that the Greene Co.'s works at Cananea and the Moctezuma Copper Co. at Nacozari have been able to operate close to normal. The smelters of the American Smelting & Refining Co. in Mexico are located farther south of the international boundary than either the Phelps, Dodge & Co. or Greene plants, making it more difficult for a "get-away" in the event of serious trouble.

At a special meeting of the Batopilas Mining Co. stockholders, the proposed amendment to the charter, authorizing the management to conduct mining operations outside of Mexico, was approved. No action was taken on the other proposed amendment to extend the company's charter, owing to lack of sufficient proxies. Authorization of the former required approval of 270,000 shares, while 300,000 shares were needed to carry the other. Stock represented at meeting totaled about 275,000 shares out of outstanding 450,000 shares.

The properties owned outright by the Kennecott Copper Corporation produced 98,000,000 lbs. of copper in the 7 months ended July 31, placing the company well up among the leaders in the copper industry of the United States. Kennecott has a 25 per cent interest in the Utah Copper Co., and through it a one-eighth ownership in Nevada Con., and was therefore financially interested in the production of over 130,000,000 lbs. of copper in the period mention, as per the following table:

	Production, lbs.
Alaska Mines	72,150,000
Braden Copper Co.	25,870,000
Utah Copper Co. (25%)	26,000,000
Nevada Cons. (12½%)	6,600,000
Total	<u>130,620,000</u>

Copper Production and Sales at a High Figure.

Negotiations begun by the European belligerent nations to cover their prospective needs of copper for this year and part of next have resulted in a great stimulation for the red metal. The high record of sales established last April, when the total booking of all agencies was close to 400,000,000 lbs., will be broken this month, according to the prediction of producers.

The prices being realized are entirely satisfactory to the producers and mean prosperity for them for many months to come. It is interesting to note in connection herewith that the largest contracts closed thus far, in point of tonnage, are with domestic manufacturers. It was natural the producers should have given to their regular customers, who are to be with them after the European war is closed, the first chance to cover their needs. It is notable that foreign buyers who have closed contracts since have paid top prices.

Practically all of the copper available to the end of the third quarter of the year has been placed, while that for the fourth quarter has been put in a strong position by extensive contracts which go far toward absorbing the prospective output. Contracts also have been begun for early 1917 deliveries and negotiations are on which will extend over all of next year. Much of the domestic copper will go into the manufacture of munitions, besides providing the wants of regular manufacturers of ordinary trade products.

October copper sold at 27 cts., the highest price received for several months. November contracts have been made at 26½ cts. Inquiries have come into the market from American manufacturers for copper to be delivered through next February, and the price has advanced from the 25-ct. level of a few days ago.

In reviewing the production of the larger producers during the first 6 months of 1916, Anaconda ranks at the head in point of increase, producing as it did 164,500,000 lbs., or 46% more than in the 6 months of 1915. Phelps, Dodge & Co. rank second with 85,000,000 lbs., as compared with 65,000,000 lbs. in the same period in 1915. Utah Copper outproduced 84,949,000 lbs., a 26% increase over the half year of 1915.

Survey's Report on Public-Land Oil Matters.

Most people engaged in the oil business in the states containing public lands believe that the policy of withdrawing oil lands from entry began in 1909, and that the first withdrawals were based on a desire to conserve the country's natural resources. As a matter of fact, the first oil-land withdrawals of any consequence were made in 1900 and were based on petitions from oil operators who wished to be protected against the filing of agricultural entries covering the lands they were prospecting. The "oil placer" act

had been in operation about 3 years, the oil industry of the west was just entering on the remarkable activity which it still maintains, and demands came from practically every new field for the withdrawal of lands from agricultural filing so that drilling might be carried on unhampered. In 1900, 1901, and 1902 more than 20 withdrawal orders were issued by the General Land Office covering large areas in California, Oregon, and Wyoming.

After this withdrawal fever came a reaction. The withdrawn area was large and included much agricultural land, and intending entrymen and selectors called for restoration. As a result there were 3 restorations in 1902, 13 in 1903, and 12 in 1904. Then there was a quiescent period, followed by 1 restoration in 1906 and 6 in 1907. One of the early withdrawal orders was not canceled until 1910, and another, involving several townships, was left outstanding until 1912. Both were in territory which has not proved to be oil bearing.

Meanwhile, members of the Survey, working in the California fields, became impressed with the need of the oil operators for protection against agricultural filings during the drilling period, and in 1907 a large area in California was withdrawn on their recommendation. Similar withdrawals were made in 1908 and 1909, including lands in Oregon and Louisiana, as well as California. These withdrawals, although essentially similar to the early Land Office orders, were more closely confined to prospective oil territory; they probably included less agricultural land; the number of oil operators benefited had greatly increased; large withdrawals of coal and phosphate lands had accustomed the public to the withdrawal idea; and, perhaps most important, field examinations with a view to classification were carried on as rapidly as the funds available would permit. The lands shown by geologic surveys to be barren of oil were promptly restored; those offering possibilities of oil were retained in withdrawal.

Ultimate Profit vs. a Low Cost Sheet.

A great many reputations have been made and unmade by a cost sheet. There seems to be an idea among certain mining people that an engineer's ability can be gauged by this means. To a certain extent it can, but there are divers factors entering into its make-up that unless these be given consideration a correct judgment is impossible.

There are companies that will spend \$100,000 for new equipment in order to effect a saving of a few cents per ton in treatment charges; but there are other companies that would prefer to distribute the \$100,000 in dividends and incur the extra cost of treatment. Without knowing the facts of the case, it would be impossible to say which company shows the best judgment. If the saving would amount to \$15,000, annually, and there were several years of ore reserves assured, the expenditure would be warranted. Unfor-

tunately the question of ultimate profit is not always given as serious consideration as the more alluring one of a low cost sheet.

Every engineer, when he takes hold of an important mining project, has a more or less vague desire to make a reputation for himself for cheap mining and milling. Such ambition is laudable and tends to bring out the best that is in an engineer, but when the man loses sight of company profit in an effort to add to his own reputation it is time to call a halt.

Low costs do not always mean big profits. Very often in order to reduce costs it is necessary to build a plant of such dimensions that the payment of its original cost to the stockholders represents pretty near the full amount of the dividends paid.

Comparison of the cost sheet of different mines is usually unfair to one of the parties, unless the mines are in the immediate vicinity of one another and operate under practically the same conditions as regards wages, cost of power, size of plant, etc. There are, however, mines remotely situated that operate under very similar conditions, and in such cases comparisons are interesting and instructive.

There are two basic industries—mining and agriculture. Both are necessary to our present civilization. Ages ago, when humans were little better than animals, both mining and agriculture had no existence. Men ate fruits and the flesh of animals, birds and fish caught and killed by their hands or with clubs and stones. But as his intelligence increased man learned to grow his own grains and other vegetable foodstuffs. He also sought better means for cracking the heads of his neighbors and for preventing them from cracking his. He found metals and found them well suited to the fabrication of weapons, so he dug ores from the ground and smelted them in a crude sort of fashion. From these small beginnings present day agriculture and mining have been evolved. As civilization spread the demands on both industries grew more numerous and their development still continues. Agriculture must persist as long as men inhabit the earth, but what of mining? Can mining go on forever, or will man in time completely exhaust the earth's store of useful minerals? When we stop to consider the dependence of our present civilization on coal, petroleum, metals, and the other mineral products we wonder what is in store for far-distant future generations.

Silver has again shown a disposition for price advancement. Tuesday's quotation of 66 cts. represents an advance of 6 cts. per ounce since July 10, when silver dropped to 60 cts., the lowest since its spectacular rise this spring. The recent slump was attributed to selling from southern China. Liquidation from this quarter has now apparently run its course and the market is developing a decidedly stronger tone. It would cause no surprise if an additional advance was made in the next few weeks.

PERSONAL.

Julius Fohs, consulting oil geologist, has opened offices in Tulsa, Okla.

J. V. Bowman is now chief chemist for the Andes Copper Co., Chanaral, Chile.

E. L. Estabrook is now geologist for the Wisconsin Zinc Co., Platteville, Wis.

Palmer S. Gray, mining engineer of Houghton, Mich., has gone to Garfield, Utah.

S. A. Crandall is now with the Bunker Hill & Sullivan Co., at its smelter, Kellogg, Ida.

R. B. King and D. D. Fraser, mining engineers, have left Houghton, Mich., for Butte, Mont.

N. O. Lawton, conducting exploration work at Hancock, Tenn., has left for South Strafford, Vermont.

Arthur Notman, mining geologist for the Copper Queen, Bisbee, Ariz., has returned from a trip to New York.

Corey C. Brayton has opened consulting mining and metallurgical engineering offices in San Francisco, Cal.

T. R. Hunt, London, E. C., has accepted the position of manager of the San Juan Mines, Ltd., San Juan, Argentina.

W. F. Jones, recently returned from Honduras, is now superintendent of the Tough-Oakes mill, Kirkland Lake, Ont.

Kenyon Burch, engineer in charge of design and construction at the Inspiration Con. property, Miami, Ariz., is on a trip east.

A. G. Gullberg, Calumet, Mich., superintendent of motive power for the Calumet & Hecla Copper Co., has returned from a trip to Europe.

N. C. Whitten, Great Falls, Mont., has resigned as flotation foreman for the Anaconda Copper Co., and will leave for Cerro de Pasco, Peru.

Carl J. Trauerman, mining engineer, has resigned as mill superintendent for the August Mining Co., but will retain his headquarters at Butte, Mont.

C. A. E. Blanchet, Ottawa, Ont., is investigating conditions for the Canadian government at the asbestos mines around Thetford Mines, Quebec.

Henry M. Howe, professor of metallurgy, Columbia university, has been made honorary vice-president of the Iron and Steel Institute of Great Britain.

William B. Phillips, former president of the Colorado School of Mines, will resume a consulting mining and metallurgical practice at Austin, Texas.

A. B. Shepherd, Pittsburgh, Pa., general manager of mines for the Jones & Laughlin interests, is touring the iron districts of Lake Superior inspecting company property.

J. C. Devine has resigned as assistant superintendent of the Ray Con. Copper Co. to devote his attention to prospects of the Pinal Development Co., of which he is president.

E. Thornton, Twin Buttes, Ariz., with the American Smelting & Refining Co., has changed his headquarters to Silverbell, Ariz., where he will have charge of the Imperial mine.

Capt. J. P. Hodgson, formerly mine superintendent at the Copper Queen mine, Bisbee, Ariz., has been promoted to the mine department of Phelps, Dodge & Co., in a consulting capacity.

Howard C. Parmelec has been elected president of the Colorado School of Mines at Golden, Colo., succeeding William B. Phillips, recently resigned. He is president of the Colorado Scientific Society and is well known for his ac-

tivities in scientific research work. He has also been connected as chemist with a number of mining companies and with various publications as an editorial contributor.

Assistant Professor T. G. Chapman, of the metallurgical department of the Michigan College of Mines, has resigned to take charge of the same department in the University of Arizona at Tucson.

Robert Livermore will resign as manager of the Kerr Lake mines, Cobalt, Ont., to become consulting engineer for the company with offices in New York. The resignation will take effect Sept. 1 and the vacancy will be filled by Harry E. Kee.

F. B. Close, who developed the White Pine Extension and the Algonac, and Prof. A. E. Seaman, head of the geological department at the Michigan College of Mines, have gone to the Golconda silver district of Canada to examine some properties.

OBITUARY.

James Mason, a pioneer prospector and discoverer of the Klondike district, recently passed away near Carcross, Alaska.

Robert S. Towne, connected with many Mexican mining enterprises passed away at the Engineer's Club, New York, on August 3, at the age of 58 years.

C. J. Daman, a 1913 graduate from the Colorado School of Mines, recently passed away in Butte, Mont., from the effects of an attack of pneumonia. At the time he was in the engineering department of the Anaconda Copper Co.

Robert Strain, a 1914 graduate from the University of Princeton, was accidentally killed at the flotation plant of the Burro Mountain Copper Co., Tyrone, N. M., on August 13. The accident occurred when he spilled a quantity of cresylic acid, the fumes, rather than burns, having been determined as the cause of death.

SCHOOLS AND SOCIETIES.

American Institute of Mining Engineers.—The institute makes announcement of its absorption of the Mexican Institute of Mining and Metallurgy, which will hereafter be known as the Mexican section of the American organization. The Mexican institute was founded in 1909 by its present president, Victor M. Braschi of Mexico City. Its decision to merge with the American organization is due to difficulty in financing its affairs owing to national troubles in Mexico, and as a result of the merger the Mexican institute will now be financed by the combined organizations. The American institute thus gains to its membership more than 200 of the mining experts of Mexico, increasing its total membership to 3800.

Lake Superior Mining Institute.—Secretary Yungbluth has announced that the twenty-first annual meeting will be held in Birmingham, Ala., March 13 to 17, 1917. Action was taken by the council after the members of the institute in Birmingham had extended an invitation to hold the next meeting in the great iron and steel center of the south. The institute members will assemble in Chicago and will travel in a special train over the Queen and Crescent route to Birmingham and return. It is proposed to spend a day at Chattanooga for sight seeing, with probably some other stops. The institute council has voted the sum of \$1000 to assist in defraying the expenses of the trip. It is estimated that the round trip from Chicago, including sleeping car accommodations and meals, can be made for about \$70, less the amount which the institute has contributed. Arrangements will be

made so that those who desire to stay in the south until a later date will be able to do so.

American Institute of Mining Engineers.—For the first time in its history of 45 years the American Institute of Mining Engineers will next month meet in the state of Arizona. Sessions of the meeting will extend over the entire week of September 18 and will be held in the principal mining centers of the state, the members traveling between the various points by special train and automobile. Principles of mining and metallurgy of the greatest interest will be presented at the technical sessions.

The principal towns in which the Institute sessions or visits of inspection will be held are Santa Rita and Hurley, N. Mex., and Douglas, Bisbee, Globe and Phoenix, Arizona. The inspections will include the Roosevelt Dam and the mines and works of practically all the leading metal-producing companies of the state. At Douglas, in the technical sessions, the Institute will discuss the special subject of "Smelting." At Bisbee papers will be read on "Mining and Geology," and at Globe the first day will be given over to "Mining and Smelting" and "Leaching." During the second day at Globe time has been set aside for what is regarded as an important discussion of "Concentration and Flotation."

The company plants that will be visited are as follows: At Hurley, the mines and works of the Chino Copper Co.; at Bisbee and Douglas, the mines and works of Copper Queen Consolidated Mining Co., Calumet & Arizona Copper Co., and Shattuck Copper Co.; at the Globe district, mines and works of Inspiration Con. Copper Co., Miami Copper Co., Old Dominion Copper Mining & Smelting Co., together with the new works of the International Smelting Co.

An elaborate entertainment program is being planned by the Arizona committee, comprising Gerald F. G. Sherman, chairman, Arthur Notman, secretary, Norman Carmichael, W. G. McBride, John C. Greenway, W. L. Clark, B. Britton Gottsberger and Forest Rutherford. The committee on transportation is composed of Walter Douglas, chairman, Cleveland E. Dodge, secretary, Arthur S. Dwight, John C. Greenway and Julius Kruttschnitt, Jr.

COMMUNICATIONS.

[This department is for the exchange of ideas bearing on all branches of the mining and metallurgical industries. Mining and Engineering World will not be responsible for the statements made nor opinions expressed by correspondents.—Ed.]

The Webb Bill.

The Editor—The President directs me to acknowledge the receipt of your letter of August 17th, and to say to you that he not only has this matter very much at heart, but has taken an active part in attempting to find the right solution for it. He feels confident that legislation of this sort can be accomplished, if not at this session of Congress, at any rate in time to meet the necessities of the case.

Sincerely yours,

J. V. TUMULTY,
Secretary to the President.

Death of Sir William Ramsay.

The Editor—The news of the passing away of Sir William Ramsay reminds me of my short association with the distinguished chemist in 1896, when his name came into great prominence on the confirmation of the composite nature of atmospheric nitrogen and on the separation by Lord Rayleigh and Sir William Ramsay of argon, and of the other elements found in minor quantities in atmospheric nitrogen.

This separation of the elements associated with atmospheric nitrogen, came like the isolation of fluorine by Moissan, at a time when the progress of chemical technics rendered this operation possible. Long ago, Cavendish concluded that nitrogen in the atmosphere was associated with other elements in minor quantities, which did differ from the nitrogen

by not being reduced to nitrous acid. At a later date, Professors Fremy and Leduc, in France, in 1882, expressed their doubts that atmospheric nitrogen was not a simple element; and J. J. Thompson and Threefall published certain experiments (R. Soc. Proceed., 40) on the contraction undergone by nitrogen on electrolysis at low pressure, attributing this fact to an allotropic modification of nitrogen.

At this stage, Lord Rayleigh and Sir W. Ramsay, observing that the density of atmospheric nitrogen was different from that of chemically prepared nitrogen, came to the conclusion of the composite nature of the former, and separated from atmospheric nitrogen the new element argon, of higher density and even more inert than nitrogen, thus confirming the general anticipation of Cavendish in 1781 and achieving one of the most brilliant chemical discoveries of the 19th century.

Mendeleieff's classification guided Sir William Ramsay continually in his study of atmospheric gases. The extension of this investigation lead, later on, Ramsay and Travers to the discovery of crypton, neon, xenon, and of helium, utilizing the methods discovered by Dewar and Linde in the fractionate distillation of liquid air and of argon.

Besides his important work in the domain of pure chemistry, Sir William Ramsay did considerable work in many of the branches related with metallurgical research, and was consulting chemist of several industrial concerns. In 1896, he conducted, together with the writer, a series of tests on the application of the halogen compounds of cyanogen for the extraction of gold and silver from refractory gold and silver ores—successively on the bromine treatment of Transvaal and Natal gold ores; on extraction of gold from sea water, and on hydro-metallurgical treatment of Welsh zinc ores; in the interest of various mining companies.

In recent biographies, this part of the scientific activity of the gifted scientist has been overlooked and I am glad to take it from the oblivion of which it has suffered, eclipsed by his more brilliant achievement in connection with the separation and obtention of the elements of the air, of helium; and with this extensive work on radium and radio activity.

BAXERES DE ALZUGARAY.

NEW PUBLICATIONS.

Spirit Leveling in Maine, 1899 to 1915. By R. B. Marshall. Washington, D. C., U. S. Geological Survey. Bulletin 633; pp. 64; illustrated. For sale by Mining World Co. 15c.

All U. S. G. S. bench-marks are given with their elevation and a brief on their location.

The Strength and Stiffness of Steel Under Biaxial Loading. By Albert J. Becker. Urbana, Ill., University of Illinois. Bulletin No. 85; pp. 65; illustrated.

The results of the many tests made are plotted into curves and tabulated. The tests were made to determine the laws governing the strength of mild steel when subjected to two tension stresses at right angles to each other or by compression and tension stresses at right angles to each other.

Gas Analysis as an Aid in Fighting Mine Fires. By George A. Burrell and Frank M. Seibert. Washington, D. C., U. S. Bureau of Mines. Technical Paper 13; pp. 16; illustrated.

In briefly describing methods of analyzing and sampling mine gases in different parts of the mine, it has been the intention of the Bureau to enlighten the factors related to the starting and spread of mine fires and one of the large factors affiliated therewith is the nature of the gases. Methods of controlling these gases by relief pipes, etc., are described and the changes in mine air during fires are reviewed.

Possibilities of Oil and Gas in North-Central Montana. By Eugene Stebinger. Washington, D. C., U. S. Geological Survey. Bulletin 641-C; pp. 43; illustrated.

With the occurrence of oil and gas in nearby areas and the possibilities of furnishing fuel for the western states as

coal is so conveniently furnished in our eastern states this subject is of considerable importance. The geology of the district is taken up in the best possible manner, considering that most of it was not obtained from an original investigation of the field with respect to the possibilities of oil and gas occurrences, but rather from various U. S. G. S. reports. Only information tending to show the probability of oil in the district is gone into, the number of operating companies as yet being small.

Silver City, New Mexico, Folio. By Sidney Paige. Washington, D. C., U. S. Geological Survey. Folio No. 199; pp. 19; illustrated.

The geology of the formation and topography of the Silver City quadrangle are gone into in detail. The area covered includes many of the large deposits of the state. The formation, in being described, are taken up according to the different geologic areas in which they belong. Following this information is an account of the geologic history of the country and a review of the nature and genesis of the ore deposits and formation related thereto. Many large, separate topographic and geologic maps of the quadrangle are reproduced.

TRADE PUBLICATIONS.

Sydra-Static Indicators. Scientific Material Co., Pittsburgh, Pa. Bulletin No. 4; illustrated.

These draft-indicators and recorders are constructed similar to a U-tube manometer and the construction and operation of the same is gone into at some length. Views and tables listing the different sizes made are shown.

Oxy-Acetylene Apparatus. Searchlight Co., Chicago. Folder; illustrated.

Attention is called to the applicability of this method of repairing in different industries. The different welding and cutting apparatus which can be supplied is shown and brief descriptions of the equipment furnished therewith are given.

Portable, Direct Reading, Slide Wire Ohmmeters. Roller-Smith Co., New York. Bulletin No. 300; pp. 4; illustrated.

For the determining of resistance in the transmission of electricity this type of portable meter has been found of considerable use in practice as well as the laboratory. A description and drawing of the same are reproduced with a table giving price and ranges for different sizes.

Boiler Tube Cleaners. The William B. Pierce Co., Buffalo, N. Y. Booklet; pp 20; illustrated.

The booklet is titled "The Logic of the Dean" and illustrates and describes the Dean boiler tube cleaner besides discussing the problem of scale accumulation. It is intended primarily for the management though considerable information of value to the chief engineer and his assistant is given.

Chain Belt and Sprockets. Chain Belt Co., Milwaukee, Wis. Price List No. 65; pp 15; illustrated.

The prices given in this list took effect July 15, 1916, and supersedes all previous lists. Descriptions, drawing, tables of details and prices, and illustrations of each article are given. Iron elevator buckets, chain belts for transmitting or driving with sprockets and sprocket wheels are among the principal things considered.

Jaw Rack Crushers. Traylor Engineering & Mfg. Co., Allentown, Pa. Bulletin J 1; pp 21; illustrated.

As a foreword it is stated that the capacity of the company's shops has been trebled and they are now in position to make deliveries without delay. Crushers for a large variety of uses are considered. The all-steel jaw crushers are first described as regards their design and operation in general. Here several types of this class are spoken of and good illustrations of the same are given with complete

tables of data in each case. Jaw crushers capable of being taken down into sections are then described in a similar manner. These have a 3000-lb. limit and have been designed for use where the crusher must be taken in by sections on mule back over mountain trails. The Dodge type of jaw crushers are taken up, as also are revolving screens, rolls and gyratory crushers. In each case the adaptability of the particular type is suggested and information of general use in rock crushing is given with information on the company's own products.

Computing and Payroll Machine. International Money Machine Co., Terre Haute, Ind. Catalog; illustrated.

The machine gives directly the total of the payroll and number of coins or bills necessary to complete the payroll. The machine also delivers the correct amount into the pay envelope in the smallest number of coins and bills. A list of companies using the machine is given and mention is made of an adding and listing machine recently designed by the company.

Insuluminum Pipe. Diamond Power Specialty Co., Detroit, Mich. Bulletin 118; illustrated.

This new material it is stated will withstand a temperature of 1800 deg. F. instead of 1200 deg. which is the customary figure for iron and steel. Photo-micrographs of the material are shown and its properties are discussed. Description is given of comparative costs with other metals and the concluding pages deal with the application of the material in the construction of a mechanical soot-blower system.

Metallurgical and Assaying Furnaces. The Denver Fire Clay Co., Denver, Colo. Catalog D; pp. 96; illustrated.

Case metallurgical furnaces are dealt with entirely. Many types and installations are illustrated and each is accompanied with a brief description. Accessories, such as burners, crucibles, etc., are included and the furnaces described include types using oil, gasoline, gas, coal, coke or wood. Designs for the following purposes are described: Melting, refining, assaying, tempering, annealing, enameling, forges and rivet heaters.

Motor Trucks. Federal Motor Truck Co., Detroit, Mich. Pamphlet; pp. 64; illustrated.

Deals with worm-driven motor trucks and in bringing out the practical application of the trucks a number of views are shown of the truck being put to some of its many uses in the field. The handling of numerous classes are illustrated. General description of the driving and other mechanism is given and followed by engravings of the different styles and sizes of trucks. Brief specifications of the different trucks are given in connection with illustrations of different styles of bodies.

INDUSTRIAL AND TRADE NOTES.

The Frontenac mill at Black Hawk, Colo., has been purchased by the Morse Bros. Machinery & Supply Co., of Denver, who will dismantle it and move the material to Denver. The plant was a 250-ton concentrating mill consisting of crushers, rolls, tube mill, Traylor jigs, Card and Diester tables, all electrically operated. The plant was built in 1912 and operated about 9 months.

The Stimpson Equipment Co., Salt Lake, lately sold to the Cardiff Mining Co., a Laidlaw-Dunn-Gordon air-compressor, 850 cu. ft. capacity, which is being installed at the Cardiff mine, in Big Cottonwood canyon, Utah. This is the second compressor of that type sold and installed at Cardiff mine. C. W. Stimpson, president of the company, who recently made a trip east, returned last week via Denver. While in the east he placed equipment for a complete oil flotation plant in northern Michigan, in which Janny machines are to be used.

Late News From the World's Mining Camps

Editorial and Special Correspondence.

ALASKA.

Anchorage.

Supt. H. C. Emory states that a record year will be made by the Martin mine in the Willow Creek district. The mill will be run until late in the season and probably all winter.

The Number Nine Mining Co., on Fairbanks creek, had a clean-up recently. Four men were working on the ground and the clean-up showed close to \$2,000 for each man.

C. J. Wall and C. Pope Hawatt, eastern capitalists, are inspecting the W. W. Woodard placer claims on Kichatna creek, a tributary of Yentna river. They have gone in with a complete power drilling outfit and a large supply of provisions and accessories to thoroughly prospect the claims for dredging possibilities. The claims extend 8 miles up the Kichatna from Gold Hill and are located in a neighborhood that has been producing for many years. If the property proves as expected Wall and Hawatt will close their deal and install a complete dredging plant next spring.

Hopes are being held that a smelter will be constructed here to treat the gold and copper ores from the Broad Pass district. With depth the Willow Creek mines may find basic instead of free-milling ores and these too could then be treated at Anchorage. Anchorage is well located with respect to both water and railroad transportation.

Iditarod.

It is rumored in the Kuskokwim and Innoko countries that there will be a dredge installed on Candle creek at an early date. The machinery will be received at McGrath or some other point on the upper Kuskokwim this summer ready for freighting to Candle creek during the coming fall and winter.

The Flume Dredging Co. is securing options on large tracts of ground in the Innoko district with the object of installing a dredge. It has purchased a half interest in the Mayflower association and has taken options on several claims on the lower end of Yankee creek. The ground is low-grade and a gasoline drill is due in September.

A wagon road is being built from Big creek to Ganes creek by Thorns & Higgins, and the new road will reduce the cost of hauling from the Kuskokwim river to the Innoko mines. Launches are able to bring loads of considerable size from the Kuskokwim up Big creek, and then it is hauled by wagon to Ganes creek.

Ruby.

At present little is being done in the Tolstoy camps. In reviewing the work being done however it is stated that good prospects have been found on 4 above on Esperanto creek by Henry Madison. The only other work being done on that creek is a hole being sunk by Charley Armour, Alex. Holmberg and Orlof Stenbock.

Seward.

P. F. Cummings has purchased the placer mining properties on Bear creek from Herron, Cassidy and Sullivan. He is on his way outside to secure a hydraulic plant with which to operate the new property.

Another large dredge has been constructed and is now operating on Cache creek.

Skagway.

Activities at the Venus mine have been resumed after a number of dormant years. A moderate crew is reopening the Col. Conrad properties on Windy Arm. A considerable amount of ore has been broken and sacked for shipment to the smelter. An assay office has been opened to permit ex-

tensive assaying of the ore taken from that and other properties being developed by the company which has taken over the Conrad properties. Indications point to a successful career for the Windy Arm property.

ARIZONA.

Prescott.

Among the properties which bid fair to add to the output of copper from the Jerome field—now so generously sustained by the United Verde, United Verde Extension and Copper Chief mines—is the Pittsburg-Jerome. In early August announcement was made of a strike of copper ore. Recent information is to the effect that the vein, while narrow at present, is widening as the drift is extended. The discovery was made in a drift from the west crosscut on the 500 level about 70 ft. from the shaft. The first samples taken gave returns of 11% copper and some gold. Samples taken after drifting a short distance gave returns of 22.28% copper and values in gold. The vein pitches away from the shaft and gives indications of becoming an ore body of size. A winze has been started in the vein and to its present depth has carried good values in copper and some gold.

The directorate of the Venture Hill Co., owner of valuable acreage in the Jerome copper belt, has authorized the purchase of mine machinery and the sinking of a 3-compartment shaft to a depth of 1500 ft. This action is in line with the recommendations of John S. Riley, the engineer who has been in charge of development since reorganization of the company was perfected about three months ago. Pending the installation of machinery work will be continued in the tunnel. As the latter penetrates further into the hill mineral indications continue to be favorable. Assays made on ore mined in an old shaft on the property gave returns of \$27 copper and \$1.44 silver. The tunnel is being driven in the dike from which these values were obtained and through it determinations for the deep shaft will be made.

Fairview.

Gold values of \$83.51 and silver values of \$7.08 per ton are being obtained at shallow depth in the new shaft being sunk at the mouth of the tunnel on the Fairview group of claims in the Crown King country. Sulphide ore is also exposed there. The objective of the shaft is a depth of 200 ft., where the ore body will be crosscut and developed. Montana mining men are backing the venture. They express themselves as being well satisfied with the showing and with the property's future prospects. The Crown King field has for years been notable for its output of high grade gold-silver ore, values running from \$250 to as high as \$1000 in fair tonnage.

The Wildflower group is being developed by men headed by F. S. Viele, Le Roy Anderson and David B. Gemmill of Prescott. The new operators are unwatering the old workings, retimbering the shaft and otherwise placing the mine in shape for resumption of ore production. As the ore bodies are developed shipments will be made to the Randolph-Gemmill Reduction plant at Crown King. Messrs. Viele, Gemmill and Randolph dominate the affairs of the latter.

Jerome.

Mining men of the Jerome field are manifesting more than ordinary interest in the future of the Jerome Victor Extension property, formerly owned by the Haynes Copper Co. The acreage lies in the center of the area represented by the United Verde and United Verde Ext. mine. Developments in both of the latter have a bearing upon the explora-

tion work that will be started in the Jerome Victor at the 1200 level as soon as the shaft has been unwatered and repairs made. Superintendent Salisbury hopes to begin underground operations within a few weeks. On the 1200 level the short crosscut run by the Haynes Co. is to be extended to the United Verde line with the object of tapping the continuation of the ore body that has been stoped in the last mentioned mine on the 1400 level to within a short distance of Jerome Victor acreage. The topography of the intervening country is such that the 1400 level of the United Verde corresponds closely with the 1200 level of the Jerome Victor.

Mineral conditions continue to improve as development progresses on the property of the Great Southern Mining Company. Recent assays gave returns of 1.6 ozs. gold and 4 ozs. silver. As the drift on the lower level is extended the ore body is widening and appears to be entering the area in which it makes juncture with a cross-fissure. The property is located in the McCabe section and is adjacent to mines that have added millions to the mineral wealth of Yavapai county.

Quartzsite.

The work on the plants of the Yuma Con. and the Plomosa Cos. is progressing as fast as delays allow. The Plomosa Co. expect to begin operations no later than September. This company had expected to have plant completed by July 1, but warm summer, with the delay of machinery, has delayed work.

The Yuma Co. will have a 2000-yd. and the Plomosa Co. a 1000-yd. plant. At present great interest is centering upon a deep hole on the Yuma Co.'s ground, the first of its kind in that section, intended to be an experiment. This hole which is 140 ft. deep has been a revelation. At the surface the gold was rather fine, at various depths rich seams were cut that averaged in width from 1 ft. to 20 ins. in width and ran as high as \$12 per yd. A hard strata of cement was then penetrated, which also carried finer gold values and then the layer of bedrock gravel was encountered, which was found to be very thick, of this seam 15 ft. above bedrock averaged better than \$6.65 per yd., while the whole bed of gravel and cement to the surface gave better than \$2 per yd., thus proving that for work in a large way the deeper ground of the district may be found to be even better than the partly worked and shallower ground; the later areas still producing ground that will go better than \$12 per yd. The test plant that was erected at an approximate cost of \$65,000 embodies the Stebbins dry concentrator.

Oatman.

East and west drifts in the Telluride on the 475 level are in vein matter which resembles the vein matter in the United Eastern, Tom Reed and Big Jim, and the operators expect to break into pay ore with any round of shots. This is a property of Long & McIver, who developed the United Eastern.

Official confirmation of the deal whereby Seely W. Mudd, Frank A. Keith, Phillip Wiseman, D. C. Jackling and R. I. Rogers, associates in the United Eastern, have taken a controlling interest in the Sunnyside, adjoining the Telluride on the south, has now been made. The price involved is about \$100,000. The Telluride sidelines the Lucky Boy on the north and the Sunnyside endlines it on the southeast. The Lucky Boy is now arranging to resume operations.

Oatman Combination has started crosscutting on the 500 level, and will drive north and south to cut the two veins between which the shaft was sunk.

United Northern shaft is now down a little over 400 ft. and engineer Goldsworthy reports stringers of rich ore which indicate to him that the vein will contain pay ore when encountered.

The Chicago Syndicate Co. has started crosscutting at 250-ft. depth.

The Fessenden Co. has suspended operations until about Sept. 15th. The property is a "hot" mine, and during the hot weather the temperature in the workings has increased to 125 degrees, with little relief for the miners when they come above ground in the day time. At the same time

negotiations are being concluded with Pittsburg financial interests which desire to take control of the company. Semi-official information is to the effect that the deal will probably be consummated.

The shaft of the Tipperary has attained a depth of 200 ft. and will be carried to 300 ft. before lateral work is started.

Arrangements are being made to start work on the Arizona-Comstock and Dardanelles properties, south of the Times.

The Wrigley Exploration Co. is asking for bids on driving 600 ft. of its big cross-cut tunnel, which is now in about 100 ft.

The Gold Road, Gold Ore and Tom Reed companies continue their usual steady production, the Gold Ore milling some 30 tons per day in the Gold Road plant.

CALIFORNIA.

Bishop.

The 300-ton mill of the Tungsten Mines Co. is operating on ore from the Little Sister and Jackrabbit mines, with sufficient profitable ore exposed to insure 8 years of activity, according to company officials. It is claimed tungsten can be produced at \$3.25 per unit, and that at present price of the metal gross daily earnings will approximate \$5250. The company has expended fully \$100,000 in development and equipment of its holdings. L. E. Porter is superintendent.

Shipments of silver-lead ore are being made from the Santa Rosa, in the Keeler district, at the rate of 30 tons daily. The product is high-grade and late developments have uncovered wide bodies of ore. On the dumps a large tonnage of milling ore is stored.

The Troeger tunnel of the Buena Vista Co. is in nearly 7000 ft. and is apparently nearing the last series of veins it was designed to intersect. Several excellent ledges have been already cut and preparations are being completed for extensive lateral developments.

Carrville.

The lower tunnel in the Golden Jubilee mine has intersected an 11-ft. ledge of promising ore below the main workings. Preparations are being made to drift on the ore and determine its value and extent. Arrangements were recently made to reconstruct the mill and install a new process for treatment of the refractory ores.

The last lot of equipment for the new dredge of the Trinity Development Co. has been delivered, and is being installed. Within a short time the big boat will go into commission, and steps have already been taken for the construction of 2 more dredges in the spring of 1917.

Copperopolis.

The Calaveras Copper Co. is installing a Hardinge 8-ft. conical mill, Dorr thickener, 11 pneumatic flotation cells, and an Oliver filter. This will increase the capacity of the flotation plant to about 600 tons per day. The new 3-compartment shaft has been completed to the 6th level, and extensive lateral work is proceeding from numerous points. A rock-crushing plant with a capacity of 1500 tons per 24 hours has been installed. Sufficient ore is exposed to insure a long run of the plant. S. M. Levy is manager.

Taylorville.

Preliminary work is proceeding on the railroad from the Engels copper mine to Keddie, and the contractors expect to have the line in operation before winter. Additional equipment is being installed at flotation plant and its capacity will be eventually increased to about 2000 tons daily. This will make the company the largest copper producer in California. Driving of the new 4000-ft. tunnel is progressing rapidly.

Enterprise.

Work has been resumed at the Southern Cross, with A. E. Eagle in charge. The company has decided on the building of a flotation plant, and has ordered a tube mill and 40-hp. gasoline engine. At a depth of 70 ft. a 7-ft. ledge of good ore is exposed and arrangements have been made to

send the shaft to a depth of 300 ft. and extend drifts to tap the vein.

Nashville.

Sinking of the shaft of the Montezuma mine has been completed to a depth of 1000 ft. and drifting from this level to intersect the vein has begun. Ore of excellent character is exposed on the 300, 500 and 800 levels. It is planned to provide reduction facilities as soon as developments on the 1000 level have become satisfactory, and it is likely the plant will resemble the mill at the Plymouth Con. Roy Le Fountain is superintendent.

Magalia.

The Mineral Slide drift mine has been taken under bond and option by John Cowan and associates of Salt Lake, and work started with a force of 12 men. The ditch and flume line is being repaired and preparations made for the driving of a 1500-ft. bedrock tunnel. This is expected to intersect the rich channel which has yielded millions in gold. The Mineral Slide is credited with an output of \$1,000,000 and contains large areas of promising virgin ground. C. E. Hand is in charge of the work.

Sutter Creek.

Unwatering of the Old Eureka has been completed to a point beyond the 600 level and a 4th pump has been installed, the latter machine being in position at the 600 level. The timbers continue to be found in excellent condition and the management expects to start active mining at an early date.

Nevada City.

The St. Louis Mining Co. has been formed with a capitalization of \$200,000 to operate the St. Louis mine in Willow Valley. H. H. Estee is president; John T. Hennessey, secretary; W. H. Martin, treasurer; William Reynolds, W. B. Celio and C. F. Van Duzer, directors.

Work will probably be resumed in the Murchie group in the near future according to advices from New York. An option was taken on the property several months ago by New York people, and it is said definite arrangements have been practically completed for vigorous developments. The mine formerly ranked among the leading producers of this district.

COLORADO.

Georgetown.

The Onondaga Mines Co. is pressing work in the Kane tunnel. A compressor and various other supplies have been delivered at the adit and the foundation for the machinery is being put in. A hoist, motor and pipe will shortly be there, and when the installation is completed, work will be commenced on sinking 250 ft. to connect with the raise from the Capital tunnel. On the 450 level going west there is a large body of ore in ground now belonging to the company, as also is in the Capital Co.'s ground. From this it may be taken that when the air connection has been made with the Kane adit and the drill hole from the summit of the mountain, both companies will have good ore bodies to work on. The only block of ground which has been stoped out by Onondaga is that which lies between Nos. 1 and 2 raises from the main tunnel, and from the 100 level up to the 150. This ground produced \$12,000, and a good body of ore is showing above the 150 level. At No. 3 raise the ore body is 40 ft. wide. Water pours down this raise in a large amount.

Oscar Wing and W. E. Swanton, operating the Birthday group of four lode claims on Griffith mountain, under lease and bond have been cleaning out and getting the upper level 60 ft. from surface in shape. A blacksmith shop and sorting house have been erected and other preliminary work completed. The level crosscuts for 75 ft., at which point the Birthday lode was encountered and drifted on 80 ft. each way, showing a continuous vein of ore varying from 4 to 16 ins. wide, and carrying values in gold and silver up to \$80. The work now under way is being done in the west drift, and the character of the ore is changing, showing more copper and lead. The Birthday is a continuation of the Alaska

and Cass County vein from which considerable iron pyrites was mined, running high in gold and silver. There is a lower tunnel driven to develop the group as a whole, which enters the mountain 80 ft. above the level of the Capital tunnel, and is in a distance of 300 ft. It would open up the Birthday at 700 ft. previous to encountering the other veins of the group. The Birthday can also be worked at depth through the upper tunnel of the Capital mine, where it was encountered at 700 ft. from the portal.

Boulder.

The Red Sign mill in Boulder canyon has been completed and tests have been run showing all is satisfactory. The mill was put up by the Colorado Iron Works Co., Denver, for the Tungsten Metals Corporation. A crew of mill men headed by Thos. McSherry, and extra men for work in the mines, have been employed to keep the mill going.

Sugarloaf.

The roasters at the U. S. mill and smelter have been cleaned after 9 months of continuous operation. During this time oxidized ore was treated at the mill and the high grade ores that have to be roasted were sent to the bins. This put the bins about 2 weeks ahead of the roasters. A new dust collecting system was also installed. A screw conveyor will carry the dust, which formerly had been kept down but not saved, into the lower grates of the furnace where it will be treated for metal that it carries. Because of the intense heat in the lower grates the dust must be conveyed there by machinery. It is estimated by officials of the company that the saving made by treating the dust will amount to \$10 a day. Operations were resumed about Aug. 17.

The Nyanza winze in the Livingston property is showing up well. Work is now being done at the edge of an ore shoot that gives indication of being better than anything yet encountered. A recent 500-lb. shipment of this ore was sold to the Chamberlain sampler which ran \$165 a pound or \$32,700 a ton in gold and silver.

Cripple Creek.

The breccia-schist contact has been cut at the 750 level of the Jerry Johnson mine. Assays indicate a shipping value for the first shipment of \$20 to \$30. A rich streak several inches wide is now exposed in the breast of the drift that returns gold values of \$125 a ton. Returns have been received from lot No. 44 sent out by the Cripple Creek Deep Leasing Co. operating below the 650 level of the main shaft, and mined from the 850 level. The lot carried a gross bullion value of \$1063.80, and average value per ton of \$37.20. It is now planned to crosscut to the contact from the 950 level of the Jerry Johnson shaft. Should values hold at this depth, a winze sunk below the 850 level, having returned from \$20 to \$35, the Deep Leasing Co. will commence this work and may resume sinking. The company has two lots of ore, Nos. 45 and 46, awaiting settlement and will be loading out other shipments including the lot from the 650 level this week. Since last October when shipments commenced, this lease was produced in excess of \$30,000.

The Smith, Moffat Mines Co. has taken over the Victor mine, with the Little Joe, Panther and Victor No. 2 mining claims, originally owned by the Victor Gold Mining Co., incorporated in 1893, but now defunct. The production from the Victor mine is estimated at \$2,500,000, the last official figures on the mine output made public gave the production to Jan. 1, 1900, at \$2,216,671, with dividends paid to that date of \$1,155,000. The last dividend paid by the Victor Co. having been paid in 1898. The main shaft is 1000 ft. deep, with 14 levels, and 3 miles of tunneling. Eight levels were made in the first 450 ft.

IDAHO.

Cataldo.

Five teams have been found unable to haul the ore from the Hypotheek mine to the railroad. Only one round trip a day can be made and each team hauls 4 tons. Concentrates are piled up at the mill on improvised platforms and in all spare space in the mill. Most of the ore that is being milled is taken from stopes on the 900 level. The showing of ore

on the 1100 is not so good as expected. However, in other mines of the district lean spots have been found and succeeded by large bodies of ore on the next level. It is believed that this will be the case when the 1300 level is reached on the Hypotheek. The company is employing 40 men.

Wallace.

Lead ore from the Chicago-Boston has been found unyielding to the H. E. & M. mill's process and both mine and mill have been shut down for the time being. A good body of silver-lead ore has been opened and there is now in the face of the drift and has been for a considerable distance 14 ft. of good milling ore, containing streaks of high-grade that is sorted for shipment direct. With this showing there was nothing to be gained in taking out the ore and piling it on the dump, making it necessary to handle it again when the milling facilities are provided. Plans of the management in this respect have not been announced, but it is probable arrangements to resume will be effected within the next week or 10 days.

The Big Creek Mining Co. has started a lower crosscut, which will explore the vein 500 ft. below the present lower tunnel, the ground above which is being operated under lease. A trail 5 ft. wide has been completed from the creek to the tunnel site, and is built on a wagon road grade which can be easily transformed into a wagon road if desired. A special iron truck has been made to haul over the trail which will carry a load almost equal to a wagon, and the width of the trail will permit utilizing two horses in drawing it. Boarding house and other buildings have been completed and everything is in readiness for the installation of the compressor, which will be placed at the portal of the tunnel, within 100 ft. of the electric power line. The silver ore that is being mined in the leased ground fully justifies the expectation that a large body of equally good ore will be exposed by the new crosscut.

Kellogg.

Transfer of the control of the Highland-Surprise Co. is being rumored. The stockholders of the company have under consideration a proposition for the sale of the controlling interest or the entire capital stock to G. A. Lauzier of Butte. The proposition is on a basis of 20 cts. per share, payable on the following terms: First payment on Nov. 1 of 5 cts. per share; Feb. 1, 1917, 5 cts. per share; Aug. 1, 1917, 10 cts. per share. Stockholders are requested to deliver their stock to the First State Bank of Kellogg to be delivered to the purchaser upon making the payments as above set forth. Failure to comply with the terms will result in canceling the agreement and forfeiture of all payments made. In a circular letter, issued under date of Aug. 12, W. W. Papesh, president of the Highland-Surprise, submits the proposition and urges its acceptance.

Idaho Falls.

McCoy creek gold placers, controlled by H. L. Rasmason and others, Salt Lake, are under bond to persons who are testing the ground thoroughly, with a view to organizing a company to take over the property. In case they so decide, they will build two dredges to operate there. McCoy creek flows into the south fork of the Snake river at a point due east of Blackfoot. The ground under control extends 18 miles along the creek, and includes old placer diggings of early days. The camp is 72 miles southeast of this city.

LAKE SUPERIOR.

COPPER.

Houghton.

Franklin's cost for July was down to 15 cts. and for the present month the yield has been nearly up to 15 lbs. a ton; and the smelter returns were 275,000 lbs. of refined copper. This noteworthy increase in the yield is due to the drifting and stoping that is being done in the ground to the south of the shaft where the whole area is better than that so far opened to the north. A point about 400 ft. south of the shaft has many stretches of very rich ground which are continuing in all of the drifts. The tonnage owing to the scarcity of men over the whole district is hardly averaging

1000 tons daily. When the men begin to come back for the winter the drifts will be pushed on the northern side out into a rich shoot that has been found on the levels above. There are some good stopes being worked on this side and a very few on the Pewabic amygdaloid. Mechanical haulage by means of the system of a rope operated by a compressed air engine of small size will be installed soon on the 29th level as an experiment, but as it is practically the same as used at the Tamarack, Osceola and Allonez, there is not much doubt of its success. At No. 2 shaft the retimbering and the clearing out of the shaft has been carried down about 130 ft. below the concrete collar. This work has been delayed by the lack of men, but it will be pushed as soon as possible to increase the tonnage and reduce costs.

One-half of Calumet & Hecla's leaching plant is working, the other half not being ready. It is running smoothly and fulfilling expectations of C. H. Benedict, the mill metallurgist of the company and all of its subsidiaries. He designed not only this plant but also the two regrinding mills and has materially bettered the milling system of all the subsidiaries. An idea in mining that was tried as an experiment on the conglomerate a year ago, and which proved successful, has been adopted in all the stoping there. There is a small crew of men called riggers who in one shift take down and set up all the drills for the next shift, so that the miner when he comes down to work, having his drill made ready for him, begins at once to drill and does nothing but drilling in his shift.

Michigan has 14 ft. of good copper at the Ogimah lode, which was encountered 180 ft. from the Butler by the crosscut, that is to open up all the lodes of the Knowlton and Evergreen series. It is thought to be 7 ft. in a longitudinal fissure paralleling the lode, then 5 ft. or trap, 7 ft. of amygdaloid with 9 ft., carrying but little of the metal, in the lode itself. The nuggets of copper running as high as 16 lbs. in the fissure and the high grade of amygdaloid abounding in ideal stamp rock on the stock pile elicited the most favorable comment and quite an amount of stock has been purchased from Rocklund, Ontonagon and vicinity in the past week. After the crosscut has been carried farther, on its way to the lodes beyond, enough not to interfere with the drifting the latter will be commenced. The ground on the western side of the shaft on the Butler lode has not been so good for the past fortnight, but now there are marked indications of a favorable change. On the eastern side the drift has been carried up into the parallel longitudinal fissure just over the lode and its rich copper is being followed and then the drift will be bent back into the course of the lode. Work was stopped on the mill at Keweenaw Bay, 15 miles south of Houghton and one mile north of the Mass mill, when it was almost completed in 1907, after \$175,000 had been expended on it; and it will not at the most take over \$15,000 more to complete it. President J. R. Stanton and Superintendent Brady are consulting concerning it now and it is likely that it will be ready as soon as it is needed.

Mayflower is using its diamond drill in testing the ground just north on the Old Colony boundary line and is finding good values. In this property the northwestern part of the lode does not by any means compare with the southwestern part where the values are better and quite uniform. In the Old Colony the ground averages better for the whole extent of the drilled area, and the latest drilled holes, located near the southern line, are equally good if not better than the average. The two directorates seem to be no nearer to an agreement, as regards a consolidation, but it is thought that the disclosures are sufficiently good to warrant the Old Colony to go it alone. It is well known that before any new work can be begun, that additional money will have to be raised either by borrowing or assessment, probably by the latter method.

New Baltic has arranged with S. L. Lawton, the legal representative of the Johnson heirs, through its attorney, A. F. Rees, that the trial of its men for trespass, when about three weeks ago they began breaking ground for the new shaft, will be indefinitely postponed, and a civil suit commenced for determination of the company's rights as to mining operations on the surface. The details have not yet

been arranged but will be announced later. The outcome of this case will be most interesting to our mining men as it will bring to notice new data, perhaps establish a precedent, and make clear some mooted points.

Houghton though getting some copper all the time in the West vein has only found so far one stretch, which was about 20 ft. long, of paying copper, but the vein may prove richer when the drill is shifted to the southern side of the shaft towards the Superior mine. The Superior lode has been entered on the 4th level about 185 ft. from the shaft and in the one cut made so far has found only a little copper, but it will be recalled that the best copper on this vein is nearer the hanging-wall. On the 12th level the good revelations of copper are still appearing at the distance of 80 ft. from the winze.

Winona has very good rock at King Philip No. 1 shaft and at No. 4 Winona. It is hoped later to sink at these two shafts and also at No. 3 Winona. As Lake Superior copper mines average, this mine is very shallow, since No. 3 is only down to the 13th level and in fact is not being worked below the 11th level—No. 4 to the 15th and No. 1 King Philip to the 14th. It would certainly be well to give this mine a thorough test by sinking either No. 4 or No. 1 King Philip down to at least 3000 ft., since there have been quite a number of high grade stretches in the ground already opened. It does seem to the outsider that the Slater leaching process, which has been successfully worked out at this mine experimentally, should be adopted on the scale proposed when copper is high and likely to be so for at least a year.

Hancock, notwithstanding the difficulty in getting new men, is gradually gaining in the amount of stoping being done and is also maintaining the gain in yield from its own shaft, No. 2; it is also maintaining at Quincy No. 7 the high grades encountered there. As soon as the harvest days are past and winter approaches, the men who desire a good, comfortable job during the cold and stormy season will come to the mines. The number of the men, especially trammers, who forsake the mines in the spring for the open air vocations is much larger than would be supposed; of course, when men are plenty this exodus is hardly noticed, but this year it has been very severely felt. This mine was never in so good a condition as it has a great area of ground that is known to be good and that will be mined as soon as the men can be obtained.

Onondaga's diamond drill is now to the depth of 2030 ft. in the formations that should produce the red metal, but so far it has not been found. Prof. A. C. Lane, of Tufts College, formerly state geologist for Michigan, who made a study of this property last year, revisited this year with Superintendent H. W. Fesing, and went thoroughly over the cores taken out since his last visit. The hole that is now being drilled is No. 10 of the series on the northern part of the property. This work, though quite extensive, is not conclusive, as many of our lodes as for instance the Calumet conglomerate extend for 40 to 50 miles, but have only a mile or so materialized; and it is possible that a close geological study of the cores may reveal some favorable indications.

Copper Range is now running all the electric lights and all the machinery at the rock-houses of the three mines, crushers, rock-hammers for clearing off the waste from the masses, etc., except the hoists and compressors with the electricity generated by the turbines actuated by the exhaust steam at the Champion and Baltic mills, with quite a considerable saving and much greater convenience than by the steam engines in each rock-house. The electricity is conveyed 14 miles on a pole and wire system erected by the company; and it includes the Atlantic mine which is owned by this company and which will be reopened up when the surplus and earnings will permit.

Calumet & Hecla's general manager, James MacNaughton, it has been erroneously reported, is going to move to New York. It can be reliably stated, however, that Mr. MacNaughton has taken a house in Boston for the winter, and will divide his time during that season between that city and Calumet. There will be no change in the official staff at the mine, and as General Superintendent John Knox, Jr., will as previously act in Manager MacNaughton's absence.

IRON.

Iron Mountain.

Hoose & Person Co. has shipped its stripping equipment from the Holmes mine on Marquette range to the Munro mine near here. The territory to be stripped is several hundred feet wide and 500 ft. long. The ground has been proven up by a large number of test pits and trenches. The overburden will average from 2 to 20 ft. deep. Hoose & Person has also contracted to mine the ore. It is expected to make a considerable shipment before the close of navigation, the probable output being estimated at 30,000 to 50,000 tons. The ore while of a rather low grade contains ingredients that make it desirable in furnace work. When stripped the property will be in position to make a large production and it is understood, if market conditions warrant the production, the property will send to the docks another year considerably more than 100,000 tons.

Crystal Falls.

Cole & McDonald Exploration Co. has struck manganese ore by drilling. The land on which it is being done is the S. E. $\frac{1}{4}$ of N. E. $\frac{1}{4}$, 29-43-32, and the fee is owned by the Pfister Land Co., of Milwaukee, Wis. In the first hole 28 ft. of surface was penetrated and the drill passed into a body of ore in which the manganese runs to 35.50%. The material yields 27% iron and phosphorus is something over 0.30%. The drill passed through 5 ft. of this material when a broken, gravelly ground was encountered, but a large quantity of "float" of the same nature as that above was found. Whether the 5 ft. of rich material is a huge piece of "float" or an obstruction of ledge in place remains to be proven.

Palmer.

M. A. Hanna Co. has renewed its lease on the Richmond Mine from the Oliver Iron Mining Co. The mine is this season being operated by electric power furnished by the Marquette County Gas & Electric Co. It is an open pit and operated only during the shipping seasons. The mine produces a hard ore averaging 40%. Last season 188,000 tons of ore were shipped. It expects to ship over 200,000 tons this season. The company is cutting for the largest tonnage it has ever produced, but there is a shortage of miners. The number of men now working is 120, and the mine is being operated two shifts. The South Shore railroad has completed a line from the Cascade mine to the Richmond so that both this railroad and the Northwestern can now be used.

The shortage of labor is due to a shortage of houses. Four mines, the Cascade, Richmond, Volunteer and Empire, are operating. If living quarters could be found some 200 more men could easily be employed. To this end the Kirkpatrick interests are contemplating a new town site and Fred Gibbs, engineer at the Cascade mine, is laying out a prospective town site plat.

MISSOURI-KANSAS.

Joplin.

In spite of the better ore prices that prevailed this week, a large number of mines closed down. This movement was a forced one due for the most part to a lack of water for milling purposes. For over two months there has been no rainfall, and those camps whose underground water supply is insufficient for milling purposes have been compelled to await the breaking of the drouth. This has especially affected the West Joplin field, the Prosperity and Duenweg camps.

Theurer & Dixon of Joplin have just completed an 800-ton tailing mill on the Old Bull Frog lease at Smelter Hill. The plant is one of the largest tailing mills ever erected in the district. The jigs consists of 2 rougher jigs, one being a 4-cell 48x48 in. in size, another 5-cell 36x42 in., and a 5-cell feeder jig. In addition to the jigs there will be five sludge tables and complete sizing system. In addition to running the tailings at the old Bull Frog the company is also unwatering the old mine with the intention of operating the

ground once more. An 8-in. Texas pump has been pumping now for some time, and it is expected that the company will be able to start ground work within another fortnight. The Bull Frog at one time was one of the most productive in the Joplin field, and shut down a few years ago when the price of zinc ore reached a low level.

At Central City, J. W. Hardwick and associates have undertaken the draining of a shaft on the Hornaday land. The ground has been developed and shows a rich run of ore at the 65 level in soft ground. A face 8 ft. high has been opened up which is believed will run 10% lead and zinc.

The Gibson mine west of Joplin recently installed larger hoppers and made every effort to increase the capacity of their mill to its maximum. A heavy tram was built connecting the north shaft with the mill, and first motion hoists were installed. The plant is now able to get sufficient ore for operating three shifts.

The P. & J. Mining Co. has started to develop a 10-acre lease adjoining the German-American Silicate Co., about 4 miles southeast of Joplin. The new company expects to open up the same kind of ore deposit now being worked by the German-American Co.

C. Cox, A. J. Poynor, Wm. Gregory and Ashley Williams have opened up a good prospect in a new shaft on the Scotia land southwest of Joplin, the operators struck a rich run of ore at the 60-ft. level in soft ground. The ore occurs as chunk lead and blende, and can be cleaned from hand jigs which are being installed this week.

Webb City.

The Champion Mining Co., consisting of Bert Chism, James Bronson and associates of Joplin is now producing a high grade silicate ore which is assaying around 42% after being milled. The ore is being taken out at the 75-ft. level and sufficient development has now been done to keep the mill running two shifts. The ore is milling out 8% zinc silicate, and the manager asserts that he has now enough ore in sight to keep the mill running all the time.

Duenweg.

On the Carick land northeast of Duenweg on a sub-lease from James Morgan the Woodson Bros. are sinking a new shaft to open up an ore deposit known to exist at the 85-ft. level. The ore which has been developed by drilling is principally lead, although some silicate has been found at the same level, and at a lower level zinc blende is shown.

Amos Freeman has reopened the old Frerer Mine, east of here. This mine made handsome profits for its owners a few months ago when at the 95-ft. level a very large deposit of free lead ore was mined out. Freeman & Co. having taken over the lease did some new prospecting and declare that they have opened up a richer deposit than the one which made the ground famous. The mine has already begun production.

Just across the road from the Frerer mine the One Spot Mining Co., made up principally of Joplin men, have taken over a lease of Josiah Bennett. This lease was drilled out and showed lead ore from 95 to 110 ft. In the prospecting operations drifting has been undertaken at a depth of 100 ft., and so far the ore has been chunk lead, much like the Frerer mine across the road. The company is pushing work energetically and expects to be producing within another fortnight.

Louis and Johnson have entered an old shaft east of the Crown Point Mine and after considerable prospecting believe that they have opened up enough ore to justify the erection of a mill. The ore was encountered at the 140 level and both lead and jack are reported in good quantities. The new mill is now under construction and is designed to handle 150 tons per shift.

been cribbed and filled. Two boilers each of 150-hp. are on the ground, while a third has been ordered. The steam pump is at hand and two electrical pumps have been ordered. The new gallows frame will be 70 ft. high, and constructed of 18-in. timbers. The company has secured the hoisting plant of the old Reins Co. The engine with cylinders of 16x32 ins., is good for a depth of 2000 ft. Sinking of the Calumet shaft from the 1000 level to the 1500 level will start soon. The ledge outcrops 500 ft. east of the Calumet shaft. Shipments have been made from a trench there. The ore returned 3 to 4% copper. It has not been decided whether to crosscut for this ledge from the 1000 level or drive for it from the 1500.

Butte & Superior has again started operations. The mill was started by the night shift Aug. 17 and the day shift at the Black Rock mine went to work on the same date. The accident which caused the shut down was on Aug. 6 and considerable of the shaft-timbering was torn out. As a result operations ceased for nearly 2 weeks.

Butte & London has encountered some promising leads in both the north and south crosscuts. The real veins have not yet been encountered. The north crosscut has been run 175 ft. from the station on the 1600 level and the south crosscut about 225 ft. The Granite gives every evidence of mineralization and small stringers have been encountered. Work will be pushed in both directions. No work is being done at the Rainbow Development property at present, as crosscutting there is completed for the present.

Hilger.

Fergus county has commenced to ship its first copper ore, though gold and silver have been produced for many years. The Sutler mine at the head of Annells creeks has made its first 40-ton shipment of high-grade to the Washoe sampler at Butte. Ore will be hauled from the mine to Hilger and from there will be carried by rail. They now have a 12-ft. face of solid shipping ore and expect to make regular shipments, following this initial lot, sending out from two to three cars a month. It has taken three months to open up the present face. Teaming at present costs \$4 per ton, but it is hoped if the ore runs like the sample lot, \$90, that motor trucks will be used in the future.

Superintendent Gow announces that mining operations on the 2600 level of the Tuolumne will begin this week and, as a result, the production will be increased 25%. The raise between the 2400 and 2600 levels has just been finished, and work is started on the winze that is to be sunk from the 2600 level for the development of the ore below that level. The completion of the raise makes it necessary to put a force of men to work immediately taking out ore on the west level. The assays made there show ore of better grade than on the 2200 and 2400 levels. The mine has been producing about 60 tons per day and, with the additional hoisting to be done from the 2600, this amount will be increased to 75 tons.

The Sinbad shaft on the Butte Main Range property is nearly completed with respect to retimbering and mining on the 500 level will start almost immediately. There are 500 ft. of timbering to be done between the 600 and 700 levels. The work will be finished by Sept. 1, and development of the 700 level will begin. This will consist of crosscutting the entire property on that level to the south line. The crosscut there is now in 400 ft. and there is a distance of 1200 ft. more to be crosscut. This will cut the leads. Orders were sent recently for the new hoist at the Colusa-Leonard Extension property. The management was fortunate in being able to purchase the old Butte-Milwaukee hoist. It is a Nordberg first-motion hoist. It is planned to have it installed for operation by Oct. 1. A new head frame is to be erected and when this equipment is ready sinking will begin. The mine is unwatered now to the 600 level. The pumps have been overhauled and put into good condition.

Maxwell.

The Northwestern Mines Con. mine is sinking a double compartment shaft 8 by 6 ft. at the end of their 700 level, 700 ft. from the portal of the tunnel, and at 40 ft. depth have cut through a vein of copper sulphide ore, 8 ft. wide, carrying values in copper from 6% to 10%, 4.03 ozs. of silver and

MONTANA.

Butte.

Grading is well under way for the shaft houses at the Calumet shaft of the Great Butte Co. and the collar has

a trace of gold. They have shipped 6 cars of concentrates and low-grade ore during July to Anaconda smelter, that netted \$3000. Owing to a cloudburst the Granite County Electric Power Co.'s dam was damaged, necessitating the shutting off of power from the Northwestern Con. mill, the repair to the dam will be finished by Aug. 15, when its mill of 100 tons daily capacity will be running on full time. G. W. Dickinson of Spokane is general manager for the company.

C. F. Spaulding, superintendent Brooklyn mine, states that they cut 4 ft. of shipping ore in an old winze of copper carbonates carrying 60 ozs. silver and 2.6% copper. They shipped the first car of concentrates this week to Anaconda.

NEVADA.

Goldfield.

Streaks of rich ore are showing in the big vein at a depth of 420 ft. in the Kewanas, about 700 ft. north of the main winze. The main ore body lies further to the west, on the shale contact and crosscuts and raises will be driven from the 840 level to open the ore at this point. The ore conditions at the 420-ft. level are considered the most favorable in the history of the mine.

The 1000-ton mill of the Goldfield Con. has been shut down a few days pending the change of treatment from cyanide to flotation. Hereafter all ores will be subjected to flotation and the cyanide plant discontinued. The first 500-ton unit has proven its ability to treat all kinds of mine ore and effect an extraction of 92% gold and 99% copper. The management expects to better the gold recovery as soon as the plant has been in operation a few weeks. High-grade copper-gold ore is being opened on the 600 and deeper levels of the Mohawk and Red Top-Laguna, and considerable work is about to start in other mines composing the group.

At a depth of 530 ft. in the Florence a strong vein has been intersected in the hanging wall of the old Rodgers Syndicate stopes. It averages 4 to 5 ft. wide and assays \$35 per ton in gold, silver and copper. On the 250 and 650 levels large bodies of gold-copper ore are exposed. The flotation plant is now handling upward of 200 tons per day and its capacity is being gradually increased.

Net profits of the Jumbo Extension in July were \$28,400. Mine developments are reported satisfactory, with a large tonnage of medium-grade ore being opened in the north-eastern part of the Velvet claim, at a depth of 770 ft. A series of raises is being extended from the 1017 level of the old shaft to develop the vein to advantage.

Mina.

An examination of the Dunlap property, 12 miles east of Mina, is being made on behalf of S. A. Knapp of Berkeley, Cal., who has taken an option on the mine. The property is owned by the Nevada Copper Co., controlled by officials of the Tonopah Mining Co., and has been extensively developed. The lower adit is in 100 ft. and good ore has been opened by numerous drifts, tunnels and shafts. It is reported the deal involves \$150,000.

Luning.

The Wedge Copper Co. has shipped a 50-ton lot of ore averaging around 8% copper. A 7000-ft. pipe line is under construction from a group of springs to the camp, and considerable equipment is being provided. Three veins are being opened in a monzonite-lime formation. M. H. Welser has been appointed superintendent.

Reno.

The Nixon-Nevada Mining Co. is shipping high-grade ore from its Granite Hill property 14 miles northwest of Reno. Shipments are averaging 10 to 40% copper, with gold and silver also present. It is stated recent shipments have netted the company \$90 to \$100 per ton. The rich ore is coming from No. 1 vein, which ranges from 8 in. to 2 ft. in width. Fred H. Miliken is resident engineer.

National.

The National Mines Co. has arranged to sink the shaft to a depth of 500 ft. below No. 5 level, and will follow this

work by comprehensive deep developments. Good ore has been opened in the tunnel, with the veins showing a persistent tendency.

Good progress is being made with construction of the 20-stamp mill being built at the Buckskin National by the Hatch Leasing Co. Most of the machinery is on the ground and the management expects to start operations in the early fall. A large tonnage of excellent quartz is exposed. N. P. R. Hatch is manager.

Goodsprings.

The Boss mine is shipping gold-platinum ore to an eastern refinery at the rate of \$12,000 per month. The engineers have developed a process for local treatment of the ores, and it is likely a small plant will be built at an early date.

The Bullion mine has been taken over by the Bullion Mining Co., composed of Salt Lake interests, and is maintaining a heavy tonnage of lead and lead-zinc ores. The 60-ton concentrator is operating at full capacity and a hoist is being installed to replace the smaller hoisting engine. Sixty men are employed.

The Christmas Con. Mines Co. has arranged to start building of a 50-ton dry concentrator in September. Shipments are being made at the rate of 200 tons per month.

Seven Troughs.

Thirty days will see the unwatering of the Seven Troughs Coalition mine, which was flooded up to the 1500 level a week ago, according to hydraulic engineers now on the ground. A flow of water was struck last week, while after some exceptionally rich ore below the 1700 level. Within 48 hours the mine was flooded up to the 1500 level. Two special sinking pumps are now installed and rapidly taking out the water. Although disastrous, the flow in the lower levels has dried up the flow on the 1100 level, so that when unwatered, the mine will be kept in working shape with no more pumping than required before the flood. Officials of the company had looked forward to a banner production record in August, but flooding has delayed the rich harvest.

Rochester.

Actual construction of the addition to the Rochester Mines Co.'s mill, in Humboldt County, was commenced this week, and will be rushed to completion. When finished, the improvement will practically double the output of the mill, and bring the daily average up to 200 tons, according to an estimate made by L. A. Friedman, president and general manager. Native silver, in large quantities, is being taken from the bottom of 301, or the Codd, winze, which is now within 130 ft. of connecting with the Friedman tunnel.

Pioche.

Uvada Copper Co., M. M. Johnson, consulting engineer, Salt Lake, is shipping 60 tons per day running 5% copper and 6 to 8 ozs. silver. The ore carries an excess of iron and lime.

NEW MEXICO.

Mogollon.

Socorro Mining & Milling Co. shipped 1700 lbs. of gold and silver bullion to the mint and several tons of concentrates to the smelter from operations covering last half of July.

With good mill ore on the Eberle and also two different locations on the Clifton mine yielding profitable rock, the Oaks Co. is steadily proving the value of the Queen Vein or Mother Lode of the district, in which the management has always had great faith. The Queen is known to carry values for over 10 miles in length and in places to have a width of 50 ft. Its possibilities under extensive and systematic development are good.

The new 3-compartment, 6 by 6-ft. shaft of the Mogollon Mines Co. has reached a depth of 830 ft. Stations and levels are run at regular intervals. This company has started work on a board flume to keep tailings out of creek, the intention being to extend it to present tailings storage

dams on Mineral creek some 4 miles below and permanently keep mill discharge out of streams. The different companies have spent several thousand dollars in recent years and now have the tailings situation well under control.

The companies of Mogollon have completed the survey of the proposed new road to the Arizona line to connect with the route to Clifton and early action on this matter is looked for.

SOUTH DAKOTA.

Rockford.

The main tunnel at the property of the New Golden West Mines Co. is being driven into the hill to tap the main ledge of ore. It has now reached 460 ft. and has just broken through the footwall of the vein. For much of the distance the tunnel has been driven through heavily mineralized slate, all carrying gold values. The main body of ore will be tapped at a depth of 300 ft. and the ore struck will be below the oxidized zone. On surface the ore averages across the 60-ft. vein better than \$4.50 a ton. After the footwall has been broken through a station will be cut and a raise made to surface. From the station a 3-compartment shaft will be started and sunk several hundred feet. Beginning with the first of the month three shifts will be employed. Sinking and raising will be carried on simultaneously.

Lead.

F. W. Bird now has entire control of the Golden Crest mine in the Two Bit district and has a small crew at the property. He plans on opening old stopes and ground only at present. The ultimate plans for development of the ground will be undertaken when sufficient funds are on hand to proceed with the development below the quartzite in the main shaft, now down 300 ft. It is estimated that a capital of at least \$50,000 should be on hand. If successful it would result in opening up vertical veins of quartz ore, lying in the slates. No. 6 shaft down 210 ft. and located east of the main shaft is being retimbered. At several levels in this shaft, considerable quantities of good grade ore were encountered. Some of it was milled in the 10-stamp cyanide plant built in 1902, and the remainder, that of higher grade, was shipped to the Deadwood smelter. There is confidence that much similar ore will be uncovered in the old workings and it is possible that enough will be produced to make advisable starting up the 40-stamp modern cyanide plant, which was completed in every detail, but has never operated.

TEXAS.

Burnet.

The Texas Graphite Co. has a force of about 75 men employed in developing a graphite deposit near here. It is claimed that the deposit is 4000 ft. long, 200 ft. wide and 100 ft. deep, so far as proved, and that indications point to it being larger. Construction of a 200-ton mill, each of the four units being of 50-ton capacity, is now underway. A good amount of the graphite ore has already been moved. It runs from 8 to 12% flake graphite. The milling will be done by the flotation method. The company has already expended a considerable sum of money in erecting residences for its employes and making other preliminary improvements. The milled graphite will be shipped to a refining plant in New Jersey.

Boquillas.

Henry Bordnet and associates are preparing to develop a cinnabar claim which was discovered a few months ago about 30 miles northwest of here. The outcropping is situated some distance from the Terlingua quicksilver district. It is stated that a 20-ton furnace and other equipment will be installed and the new prospect opened on a large scale. Outcroppings of cinnabar are found in many localities of the Big Bend district but up to this time the actual development operations have been confined to Terlingua and the immediate vicinity.

UTAH.

Eureka.

Eagle & Blue Bell has sunk its 2-compartment shaft to the 1875 level and is cutting a station there. An ore body was encountered at the 1832 level and the shaft was sunk further to prove it, but on going down values began to grow smaller. In the progress of this station cutting the past week, when it came to putting in a 15 to 20-ft. sump beneath, again the good values were encountered. This shows a vertical depth of 63 ft. so far on ore. However, the station was so far along that it was decided to finish it up, although the desire was to cut it in the permanent wall formation instead of in this looser material. In a few days the prospecting of the new ore body will be taken up. The ore coming from the shaft discovery ranges from 15 to 40% lead and from 12 to 20 ozs. silver. One lot showed 28% lead and 12 ozs. silver; another 40% lead and 20 ozs. silver, while a third showed values of 15% lead and 15 ozs. silver. It so resembles the ore in the adjacent workings that it is the opinion that it will prove to be an extension. Judging from the water level in adjacent mines, where greater depth has been attained, it is the opinion that this interfering agency will not be met in the Eagle short of the 2060 to 2075 level.

Park City.

Superintendent E. L. Talbot reports conditions at the Daly West as satisfactory with underground conditions better than they have been for a long time. The output for July was bigger than any time since the big fire.

Within the next week it is expected that the work of sinking the shaft at the Keystone will be commenced and work prosecuted with three shifts. It is only a question of getting to the ore, as a large body is known to exist at depth. It is only a matter of a few months at the outside before the Keystone will be in the producing list. For the past 3 months, things have been moving slow at this property because of the nature of the work of putting up new buildings, installing new machinery, stringing electric wires, etc. This work is finished, and now the active work of development will commence.

Superintendent Dave Scott at the Reed's Peak reports conditions favorable. Streaks of iron are coming in the face of the tunnel, and the general impression is that the ore body is near. A meeting of the directors was held at which W. D. Lewis tendered his resignation as president, and Frank Andrews was named as his successor. R. T. Kimball was also named as Lewis' successor on the executive committee with H. Welsh and Mr. Andrews.

At the Daly Judge Extension conditions are satisfactory. The new hoist recently installed is doing good work. The new shaft is down about 90 ft. and in the bottom is some lively looking rock which carries lead and silver values. Three men are at work at the Iowa-Copper-Apex. Development on the incline is opening up a good body of ore. Some 60 tons are on the dump, and the body is increasing in size as depth is obtained.

American Fork.

Ten properties are now active in the district. The Silver Flat, being worked by Clyde Parker and Sam Huggard, is following a lime-quartz contact to get under a showing on the surface. The owners say that there is a cross-fissure running under this depression and they hope to get ore when this point is reached.

The next shipper to be opened up will be the Wasatch Range, on which a deep tunnel is being driven to cut a 3-ft. vein of shipping ore showing near the surface. The men are due to cut this fissure any shot and when it is cut the men who are working under lease say it will be a shipper.

The Alpine-Empire has run its drift 70 ft. into the lime bedding away from the main tunnel, since being taken over by the new management. The ore is improving.

A. Holman and A. E. Holman of Pleasant Grove, H. M. Olmstead and Ernest Woolley of Salt Lake and L. A. Olmstead of Lehi have recently acquired some ground east of the

Milkmaid and have opened a vein of molybdenum which they expect to develop in the near future, as soon as they have perfected the organization of a corporation for this purpose.

H. W. Owens and son are working two properties, one on the North Star and the other one lying to the southwest on the Wasatch range fissure, under the Silver Lake. They are taking out some good rock in the latter property and are expecting to strike a body.

The Stewart-Mercer, under the supervision of Ammon Mercer, continues and the molybdenum strike, reported there 3 weeks ago, continues to improve and a body is being opened up that may soon make a mill profitable.

The Gold Hill, north of Silver Lake and next the Earl Eagle, has 5 men under Theodore Nicholes pushing 2 tunnels into the mountain. No. 1 tunnel is on an east-west fissure in the lime, dipping toward a quartzite contact. It is now in 40 ft. and is showing some silver-lead-copper ore, which is improving with every shift. Tunnel No. 2 is in 30 ft. and is being run to cut the lime quartzite contact that shows good ore on the surface. The property has mineral showings in six different places in four different fissures. The company has a 150-ft. tunnel that will cut these fissures at depth.

Salt Lake.

Grand Gulch Mining Co., managed by W. P. Jennings, Salt Lake, is operating the Grand Gulch copper mine, located in Arizona, on the north side of Grand canyon. It is 80 miles south of St. George, Utah, and 46 miles east of St. Thomas, Nevada, the latter a station on Salt Lake-Los Angeles railroad. The ore, consisting of copper carbonate, is hauled to St. Thomas and shipped to Salt Lake smelters. The shipments, amounting to 300 to 400 tons per month, are of 3 grades: the bulk of it, 11 to 12% copper, a small tonnage running 15 to 17%, and other lots running about 35%. Mining has reached a depth of 300 ft., the ore occurring in limestone and silica, is found in concentric rims around a central core of brecciated material. The Bronzel mine, having similar ore, situated 8 miles south of the Grand Gulch, is shipping 50 tons a month.

WASHINGTON.

Clayton.

The Spokane Belle, idle for 20 years, has again become active. E. H. Belden, Spokane, sole owner, has put 2 men to work cleaning out one of the old shafts and stripping veins. Later, he intends to deepen the main shaft, now down 100 ft., to the 300 level, where a crosscut will be run to tap showings exposed on surface. Samples from the old dumps run as high as 65 ozs. silver. He contemplates forming a syndicate to finance development and later, if conditions justify, a company.

Danville.

The Lucile Dreyfus mine has started to be active again after being idle for 7 years. Arthur Dunphy, Spokane, has bonded the property, the consideration being between \$50,000 and \$60,000. The fixing up of the living quarters and preparations for operations are now in progress. The Lucile is one of the properties on La Fleur mountain, which was the objective point of men who raced from Marcus when the word came that the north half of the Colville Indian reservation had been opened for mineral exploration in 1896.

Northport.

Harry W. Newton has completed plans for the new mill of the Norman Mines Co. and grading will commence immediately. The Traylor fine crusher, four Hartz jigs and a Butchart table have been ordered from Traylor Machinery Co. under a 3-week delivery guarantee. Other equipment, including 50-hp. gasoline engine, belting and other small machinery will be purchased as required in this market. The mill building will be designed to house several more tables, a set of fine rolls and flotation system. The final process will be determined by experiments to be conducted by Newton. Meanwhile the jigging equipment will save approximately 400 lbs. of 30% zinc carbonate from Great Western

mines now unsalable, besides recovering practically all the lead content. It is believed that the south end of the Empire shoot, toward which Great Western tunnel has been extended for some months, has just been entered and a raise is now being put up to determine its extent at that point. Stopping is again under way from below the main level and shipments of zinc carbonate ore will be resumed at once. At the Last Chance three exposures of from 2 to 3 ft. of lead-zinc ore are being developed and about a carload every third day is being forwarded to Ozark Smelting & Mining Co., at Coffeyville, Kansas. Stope fillings and dumps of the Last Chance have been tested and have been found to contain excellent milling material in large quantities. The intermediate dump is being sorted and the hand-picked sulphide ore will be shipped under the Ozark contract. Accommodations for mill crew will be supplied immediately at the terminal tramway.

WISCONSIN-ILLINOIS.

Highland.

The New Jersey Zinc Co. shipped 5 cars of carbonate zinc ore to furnaces at Mineral Point, 120 tons. Webbing Mining Co. sold 100 tons of carbonate zinc ore to a new buyer representing new eastern smelter interests. Great activity prevails in this district of late and demand for at least 100 miners has been announced at three new producers.

Linden.

Shipments last week showed improved conditions, the Linden Zinc Co. shipping 2 cars high grade to LaSalle, 80 tons, and 2 cars to Lanyon Zinc Co., 80 tons. Milwaukee-Linden Development Co. to Cuba, under optional contract with present operators, 5 cars, 200 tons.; Ross Bros. to Mineral Point, 2 cars, 57 tons; Saxe-Pollard Co. to Mineral Point, 2 cars, 74 tons; Optimo No. 2 to Cuba, 2 cars, 86 tons.

Eastern interests exercising option on the Milwaukee-Linden Development Co.'s mines have 7 drills at work proving ground and will supply a magnetic zinc ore separating plant of 60 tons raw ore capacity daily.

Mineral Point.

Forty-four cars of crude zinc ore reached the refining plants of the Mineral Point Zinc Co. last week, 1687 tons. All but 9 cars came from company owned mines. High-grade product to smelter at DePue, 13 cars, 564 tons. Locals delivered small lots to furnaces, 16 tons.

Platteville.

Returns for the entire field for week of Aug. 19 show delivery of 166 cars of ore to track, 6893 tons. This record has been exceeded but once and by one car only. One car of lead ore cleared 76,000 lbs. Shipments of pyrites came from the National Separators, 706,400 lbs.; Mineral Point refineries, 673,900 lbs. The gross recovery of raw ore from mines for the week totaled 5057 tons, a record-breaking output. Net deliveries to smelter, 3004 tons, also high.

Klar-Piquette and East End mines each shipped 3 cars raw ore to Galena. Hodge mine of the Vinegar Hill string, 3 cars to Cuba. A considerable quantity of both high-grade separator ore and crude concentrate was carried over.

Prices held stationary, the base on standard and top grades holding at \$56 per ton down to \$50 base for medium grades. One outstanding feature of this week's business is exceptionally heavy buying by the Eagle Picher Lead Co. from the Wisconsin Zinc Co., 750 tons being bid in for prompt delivery.

Miffin.

Shipments last week were practically nil, nearly all independent operating concerns failing to report. The Coker mines of the New Jersey string shipped 9 cars to Mineral Point, 355 tons.

Established and operating for 30 years or more, the Coker mine is today regarded one of the greatest single zinc ore producers in the entire field. Six hundred tons of mill-rock are handled on double shift, one 30 to 40-ton car of ore being loaded and shipped daily. Grunow Mining Co. is engaged in ore production, making 8 tons daily on single shift.

Drills are engaged for the company on the Clayton farm. Peacock Mining Co. is operating with newly installed Lawson aerial-tram. Rapid ore handling has been facilitated. Drills continue on the lease, but without any marked result. Royal Mining Co., operating the Peni lease, continues operation, making 58% wet concentrate, the best raw ore of the field. The mine has been carried into the old Grunow lease on the Miller farm. Lucky Six Mining Co. is making 14 tons of 48 to 54% zinc ore daily on single shift. A crosscut is being driven to the body struck in drilling. Exploration work with drills on the lease of late has been rewarded with rich strikes. The B. M. & B. Mining Co., operating the Squirrel mine, is driving a big crosscut toward a range newly drilled out ahead of the Lucky Six mine. Drills are employed in drilling out the property and a new shaft is being sunk on the Squirrel range. Flat sheet formations of zinc ore 6 ins. solid have been stripped. The Biddick mine is making 20 tons of 30% zinc ore daily on single shift. Drills are engaged west of the main range. Superintendent Hempfield has been placed in charge of the Big Tom mine and equipment. Extension of the main transmission line of the Mineral Point Electric Power Co. to Livingston now insures power for the Big Tom, where a new 200-ton plant is not quite ready to begin service. Vinegar Hill Co. is removing the Rundell plant to the Yewdall strikes. Drills are at work on the Yewdall lease.

Cuba City.

Receipts of raw ore for last week at National Separators totaled 20 cars, 856 tons. High-grade finished blende to Illinois Zinc Co., 39 tons; to Granby Con., 8 cars, 323 tons; Utt-Thorne Mining Co. to Benton Roasters, 4 cars, 176 tons.

Benton.

All previous records for a single week's delivery of ore to track were exceeded last week with a turnin of 73 cars, 6,224,000 lbs. The Grand View Mining Co., a new incorporation, reported its initial shipment, 2 cars to Cuba, 53 tons. Other new shippers were the Wilkinson, 2 cars to Cuba, 83 tons; Sally Mining Co. to Cuba, 1 car, 28 tons; the Frontier string shipped 11 cars, 465 tons; New Jersey Zinc Co. .15 cars, 621 tons; Vinegar Hill string, 8 cars, 369 tons; Wisconsin Zinc Co., from Skinner Magnetic Separating plant to Grasselli Chemical Co., 41 tons; American Zinc Co., 6 cars, 260 tons; Lanyon Zinc Co., 3 cars, 130 tons; Eagle Picher Lead Co., 4 cars, 180 tons; Champion mine to Wisconsin Zinc Roasters at Galena, 12 cars, 570 tons; Fields Mining & Milling Co. to Galena Refining Co., 5 cars, 205 tons; Longhenry Mining Co. to Cuba, 39 tons; Indian Mound to Mineral Point, 46 tons; Benton Roaster Co., high-grade to LaSalle, 44 tons. More new producers are rapidly nearing the shipping stage and it is claimed by experts familiar with the situation in this district that in another 60 days the camp will be able to lay on track 100 cars of crude zinc ore weekly.

Shullsburg.

The Winskill mine maintains its reputation as a splendid zinc ore producer, last week sending 7 cars to refineries at Galena, 286 tons; Rodhams Mining Co. to Lanyon Zinc Co., 1 car, 41 tons.

Galena.

Twenty-five cars of ore to track last week is merely a forerunner of what is coming in this district following a protracted period of mine exploitation and development. Shippers were Black-Jack mine to Mineral Point, 5 cars, 196 tons; North Unity to Cuba, 4 cars, 183 tons; Galena Refinery Co. to LaSalle, 1 car, 40 tons; to Lanyon Zinc Co., 6 cars, 258 tons; Wisconsin Zinc Co. refinery to LaSalle, 4 cars, 160 tons; to Edgar Zinc Co., 3 cars, 120 tons. The Birkbeck mine, with hran new rig, reported its initial shipment to refinery, 1 car, 44 tons; Federal mine to Wisconsin Zinc Co., 1 car, 40 tons. Little Corporal, Graham, and others, all with new equipment, are producing and ready to report zinc ore shipments.

Potosi.

The Tiffany Zinc Co. has been rewarded with rich zinc ore discoveries through drifting. The main drift is 32 ft. high and 110 ft. wide. Crosscuts have been completed for 250 ft. on the main deposit. Underground development was suspended on Aug. 19 and all attention is now being given

to the construction of a 200-ton power and milling plant. Ore assays made recently show a recovery by wet concentration alone of 58% zinc content. W. N. Tiffany of Platteville is in active charge of the entire project, which is being financed by Chicago Board of Trade operators.

The Chicago Zinc Co., a new mining corporation, has control of 800 acres of mineral lands in this region, with option covering the fee. The total capitalization has been placed at \$250,000; the sum of \$25,000 has been set aside for prospect and development work. Two new Keystone drills are prospecting the ranges.

The Wilson Mining Co. has completed drift to forehead 20 ft. high and 80 ft. wide and is now in shape to secure consistent output. Superintendent A. G. Grannis, in charge the past 2 years, has been succeeded by Superintendent Fox from the Benton district.

Hazel Green.

The Kennedy mine continues shipments, 2 cars going to Mineral Point last week, 80 tons; Monmouth Zinc Mining Co. to Galena, 2 cars, 53 tons; Lawrence mine to Galena, 3 cars, 123 tons.

WYOMING.

Lander.

On Aug. 15 the Wyoming Petroleum Co. brought in another light oil well at its lease on the reservation 9 miles north of Lander. The Hall Oil Co. also brought in a well in the first sand in the Pilot district. As yet the second sand formation has not been touched though many companies are drilling for it at present.

M. Morgan, H. W. McIntyre and W. D. Clair, representing a London and New York syndicate, have purchased 60,000 acres of oil land. The tract lies in what is known as the Rattlesnake and Dutton basins between Casper and Lander. The Wyoming & Northern railway parallels the land for 12 miles. The tract was sold by J. Evray, National City, Cal., and George S. Smith, Casper, Wyo., for \$5,000,000, the largest price ever paid for a single tract of oil land in Wyoming. The purchasers said they have drilled 400 test holes in the land and oil was struck at each hole at depths ranging from 300 to 1000 ft.

Upton.

A new oil district has been inaugurated near here and is known as the Thirnton district. To date little is known of the field. The deepest well has reached a depth of 1200 ft., but has not been shot. The well is in a characteristic oil sand from which has been pumped a quantity of the product, said to be decidedly high grade. Samples tested have shown 60%. Those interested are awaiting the shooting of the 1200-ft. well and the result will have much to do with the immediate future of the district.

CANADA.

BRITISH COLUMBIA.

Grand Forks.

The Seattle and Loyal Canadian mineral groups, 8 miles north of here have been bonded for \$125,000 by Robert Clark and associates to interests backed by E. E. Martin, San Francisco. The property is one of which little has been heard for more than a decade, though considerable money was expended in development work some 15 years ago and a small tonnage shipped. It is located close to the track of the Kettle Valley railway on the North Fork. The bond calls for shipment of 50 tons of ore daily. The owners are to receive a royalty of 50 cts. a ton. This will be applied on the purchase price. A payment of \$5000 is to be made in 6 months, \$10,000 in 12 months, and the balance in 2 years. Eight men are at work on the property, which is in charge of John McKay. Shipments are being made from surface ore three times a week. Arrangements are under way for the installing of a 5-drill compressor plant in October, and

then the force will be increased to 30. The ore will be shipped to Granby, arrangements having been made with the Kettle Valley railway for service.

Kaslo.

A strike has been made on the St. Patrick group by J. J. Brochier. The claims are located north of Argenta on the Hammill Creek road. The ledge is 30 ft. wide and well mineralized all the way. It contains a shoot from 28 to 40 ins. wide, of good concentrating ore, with a streak of solid galena 8 ins. wide in the middle. The property has been inspected in the last few days by F. R. Wolffe, president of the Florence Co. at Ainsworth. He has spent \$2000 on the property without including his own time and labor.

Trail.

Ore received by the Canadian Con. Co. at its smelter here for the week ended Aug. 15 totaled 10,888 tons, as compared with 10,111 tons during the preceding week, making the aggregate for the year to date 307,077 tons. Notable among the receipts for the week were large tonnages from the United Copper and Electric Point mines, and an initial shipment of 4 tons from the Deer Trail mine in Cedar canyon, Stevens county. A curiosity of the returns is a shipment of 1 ton from the Reco mine at Sandon, an old producer of high-grade silver ore. Mines having a special interest to Spokane, with the tonnage of their shipment last week and for the month of August so far, are as follows:

	Week.	Half month.
Slocan Star, Sandon.....	85	201
Wonderful, Sandon.....	41	41
Rambler-Cariboo, Slocan.....	75	75
Galena Farm, Silverton.....	44	88
Standard, Silverton.....	75	515
Utica, Kaslo.....	49	94
Keystone, Bayview, Idaho.....	36	36
Deer Trail, Davenport.....	4	4
Columbia-Turk, Davenport.....	22	22
United Copper, Chewelah.....	313	494
Knob Hill, Republic.....	30	30
Electric Point, Boundary.....	421	609
Florence, Ainsworth.....	81	81

The following table gives the names and locations of the mines which delivered ore during the second week of August:

	Week.	Year.
Center Star, Rossland.....	3,914	117,091
Le Roi, Rossland.....	1,697	82,820
Le Roi No. 2, Rossland.....	459	10,139
Sullivan, East Kootenay.....	2,876	45,001
Slocan Star, Sandon.....	85	4,734
No. 1, Sandon.....	29	55
Ruth, Sandon.....	68	562
Reco, Sandon.....	1	71

Highland, Ainsworth.....	78	1,394
Florence, Ainsworth.....	81	778
Other mines.....	24,597
Totals.....	10,888	307,077

ONTARIO.

Cobalt.

Larose Con. has discontinued work in the tunnel under the bluff on the Larose Extension claim, which adjoins the original Larose. The tunnel was started last winter. The work could be done cheaply, but the results have not proved encouraging. Ore from the dump is still going to the Northern Customs and operations are being continued in the old workings of the original property.

Developments are most promising for the opening up of an entirely new mine at the McKinley-Darragh. The management has always believed, previous to about a year ago, that when the veins were worked through the conglomerate to keewatin, that further research in keewatin, or along the contact would be a waste of money. Research work undertaken about a year ago, demonstrated possibilities and since that time exploration has been pushed along fault lines to

the north and east. Quite recently a crosscut from the winze at 400 ft., before the conglomerate was struck, picked up a vein in the Keewatin—barren, as is usually the case. Immediately the face of the drift entered the conglomerate the character of the vein changed and within a few rounds there was silver showing. This development is the more promising since the vein was discovered by a system of working out various faults in this part of the ground, at exactly the point where it was expected. There is, therefore, no reason to believe that the extensions of further ore bodies worked in the upper levels of the conglomerate should not be discovered in this section of the ground to the north and east of the present workings. The Savage mine is still shipping, but the supply is running short and unless more discoveries are made this auxiliary of the McKinley-Darragh-Savage will have to be closed down.

The Temiskaming main shaft should be down to the contact between the bottom of the diabase sill and the keewatin by the end of the year. The shaft was started some time after that of the Beaver. The delay in sinking of the former was on account of the time required to install the new Nordberg hoist. The Temiskaming shaft is now down 1250 ft. Between 350 and 400 ft. of additional sinking is still required to reach the contact. The company is in a strong financial condition, with a surplus of \$170,210.02 in cash on hand.

Timmins.

The first monthly report of the Hollinger Con. for the month ended July 14 shows the gross profits for the month to be \$215,165.16. The total quantity of ore hoisted was 46,018 tons and the greatest depth from which ore was hoisted was the 1250 level. Only 83 tons came from that level and 20 tons from the 1100 level. The greatest tonnage from development came from the 425 level, from which point 3414 tons were hoisted. In ore taken from stopes the greatest tonnage came from the 200 level, from which depth 16,750 tons were hoisted. No ore from stopes came from below the 550 level. Including 1849 tons of rock hoisted in development a total of 47,867 tons were hoisted during the period. The mill ran 93.8% of the possible time, and the average value of the ore treated was \$9.15 per ton, the milling costs were \$0.969 per ton and the total working costs, \$3.990 per ton of rock milled. From the above figures it is seen that the ore treated for this last period is higher than the average for the first 6 months of the year. During the 6 months the average grade of ore treated was \$8.80 per ton, against \$9.15 for the period between June 16 and July 14. The costs for the 24 weeks, however, were lower, averaging \$3.36, against \$3.74 for the last period.

MEXICO.

Monterey.

In the Concepcion del Oro, the Cerralvo and a number of other mining districts of this part of the country foreign-owned properties are again being operated after a shut-down of several weeks on account of the acute situation that existed between Mexico and the United States. In some instances these mines are still in charge of trustworthy Mexican employes who were left behind to look after and protect them to the best of their ability.

The Minerale & Metales Co., which owns extensive mines at Guadalupe, about 50 miles north of here, recently resumed operations on a larger scale than at any time since the revolution. It is owned by Germans. Recently large shipments of machinery for the mines and smelter of the company were brought in and the development work is to be further enlarged. The company has also imported steel rails and other material for building a spur track from its mines to a connection with the Monterey-Laredo division of the National Railways of Mexico.

It is reported here that the A. S. & R. Co. will make another effort to operate its plants at Chihuahua, Monterey, Asarco and Aguas Calientes as soon as the necessary supplies of coke for fuel can be obtained. Comparatively few Americans have returned to the Guanajuato mining district.

World's Index of Current Literature

A Weekly Classified Index to Current Periodical and other Literature, Appearing the World Over Relative to Mining, Mining Engineering, Metallurgy and Related Industries, in Four Parts.

Part 1. *Geology*—(a) Geology; (b) Ore Genesis; (c) Mineralogy.

Part 2. *Ores and Metals*—(a) Metals and Metal Ores; (b) Non-Metals.

Part 3. *Technology*—(a) Mines and Mining; (b) Mill and Milling; (c) Chemistry and Assaying; (d) Metallurgy; (e) Power and Machinery.

Part 4. *General Miscellany* (including Testing, Metallurgy, Waste, Law, Legislation, Taxation, Conservation, Government Ownership, History, Mining Schools and Societies, Financial, etc).

Articles mentioned will be supplied to subscribers of *Mining and Engineering World* and others at the prices quoted. Two-cent stamps will be received for amounts under

\$1. Subscribers will be allowed a discount of 5 cts. if the price of the article exceeds 50 cts. The entries show:

(1) The author of the article.

(2) A dash if the name is not apparent.

(3) The title, in italics, of the article or book. Titles in foreign languages are ordinarily followed by a translation or explanation in English.

(4) When the original title is insufficient a brief amplification is added. This addition is in brackets.

(5) The journal in which the article appeared; also the date of issue, and the page on which the article begins.

(6) Number of pages. Illustrated articles are indicated by an asterisk (*).

(7) The price.

September.....	48.68
October.....	49.385
November.....	51.713
December.....	55.038
Year.....	49.690

Difference in domestic and foreign prices explained by the fact that the New York quotations are per fine ounce; the London per standard ounce 8.925 fine.

Copper.—The boom on copper is on. Demand continues to gain in volume each day. Prices are advancing. Nearby metal is scarce and commands a premium. Consumers, both domestic and foreign, are pressing the covering of their requirements. The market situation is taking up the threads that were dropped last May and new records in sales, prices and production are looked for over the winter months. Demand for copper from domestic users is tremendous. Last week sales of over 75,000,000 lbs. for delivery in November and December were reported by leading interests in addition to sales of about 25,000,000 lbs. for export and domestic account for delivery in the first quarter of 1917. Spot electrolytic cannot be had at 28 cts. Consumers reported a few small lots available at 28¼ cts., but any sizeable amount would bring 28½ cts. October electrolytic also commands a premium, while for November and December the latest sales have been made at 27 cts. Thus current prices are 2 to 3 cts. a pound over those prevailing 5 weeks ago. Electrolytic for the first quarter of 1917 has been sold at 26¼@26½ cts., and with the rapidity with which production for the rest of this year is being absorbed, indications are that 1917 copper will soon prevail above 27 cts. Casting copper has felt the impetus, with spot now holding firm and in demand at 25¾ cts. and fourth quarter held at 25 cts. Ordinary lake copper for prompt delivery sold at 27¼ cts. cash, while prime lake for the fourth quarter sold at 27 cts.

Improvement in sentiment is general. Interests usually pessimistic now concede the strength of the red metal. Consumers indicate by their anxiety to cover that prices are again bound higher. The attention being given to refining capacity illustrates the fear of insufficient production. As has been pointed out, refining capacity has not increased in proportion to the expanding demand. New capacity is delayed in completion and while production of ore is mounting the actual outturn of copper does not run above 165,000,000 lbs. a month. Belligerents in their forward purchases are realizing that copper will be needed even after the termination of the war and the new contracts provide for full delivery without regard to the duration of hostilities. Thus the copper situation is gradually shaping for at least 2 years of activity and high prices. On this basis little concern is now expressed over inflation of output.

While domestic consumption of copper is at its highest pitch it has been demonstrated that foreign absorption is

still to reach its apex. Compilation of the production of the 20 leading producers of copper in the first 6 months of this year show an output of 895,000,000 lbs., an increase of almost 300,000,000 lbs. over the production in the first half of 1915. Thus 20 producers turned out on an average 125,000,000 lbs. ore a month, so that the estimates of a total monthly ore output of 200,000,000 lbs. are not amiss.

The large foreign inquiry has not culminated into business as yet, but the matter is active and may be closed before the end of this month. This purchase involves 125,000 tons, and is sufficient in itself to compel buying of copper well into next year. Some good sized foreign orders for delivery this year have been cabled here, but the bulk of the business taken recently has been from domestic users. Prices on wire goods and copper sheets have moved upwards in response to the activity in the primary markets, and manufacturers report that consumers who were waiting for a reaction are now placing their orders. A survey indicates that the future of copper is no longer dependent on the war. The market has been established on a basis where the difference between intrinsic worth and actual values are no longer an item of contention.

At London the situation in standard copper has been a paradox. This grade of copper has been steadily receding, while American electrolytic has advanced. As the Ministry of Munitions forbids the purchase of copper at prices higher than those quoted on the London Metal Exchange, except by special permission, it is evident that users are supporting the upward movement in electrolytic. Last week standard declined £3 in spot and futures, while electrolytic advanced £2. At the opening of the current week standard receded £2 in spot and £1 10s in futures, with another gain of £1 in electrolytic. It is therefore manifest that electrolytic copper is acting independent of the standard market.

Quotations for copper per pound at New York for the week ended Aug. 23 were as follows:

Tin.—The market last week was affected by declines in tin at London and Singapore. Trading which at first was active fell off and prices began to recede in sympathy with the weakness abroad. Spot and futures dropped a full cent during the week. Users who previously had shown a disposition to cover forward needs naturally withdrew on the weaker market. Large sellers were at a loss to explain the recessions abroad, especially in view of the high prices cabled with the limits from the east and also from London.

The spot situation here shows no change. Holders are carrying fair stocks, but are not offering, as they hope to recoup. Spot Straits tin is quoted at 38½ cts., while spot Banka is held at 37¼ cts. A few lots of impure Chinese tin were sold at 36¾ cts. There still appears to be a strong belief that tin will increase in value. Expectations are that Singapore operators will ship less freely. On the other hand, as long as the war continues, tin will be affected, as both Germany and Austria, both large consumers, are out of the world market.

At this writing Straits tin for September and October delivery is held at 38¼@38½ cts., while for November and December 38@38¾ cts. is quoted. This indicates the relative strength of futures despite the heaviness of the spot position, as the difference between spot and December is only ½ ct. Arrivals of tin since the first of the month total 3137 tons, and indications are that August imports at both coasts will total about 4000 tons. The stock afloat to this country totals 3085 tons.

Foreign markets closed at the lowest point last week, but at the opening of the current week London came steadier, while Singapore on Tuesday advanced £1 5s to £172.

Quotations for tin per pound at New York and per ton at London and Singapore for the week ended Aug. 23 were as follows:

Aug.	New York		London.	Singapore,
	Spot.	Sept.

Lead.—This metal is now in the midst of a movement the like of which has not been seen in many months. Last week the A. S. & R. Co. announced two advances of \$5 a ton each, but each time independents topped the advance by

\$2 to \$3 a ton. Business has been very active. Canadian interests have bought heavily and are still in the market. Russia and Japan were also active buyers, while domestic users took freely of spot metal and sought futures, but sellers were shy on forward business. When the A. S. & R. Co. brought its price up to 6.25 cts. independents advanced to 6.50 cts., and when the principal producer brought its price up to 6.50 cts. independents took orders at 6.65 cts. New York. On Monday independents took orders at 6.65 cts. St. Louis and 6.75 cts in New York.

The influx of lead business did not arise from shell contracts, as no contracts for shrapnel were placed, all the shells being explosive rather than shrapnel. Some orders for September and October were taken at 6.65 cts. New York basis by independents, who reported that they could sell several thousand tons at this price, but did not care to dispose of the metal, as indications point to 7 cts. for lead in the near future. Canadian buyers took 2000 tons spot metal last week and were in the market for 1000 tons on Monday of this week. Sales of about 1500 tons were made to domestic users by independents, while Asiatic interests took about 700 tons. At London the market has been steady, with a fair upward movement.

Quotations for lead per pound at New York and per ton at London for the week ended Aug. 23 were as follows:

Aug.	New York		London	
	Indpts.	A. S. & R. Co.	Spot.	Futures.

Lead Ore.—In the Missouri-Kansas-Oklahoma district during the week ended Aug. 19 production was increased some because of signs in the pig metal market denoting more strength in price in the near future. Production during the week totaled 1,645,940 lbs. and the year's production totaled 67,262,112 lbs. Values given for these amounts were \$53,271 and \$2,885,899. Even though prices remained at \$65 and \$67 for 80% concentrates, as during the previous week, general conditions and buying were noted as being better.

Zinc Ore.—With the condition of the spelter market changing for the better prices of ores in the Missouri-Kansas-Oklahoma district during the week ended Aug. 19 were up \$5 and the top prices obtained for ores was \$70 and this ranged down to \$50 for the less desirable grades. There were produced 8,127,290 lbs. of concentrates, bringing the total for the year to date at 424,842,454 lbs. Values placed on these amounts were \$245,256 and \$19,287,867.

Calamine.—Little change was noted and the ores sold from \$35 to \$45, as during the previous week. Concentrates

produced during the week were 529,890 lbs. and the total for the year to date was 19,984,610 lbs.

Spelter.—Although business has not been so brisk, prices have continued to advance, with the market very strong and sellers limiting transactions in futures. Some domestic users were fair buyers, while some export business also came to the surface. There is a very active demand for forward metal, while spot is somewhat scarce, but consumers are generally well covered over September. The sharp advances in copper have furnished additional strength to spelter, as brass makers in taking forward copper have endeavored to cover their needs of zinc. Spot has advanced to 9¼ cts. New York and 9½ cts. St. Louis. The price at St. Louis reflects the scarcity of spot at that point, as usually the difference is a quarter of a cent. For September delivery business was done at 9½ cts. St. Louis, with sellers also asking the same price for October. For November delivery some orders were taken at 9¼ cts., while the quotation for December is 9½ cts. At London the market has been steady, with prices advancing £5 in spot and futures last week, while at the opening of the current week prices advanced £1, sending spot up to £55 and futures to £49. A good business was done in special grades. Brass special advanced to 10¼@10½ cts.

Quotations for spelter per pound at New York and per ton at London for the week ended Aug. 23 were as follows:

Aug. 17	New York.		London.

MISCELLANEOUS METALS.

Antimony.—Demand for antimony developed with a rush last week. Large sellers reported sales running over 2000 tons. Prices which had dropped to 9½ cts. advanced up to 15 cts., making a jump of 4 cts. in one day. Large consumers took round lots of spot, but buying of futures was small. The influx of business cleaned up the accumulated spot supplies and the situation is once more favorable for the metal. At present sellers are quoting spot at 13½ cts., with demand less active, but prospects are for an early resumption of demand. The leading Chinese interests secured the bulk of the recent business by reason of their holdings of spot metal.

Quicksilver.—The situation in this metal is unchanged.

Sellers are asking \$75 a flask for spot virgin, but demand is only fair, and with large supplies coming overland and also from Europe, indications are that the price will recede. Powder makers are no longer in the market and with increased production facing only an ordinary absorption it is manifest that sellers will soon be forced to lower quotations.

Spiegeleisen.—Some export business has developed in this alloy, about 2000 tons being sold to European consumers. A domestic user was in the market for about 2000 tons for delivery in the fourth quarter. The market is steady, with prices unchanged at \$45@50 furnace for 20%.

Mines and Mining Operations at Ely, Nevada

A. G. HILLEN.

An inspection of the mines and mining operations, the mills and smelters of the Robinson mining district, of which Ely is the center, presents a most interesting and inspiring view. Whether considered at the mines, in the mills, or at the smelters at McGill, the effect produced is that efficiency, smooth running and good management prevail.

The Nevada Con. Copper Co. is moving and reducing better than 10,000 tons per day. This volume or tonnage of ore is transported from the mines at Ruth each 24 hours a distance of 25 miles to the mills at McGill in trains of 20 to 24 cars each, and the average is a train of 50-ton cars every two hours.

A daily production of 2000 tons of this ore comes from the Ruth mine shaft daily, the balance is mined by steam shovel from the great open-cuts or pits. To accomplish this great task, an immense plant, an army of operatives and tremendous mechanical forces are employed. The result is approximately 250 tons of copper matte, running well in silver and gold, as the daily production of the Nevada Con. Co.

Following the ore as it is mined and loaded in the 50-ton cars, across the 25 miles of hill and valley to the crushers, where it is automatically and mechanically unloaded, mechanically fed from the ore bins to the hoppers, from hoppers to crushers, from crushers to Huntington mills, and after grinding, to the immense batteries of concentrator tables, which number over 1100, where coarse concentration is effected, the pulp is conveyed by mechanically-driven conveyors to rolls and re-ground for further reduction in 12 batteries comprising 470 Frue vanner tables. By gravity launders and pumping, the solution is conveyed to the settling tanks, the pulp material segregated by draining off the solutions, dried and loaded into cars by other mechanical devices and transferred to the huge McDougall reverberatory roasters, a quarter mile from the mill. After preliminary roasting, it is conveyed by car and tram to the converters, which produce the red metal in matte form, weighing about 400 lbs. each.

This briefly, is an account of the transformation or transmutation of the ore and its copper, gold and silver content from the immense mountain area of

porphyry, containing 1½, 2 or 3% copper in the porphyry mass. To all intents the operation would appear continuous and complete, though the processes are perhaps technically complex and require deep scientific demonstration. For instance, the addition of a little oil sprayed in the roasters at just the right time, where the sulphur content of the ore does not complete the roasting, the dumping of quantities of lime in the converters, appears simple enough, but produces a condition that permits pouring the copper at just the right heat, at the right moment, and secures first, the oxidation of the ore completely, and later by the addition of the lime, produces complete combustion of the iron content of the roasted ore and evolves the complete processes of smelting and reduction essential to a high saving of the copper.

Necessary to the operation of the mines and mills of the Nevada Con. Copper Co. and its immense reduction plant, reducing upwards of 3,000,000 tons of ore per annum, are first the immense power plant consisting of one 2500 k.w. Westinghouse turbo-generator, two 15-kw. engine-driven generators, Nordberg engines and Allis-Chalmers generator, two 800 kw. Allis-Chalmers generators driven by Allis-Chalmers engines, one 1500 cu. ft. and one 18,000 cu. ft. Nordberg blowing engines for the copper converters, one 8000 cu. ft. Allis-Chalmers engine, one 20,000 cu. ft. General Electric turbo blower. In addition, a 300 cu. ft. Connorsville blower connected to tandem compound engine, a 1000 cu. ft. Laidlaw-Dunn-Gordon steam-driven air compressor, all these units being supplied with steam at 160 lbs. gauge pressure 100° super-heat, and are uncondensing and connected with surface condenser. Approximately 40% of steam is derived from waste heat boilers and reverberating furnaces; the balance of the steam is derived from coal-fire boilers in power house, a building about 400 by 180 ft., with concrete base.

There is a steam-driven Nordberg pumping engine at the concentrator plant with capacity of 12 second-feet, supplied with steam from power house. This engine is for handling return water from the mill. Approximately 15,000 hp. is used.

Utilizing waste heat at the reverberatories are

BUCYRUS SHOVEL IN OPERATION AT THE NEVADA CON. PROPERTY.

W. H. H. H. H.

eight 400-hp. Sterling boilers, and two 400-hp. B. & W. boilers. This steam is super-heated in separately fired Foster super-heater, located in the power house boiler room. In this room are eight 400-hp. Babcock & Wilcox boilers and two 600-hp. Sterling boilers. These are fired and equipped with Green and Sturtevant economizers. There are four Goubert feed-water heaters. The boiler-feed pumps are of the steam turbine-driven type, and 3-stage centrifugal, with Terry turbines and Jeanesville pumps. The draft is furnished by five Sturtevant induced draft fans direct-connected to Sturtevant engines. The circulat-

from Duck creek, in a valley comprising about 100 sq. miles of arable valley land, 12 miles east of the range of mountains close to the plant, and is brought in by a 32-in., wood-stave pipe line 10 miles in length, with gravity flow. This is supplemented by two 5 second-feet De Laval centrifugal pumps, motor driven, which pump water from a large spring below the smelter. These pumps work against a head of 460 ft. Due to the isolated location of the plant, extensive machine shops are maintained with modern foundry. The average output of the foundry is about 130 tons per month. All structural steel work required for the

CLASSIFIERS IN STEPTOE MILL, MCGILL, NEVADA.

ing water for the condensers is furnished from Duck creek, and after passing through power house condensers flows by gravity to the mill, thus eliminating circulating pumps or cooling towers. The make-up water for the boilers is taken from outside the circulating line and passes through a mechanical filter and a water softener, both built by the Kennecott Co. The electric current is generated to 600 voltage, and is used at this voltage in shops and smelters. The electric current going to the mill is stepped-up to 14,000 volts and the current going to the mines is stepped-up to 40,000 volts. The mill transmission line is 3000 ft. long and the transmission to the mine is 25 miles long, at both places the current is stepped down to 600 volts before being used. The water supply is furnished

plant is fabricated at McGill. The estimated cost of the entire plant is \$4,000,000.

In charge of this immense plant of power and mechanical machinery is Lindsay Duncan, mechanical engineer and former professor at Cornell University.

A new crusher plant is being added to the big mill of the Nevada Con. Co., and new furnaces installed. It is expected that by January 1 these new additions will be complete and in operation, when the daily tonnage of ore will be increased to about 15,000 tons.

The Hidden Treasure Co.

Owns four claims, 63 acres, northeast of Ely, near the Ruth mine, and covers about 3500 ft. of the porphyry and porphyry-lime area. The property has pro-

duced a rich copper and silver-lead ore of shipping grade. A shaft in the porphyry shows copper ore at 50 ft. At 100 ft. appreciable enrichment appears and assays running as high as \$14 gold, 47 oz. silver, and 42% lead were obtained. A tunnel driven 400 ft. to tap a silver-lead vein is still 200 ft. from the lime contact. There are quartz croppings on this claim showing stringers and bunches of high-grade copper ore, with gold and silver values, and much iron capping, the usual indication in the district of copper ore bodies. On the north end of the Ontario claim, owned by this company, are rich bodies of silver-lead ore, consider-

erly and with a strike about north 30°. The property lays 2 miles east of Ruth and about the same distance from the Nevada Northern railroad.

Mr. Paine also owns three claims near Lane city, 2 miles west from Ely, which show valuable deposits of silver-lead ore partially developed.

The Argus Mines.

At the old camp of Taylor, White Pine county, situated 18 miles southeast of Ely, is located the property of the Argus Mines Co., of which H. G. McCulloch of Ely is manager. This camp was a producer

LOWER CONCENTRATING FLOOR, STEPTOE MILL, MCGILL, NEVADA.

able of which has been extracted from surface workings in past years, but which now require further development. The Hidden Treasure Co. is controlled by D. C. McDonald and associates of Ely.

The Hayes Mine.

Consisting of a patented claim, 200 by 1000 ft., adjoining the Ruth of the Consolidated, and owned by D. F. Paine of East Ely, and is preparing to ship. The Hayes is working in a body of copper-lead-silver ore in a tunnel being run to tap workings above, which show bodies of silver-lead and gold and silver ore and from 4 to 5 ft. of zinc carbonate ore that will run 30% or better. The ore lays in pipes and shoots between strata of lime about 20 ft. in thickness, pitching east-

of silver-gold ore in the 80s, most of which was taken from a bedded deposit and milled at Argus Lake on Steptoe creek, 8 and 12 miles distant respectively, the old pan amalgamation process being used with an extraction of 75% to 85%, the ores being free from base metals. The total production from the Argus and Monitor mines is reported to have aggregated close to \$2,000,000.

The ores from the Argus mine as milled averaged between 45 and 50 ozs. silver and 80 cts. gold per ton. In the 90s these properties closed down, with the decrease in price of silver. The material of the principal lode is quartz and feldspar, containing pyrite and manganese, much oxidized at the surface and assaying \$1 gold, 1 oz. silver, with traces of copper and

lead. During the past 2 years the sulphide primary ore of this fissure has been opened at a depth of 240 ft. just above the contact with the bedded deposit at two places in the old Argus workings. This ore is a black quartz, with portions of white quartz and calcite, stringers carrying galena 4%, zinc (blende) 6%, gray copper 1% and silver 12 oz., of an average value of \$27 per ton at present metal prices. The solutions forming this primary ore also extended into the contact forming the bedded deposit, altering the gray lime to a jet black siliceous lime carrying small values in galena, zinc and copper and silver, except where secondary enrichment has taken place by shattering along fault planes, where the ore is of commercial grade. This constitutes the upper strata of the bedded deposit.

The ores now being developed are in the main fissure at a depth of 256 ft., and grade up to \$100 per

tunnels, drifts, raises, etc., the deepest being on the Success, which is 300 ft. The property of the Success Co. constitutes an immense mineral domain and with proper development should become one of the big silver-lead mines of the west. Equipment consists of 50-hp. hoist, two 60-hp. boilers, a 4-drill compressor, drills, pumps, blacksmith shop, saw mill, pipe line 3700 ft. long, giving ample water supply, carpenter shop, store house, powder magazine, etc., office buildings, assay office, stables; \$110,000 has been expended in development. D. C. McDonald, one of the pioneer mining men of White Pine county, is manager and general director of the Success, with offices at Ely, Nev.

Hoan and Fourth of July.

Owned by M. B. Garrighan and associates of Ely, adjoins the Hidden Treasure, 3 miles west of Ely, and has made shipments of lead-silver and gold ore.

ARGUS PROPERTY AT TAYLOR, NEV.

ton in copper, lead and silver, which is extracted for shipment.

The Argus Mines Co. is capitalized for \$250,000, with 1,000,000 shares, par value 25 cts. and is controlled by the Harker estate of Canton, Ohio, and H. G. McCulloch of Ely, Nev. The company is a close corporation and has no stock for sale.

The Success Mining Co.

Owns valuable property in the Schell Creek range, 15 miles east of Ely, consisting of 28 claims. The formation is dolomite lime, shale and quartzite. The ore, carrying gold, silver and lead, makes in the lime, a bedded deposit between the shale and quartzite, some 1200 ft. in width. Lead ores, up to 66% carrying \$3.50 gold and 30 to 40 ozs. silver have been shipped from the Fairplay claim. A vein on the Success claim has been opened 180 ft. in length and down to the 200 level, which is better than 3 ft. wide, principally a brown and yellow carbonate. Shipments show 123 ozs. silver, \$12.80 gold, 65% lead. A feature of this ore is the gold content, which frequently runs as high as \$60 to \$80 per ton in the carbonate ore. Development consists of over 3000 ft. of shafts,

The Hoan is developed by shaft and tunnel. Shipments run 4 oz. silver, 35% lead and carry some gold.

The Silver Bell Group.

Fourteen claims, located at the head of Grass Valley, White Pine county, 85 miles east of Ely, and owned by W. B. Bergman and associates of Ruth, is being developed, and shows from 1% to 8% tungsten ore, carrying high-grade silver values up to 200 oz. Samples of tungsten up to 12% in a 14-in. vein in granite is being run on by tunnel and drift and some good ore put on the dump.

Butte & Superior Oil Flotation Plant.

The Butte & Superior preliminary report for July on its oil flotation plant compares as follows:

	Tons ore.	Costs per ton.	Zinc con- cen.,	Value per ton.
July	45,875	\$3.64	8,686	\$48.83
June	48,475	10,830
May	50,688	3.22	11,653	65.25

Treating Zinc-Lead Tailings in Utah.

STAFF CORRESPONDENCE.

A concentrating plant is in operation at Midvale, Utah, treating 60 tons per day of zinc-lead tailings, which resulted from the operations of the plant of U. S. Smelting, Refining & Mining Co. The tailings deposit is on the Jordan river, and embankments are made to hold back the excess of water. In the midst of the tailings an excavation was made, which was allowed to fill with water, where a small barge is floated; and upon this barge is placed a Krogh 3-in. centrifugal pump, electrically driven. By this means the well-watered tailings are pumped to a higher point and passed through a trommel, to take out coarse sand, thence through an Esperanza classifier. A second pump of same kind forces the material to a sump on higher ground, in which it is settled, and thickened by an overflow of excess water. This sump is 4 ft. deep and 30 ft. diameter. The thickened pulp is moved toward the center by mechanical devices,

TAILINGS ON JORDAN RIVER, UTAH, BEING TREATED BY THE CHILDERS LEASING CO.

and finds an outlet through the cone-shaped bottom, whence it passes by gravity to the concentrating mill, consisting of a 6-cell Minerals Separation machine, cleaner cells and tables. The mineral froth from the main cells passes to a cleaner cell, and the tailings to a rougher air-cell of Callow type. The overflow from the latter goes to another cleaner cell, and the tailings to waste dump. The second cleaner-cell product is returned to the head of the mill. The final product is taken from the first cleaner cells. This is dewatered to some extent and passed over Wall tables by which the lead and zinc concentrates are separated.

Some of the product marketed ran 45% lead and 35% zinc, all of which is sulphide, the extraction being about 75% of lead and zinc. The flotation machines used here are belt driven, instead of by gears.

This material is finely divided, 92% of the lead concentrates will pass a 240-mesh screen, and 25% of the heads will pass 400 mesh. The idea is to install an Oliver filter to dewater the zinc concentrates; the lead concentrates are dewatered by decantation. The capacity of the plant is to be increased. The

heads are said to run 2½ to 4% lead, and 7 to 8% zinc. The plant is owned by the Childers Leasing Co. E. R. Richards is general manager, assisted by H. B. Richards; C. C. Brayton, San Francisco, is president of the company.

The plant of Midvale Minerals Co., practically completed, is beginning operations on another section of the mill tailings deposit from the U. S. Smelting, Refining & Mining Co.'s concentrator at Midvale. This new mill has a capacity of about 200 tons. It is equipped with nine double-cell Janney flotation machines used as roughers, each one operated by a separate motor, and three Janney cleaner cell machines; also 12 Overstrom-Deister tables of Deister Concentrator Co. make.

The tailings, containing lead, zinc and iron, are forced to a classifier building by a 300-gal. Krogh pump, anchored on a small barge in the tailings pond. The first stage is to pass them through a trommel, the oversize passing out as waste; the undersize goes to two Dorr classifiers, the coarse goes out as waste, and the fines go to two Dorr thickeners. The thickeners, or partly dewatered pulp, pass to emulsifiers, and then to the flotation rougher machines. The concentrates from the latter are passed to cleaner cells, the rougher tailings to waste. The cleaner-cell product is carried through distributors to six tables by which the lead and zinc concentrates are separated. The cleaner-cell tailings are passed over six other tables. The table tailings are returned to thickeners, and thence to the mill circulation again. An Oliver continuous filter has been installed to dewater the zinc concentrate. J. W. McKim is superintendent of the plant, interested in which are Kirk & Leavell, Salt Lake, and associates.

Montana's New Powder Plant.

The du Pont's new powder plant being built a few miles from Butte, Mont., near Silver Bow, is rapidly nearing completion. The site covers about 1000 acres and is ideally located for the purposes of a large plant. When completed it will supply powder for Utah. Montana and Idaho mining enterprises and construction work. The local field is one of the largest in the country and by manufacturing the powder here the company will save thousands of dollars of freight charges. Sulphuric acid, an essential commodity in the manufacture of powder, is a by-product of local smelters and recent discoveries of potash will aid the company in obtaining materials for use in manufacturing the finished product. Whether the recent agitation of the government advisers to have powder factories located inland to prevent them from falling into the hands of an enemy who could reach the seacoast in time of war was instrumental in determining the site of the present factory, is, of course, problematical. Butte should benefit much from the new factory in a material way.

Mining and Smelting at Casapalca, Peru

THOMAS F. ROCHE.*

Casapalca, where the Backus & Johnston Co. operates, is noted as one of the oldest mining camps in the copper districts of Peru. It is situated on the Rimac river, 13,700 ft. about sea level and 153.3 km. from Lima along the line of the Central Railway of Peru. The village consists of 3000 inhabitants, the smelter of 500 tons and the concentrating mill of 200 tons capacity. The clearest idea of the operation of the smelter and the mill can be obtained from the following extracts from a report of the superintendent.

Ores from Morococha and other points near the line of the Central are received in cars and weighed on railway scales above the smelter. Samples are taken there and the ore is unloaded into storage bins located at the top of the smelter, these having a capacity of 5000 tons. In the bins the ore is classified according to its chemical analysis. The remainder of the ore for the storage bins goes direct to the blast furnaces without being screened. The flue dust is periodically removed from the chamber and sent to the briquetting department. Here it is mixed with burned lime, and pressed into briquettes. These ores are classified as follows: (1) Coarse ore from the screening plant. (2) Raw ore direct from the storage bins. (3) Sintered ore. (4) Briquettes.

Smelting.

The charge for the furnaces is made up from these four classes to which is added slag from the converters and limestone. The charges are made up in side dumping cars and dumped into the furnaces. The molten product runs into brick lined steel tanks called settling tanks in which matte separates from the slag. The slag overflows into a stream of water which graduates it and carries it into the river. The matte is drawn off at intervals and sent to the converter. Air at 15 lbs. pressure is used in converting and from the converters the copper is cast for shipping.

Concentrating.

In the concentrating plant the ore is first crushed in a gyratory crusher and then reduced in a ball mill. From the ball mill the ore is sent to the screens, from which the coarse particles go to a jig, and the fines to hydraulic classifiers. The jig concentrates go to the smelter; the tailings are discharged into the river and middlings are recrushed and treated on the tables. The fines going to the hydraulic classifiers are separated into various sizes to be treated on tables operating at various speeds according to the character of the ore. The slimes are collected as usual in the sump tank at the bottom mill, and from this pumped to a settling tank. The filtered slime cake is then sent to the blast furnace.

Mining.

The principal mines of the district are the Lower Carlos Francisco, Upper Carlos Francisco, Chuquichucho, Corina and Cuarenta. They yield about 3000 tons monthly. Shortage of labor keeps the production down to this figure. Privately owned mines of the district produce 1000 tons a month, all of which is smelted at the Backus & Johnston plant. About 50 miles of tunnel have been drilled in the different mines and in Lower Carlos Francisco there are eight levels opened. These levels are reached by an electric hoist, while the ore is hauled out by an electric tramway. The latter runs in the mine a mile and a half. During the last 5 years air drills have been installed resulting in increased and greater facility in production. The augmentation in production is helped by the new shrinkage system of stoping as this way of attacking the ore gives more confidence to the miners. The upper mines were worked 200 years ago by the Spaniards and some of the ore which they and subsequent owners before the time of the present company mined and deposited on the dump is being concentrated by the present owners.

Transportation and Power.

Though, considering all, transportation is excellent, they still use the time-honored method of Peru, the llama. While the greater part of the ore is received by rail, a good quantity is also packed on llamas. Each llama carries 100 lbs. of ore. Some of the ore is received over a narrow gauge tramway connecting with some of the nearby mines. Ore from the lower workings of the Carlos Francisco mine is sent directly to the smelter and concentrating mill, while that from the upper workings of the same mine is sent down over an aerial tram.

Power is supplied from two hydro-electric stations, one at Casapalca, the other at Bellavista, about 2 km. above Chicla. The first contains two 150-kw. generators, besides the water driven blowers for the blast furnaces and sintering pots. In this plant are also located two air compressors for the mines, the blowing engine for the converters, a motor driven turbo-blower for the blast furnace, and all of the electrical apparatus for utilizing the power transmitted to Casapalca from Bellavista. At Bellavista are two 800 kw. generators driven by water taken from the Rimac and the Yauliaca, the latter a small tributary of the Rimac. The water is conveyed about 2 kws. by canal, thence by a steel pipe to the water wheels, where it is delivered under a head of 83 meters. Power is transmitted to Casapalca at 10,000 volts, and there stepped down to 2000 and 440 volts for distribution about the works. The Casapalca plant derives power from the

*In the West Coast Leader.

Rinca river and water from the Carlos Francisco mine. The electric lines from this plant are connected with those of the Cerro de Pasco Co., so that either company can help the other in case of a shut down of their electric plant.

Miscellaneous.

There are about 70 staff employes and 1200 native operators at the smelter. Considerable has been done in the way of making surroundings as agreeable as those in a more central place. Club houses and like for social affairs are being constructed. Besides the regular hospital for treating injured patients and those with non-contagious diseases, an isolated hospital is kept by the company.

Although nearly 14,000 ft. above sea level, the average temperature for the year is 45° . The thermometer seldom records less than 32° nor more than 60° . The combination of height and proximity to the equator are responsible for this even climate. Casapalca is about 10° south of the equator. The seasons are known as the wet and the dry, although some years they seem misnamed, because during the wet season, from September to April, more than half the days are clear, and during the dry season there are at least 5 or 6 days with some rain or snow.

The copper which contains silver, and sufficient gold to pay for refining, is taken over the Central railroad to Callas and shipped to Chrome, N. J., for electrolytic refining.

Improvements in Dump Cars.

Samson D. Wright, of Cleveland, O., and Samuel R. Vanderbeck, of Philadelphia, Pa., have invented improvements in dump cars, relating more particularly to preventing endwise movement of the body upon the frame and to giving greater facility in swinging the body at the dump. They have been granted a patent upon their invention (No. 1,187,593) and the essential details are as follows:

In operation the car normally rests upon the supporting bars (5) and (6), and is held against endwise movement by reason of the ends of the body with the pivots being mounted between or inside of the flanges (9) of the pivot members so that the pivots engaging the flanges at the ends and hold the body. The body is held against transverse movement by means of the pivots engaging the stops (12) on the one hand and the inclined flanges (10) on the other. In this way the body is held by reason of its weight against endwise and transverse movements.

When the car is to be tilted or dumped, suitable hoisting mechanism is connected to the hooks (13) on the side opposite to which the car is to be dumped and the body is tilted, the body turning upon the pivots which engage in the angle of the pivot members on the side of the car corresponding to the one upon which the car is to be dumped.

When the car reaches complete dumping position

the flanges (22) engage the flanges (10) and prevent the body from being tilted beyond the proper point, this point being one which is not the center of gravity of the car body so that upon the release of the hoist-

AN IMPROVED DUMP CAR.

ing mechanism the car body will have a tendency to assume normal position upon the frame or bed of its own weight.

Study of Castings of Zinc Bronze.

An investigation of the various foundry operations influencing the properties of castings of one of the most generally used commercial alloys, known as government bronze having the composition 88% copper, 10% tin and 2% zinc, has been completed by the Bureau of Standards and the results just published in Technologic Paper No. 59. The quality of metal castings is usually determined by measuring the properties of a test specimen cast from that particular metal. The investigation included a study of the effects of temperature of casting, methods of casting, molding, etc., kind of sand, heat treatment, and the effects of similar factors upon the resulting mechanical properties. A microscopic examination of the fractured test specimens was also made which showed that the most common source of weakness is the occurrence of oxides within the metal. Such oxides appear frequently as thin films throughout otherwise sound metal producing a condition of brittleness and low ductility.

Notes on the Park City Mines and Mills, Utah

W. A. SCOTT.

Daly-West mill, Park City, is concentrating 130 tons per day of sulphide ore, containing lead, silver and zinc. The mill heads run approximately 4 to 6% lead, 6 to 12 ozs. silver and 4 to 6% zinc. A coarse silver-lead product is made on Franz jigs; a finer lead-zinc product on Hartz jigs, and coarse and fine concentrates on Wilfley tables; and finally, a silver-lead froth is recovered from flotation machines of the Federal Lead Co. type. The zinc slimes, as much as possible, are kept out of the flotation process.

The mill ore is first reduced to 2-in. size by a jaw crusher, the product passing to a 2-mesh revolving screen; the screen oversize is recrushed to ¼-in. in Symons rolls. The entire product is then carried up an incline by a 120-ft. belt conveyor to the head of the main concentrating mill, where it is classified in a revolving screen. There are two sets of Franz jigs, one of which takes the screen oversize, and the other the undersize after it has passed through an Akins classifier. The slime from the latter goes to a Janney classifier. The Franz jigs make a heavy lead product and a middling of mixed lead and zinc, the middling being reground in a set of Sherman rolls. This reground product is elevated to Colorado Iron Works impact screens, the 6-mesh oversize being concentrated in Hartz jigs, the undersize passing to a Janney classifier through a launder. The Hartz tailings are concentrated on three Overstrom tables. The coarse material from the Janney classifier is treated by 10 Wilfley tables, the middlings therefrom being reconcentrated over another set of Wilfleys. The fines from Janney classifiers are retreated by Wilfley slime tables. The tailings from all tables pass to fine Hartz jigs, and the headwater slimes from all tables are thrown by a centrifugal pump to a tank, the settlings in which go to the flotation machines of 16 cells. This mill, which was built after the destruction of the old plant by fire in 1913, resumed operations last May, after an idleness of several months. It is doing satisfactory work, in charge of John C. Thompson.

At the Daly-West mine, development has been in progress since completing the installation of the new Laidlaw-Dunn-Gordon air compressor and the Wellman-Seaver-Morgan hoist, both of which meet all the requirements of efficiency. Result of this work was to open new ore bodies on the 1700, 1900, 2000 and 2100-ft. levels. The ore in the higher levels is being missed by lessees under company supervision. Most of the ore being mined by company direct is taken from the Daly fissure, between the 1200 and 2100-ft. levels. This ore occurs in the fissure proper, and also in the lime bedding planes adjacent thereto. All of it is a sulphide, of varying grade. The highest grade

ore has been found above the 1200-ft. level; the ore bodies below that level are large, but of lower grade. The per cent of iron, with its accompanying lead and silver, has increased on the deeper levels. The zinc content has decreased some with depth, although high-grade zinc ore has been found on the 2000 level. A considerable tonnage of ore is shipped to the smelters without concentrating, and they are quite successful in separating milling ore from shipping ore as the two grades are mined. The following are on the Daly-West staff: H. G. McMillan, general manager; E. L. Talbot, general superintendent; Frank Kane, master mechanic; John C. Thompson, mill superintendent.

New Quincy.

The New Quincy mine, Park City district, adjoins the Daly-West on the south, and lies on the opposite side of the mountain from the latter. The New Quincy workings are connected with those of the Daly-West through the latter's 900 and 1200-ft. levels. The Quincy operations are carried on through the Daly-West, and at present it has no other outlet to the surface. Daly-West's 900 level south, having been extended into Quincy ground, opens the latter at a depth of 1300 to 1400 ft. below the surface; and its 1200-ft. level, in a similar manner, was extended into the Quincy at a depth 1600 ft. The Quincy's mine water, amounting to about 100 gals. per minute, is drained out to the Daly-West's 1200-ft. station, thence down to the latter's 2100-ft. level, where the drainage line is connected with the Ontario drain tunnel.

Two fissure veins have been opened in the Quincy, on which considerable development has been accomplished. These veins are within limestone from the surface down to 1000 or 1100 ft., and below that they become contact veins between limestone and quartzite. The ore consists mainly of sulphides of lead, zinc and copper, carrying silver and gold, in a quartzite gangue, and occurs in shoots. However, in some parts the ore makes out 20 to 60 ft. from the vein into the limestone bedding planes. Ore recently shipped sampled 30 to 50 ozs. silver, 10% lead, although that now mined in a new place is said to run over 20% lead. In some places there is 3 to 4% copper, but the last shipment contained only 1%. All the ore carries about \$1 per ton gold. P. P. Harrington, superintendent, states that shipments amount to 150 tons per month. This ore is hauled in mine cars to the Daly-West shaft, dumped into chutes, then loaded into cars on the latter's haulage tunnel. There is a 600-ft. shaft on the New Quincy, but, not being connected with the workings, is not used. W. Mont Ferry, Salt Lake, is president of the Quincy; A. L. Thomas, secretary. The directors are W. S. McCor-

nick, F. J. Hagenbarth, F. B. Cook, V. R. Hutchinson and Herman Bamberger.

Judge Operations.

The Judge Mining & Smelting Co., formerly Daly-Judge, is shipping close to 1000 tons of ore per month direct to smelters; and is milling about 250 tons per day, producing 50 to 75 tons per day of lead-silver concentrate, and 20 to 30 tons of zinc concentrate, the latter product averaging 45% zinc. The milling ore consists of three-fourths sulphide and one-fourth carbonate. In the mill a lead jig product and a zinc jig product are made, and a Marcy mill was lately put in place to regrind the jig tailings. The jig products comprise about one-third of the total zinc recovered in the mill, and one-half of the lead. The overflow slimes from the classifiers are passed to Dorr tanks, and thence to Callow flotation cells, four rougher and two cleaner cells. Tailings from roughers are reconcentrated on tables. The concentrates from cleaner cells are passed over Wilfley tables to separate the lead from the zinc. The cleaner tailings are passed back into the mill circulation.

At the Judge mine a new Allis-Chalmers electric hoist, capable of operating to a depth of 2500 ft., at a speed of 2200 ft. per minute, has been placed in position in a steel and concrete building, over the 3-compartment shaft. Waste is hoisted to the top of the shaft, and all ore is hoisted to the haulage level at the 1200-ft. station. The portal of the haulage is near the mill site. Other improvements consist of a new steel gallows frame, at the collar of the shaft, 72 ft. from collar to sheaves. Judge workings are drained through a connection at its 2500 ft. station with the Ontario drain tunnel. The lowest mine workings on the property are at a depth of 2300 ft. The exploration and development work are being kept far ahead of the mine production.

Snake Creek Mining & Transportation Co., subsidiary to the Judge Mining & Smelting Co., has driven the Snake creek tunnel a distance of 14,350 ft. from the portal, which is 9 miles from Heber. The purpose is to advance it farther to connect with the Judge mine, tapping the latter's workings at the 1900-ft. level. This tunnel is about 400 ft. higher than the Ontario drain. A volume of water equal to 19 second-feet is now flowing from it. It is figured that eventually it will be advantageous to use it for ore-haulage purposes.

Electrolytic Zinc Plant.

Judge Mining & Smelting Co. has under construction an electrolytic zinc plant in Deer Valley, 1½ miles east of Park City, where it has Union Pacific and Denver & Rio Grande railroad connections. The plant is to treat zinc concentrates, and will have capacity to produce 15 tons of pure electrolytic spelter per day. The process is to roast the concentrates, then leach the calcined product with a weak solution of sulphuric acid. The solution is then clarified of its impurities

and by-products. After this, the zinc is deposited on rotating aluminum cathodes, arranged in 120 electrolytic cells. The product is then stripped from the cathodes and melted and cast into pigs. The electric current consumption is estimated at 2500 kw. All the lead, silver, copper and cadmium are to be saved as by-products in the leaching process. The Utah Power Co., which obtained a large volume of water for power purposes from the Snake Creek tunnel, controlled by the Judge Co., will furnish the current for the new plant, which is expected to be in operation this autumn. The equipment includes transformers, motor-generator sets and motors.

G. W. Lambourne, Salt Lake, is general manager of the Judge Co., also of Snake Creek Co.; O. N. Friendly, E. M., who has been with the Judge Co. many years, is general superintendent, Park City.

Ribbed Tube Mill.

An improvement in tube mills, of the type comprising a shell liner having longitudinal wear members or ribs on the interior, has been made by Joseph S. Peterson and Walter B. Rogers of Smuggler, Colo. They have designed the wear members to be individ-

RIBBED TUBE-MILL LINER.

ually removable so that they can be renewed as they wear out. The accompanying diagram shows the simple method by which the idea has been worked out, and upon which they have been granted U. S. Patent No. 1,188,203.

Copper exports for the week ended Aug. 25 totaled 7287 tons; since Aug. 14 they were 25,205 tons, against 14,215 a year ago.

Four Stages of Cyanidation Combined in One

Since 1890 when cyanidation was introduced in a practical way to treat dumps containing gold in South Africa, practically nothing has been done until late years in the way of changing the general principles of the method, except for a few mechanical changes perfecting the operation of agitating, the filter press, clarifier and precipitation press. In this respect, J. N. Lewis has made something of a change in the method by combining the agitator, filter press, clarifier and zinc boxes into one machine, thus saving considerable labor by accomplishing each part of the process separately. In developing this machine, known as the Eureka cyanidation-precipitation machine, the general cyanidation practice has in no way been changed. The general well-known practice of four separate stages has simply been combined into one.

In Fig. 1, illustrating the laboratory machine, three compartments or cell-cases will be noted. The lower sides of these cell-cases are made from perforated plates, with air and water-tight plates making up the bottom. Two thicknesses of filtering material are placed next to the outer side of these perforated

FIG. 1.

plates. The first makes a partial filtration and the second is of a closer textured material for completely clarifying the solution, which next comes in contact with zinc and the gold precipitated. The barren solution then drops to the tank noted as the triangular shaped bottom part in Fig. 2. The pipe is shown leading from the bottom of this solution tank to the small pump driven by a sprocket and chain. The solution is then pumped to the right end of the tank and its flow into the cells may be controlled by the valve noted at the right end of the machine in the longitudinal view Fig. 2. The cell-cases are made to revolve on a horizontal axis driven by the chain and sprocket noted in Fig. 2.

In practice the ore is first crushed to the desired fineness and distributed in the cells of the machine to be spoken of collectively later as the container. The machine is then made to revolve slowly and the solution from the tank at the bottom is pumped around and forced into the end of the container and through the crushed ore. The pump aids in forcing the solution through the pulverized ore and filtering plates which with the perforated plates make up part of each cell-case. Agitation is accomplished by the revolving

motion on the horizontal axis. After going through the filter of only 2 ins. thickness, the pregnant solution encounters the zinc and is relieved of its gold, the barren solution draining back to the tank and again pumped through the cell cases as a second and weaker wash. This operation is continued for about 3 or 4 hours after which about 30 minutes are required to discharge and refill the container with another charge.

At any time during operation samples for various tests may be taken from the machine enabling the

FIG. 2.

operator to run the machine as the tests may designate is best. Oxygenation is cared for by the introduction of air from the compressor. In case a heated solution is thought necessary steam can be ejected into the container.

Among some of the features embodied are smaller space required, less labor and less chance for loss claimed to be made by passing the pregnant solution through long pipes. A laboratory machine handling test runs of from 100 lbs. to 300 lbs. is made as well as machines for practical use. The latter come in 20, 40 and 60-ton sizes each having respectively 17, 34 and 51 cells. The parts for each of these different sized machines are the same, the only discrim-

ination being the addition of 17 cells for each 20 tons of capacity.

These machines are handled by the Eureka Agency, 1531 18th street, Denver.

Spray System of Water Cooling Saves Power.

Taking as an example a modern steam turbine plant, operating at a vacuum of 26 ins., if this vacuum can be increased to 27 ins. the saving of fuel is 5%. Increase it to 28 ins. and an additional saving of 6% is made. Twenty-eight and one-half inches will gain

SYSTEM OF WATER COOLING AT THE COPPER QUEEN CON. PLANT, DOUGLAS, ARIZ.

another 4%—15% total saving in fuel in 2½ ins. increase in vacuum.

To increase the vacuum requires colder water—for 26 ins. vacuum the temperature of the condensing water must be not over 103° F., for 28½ ins. not over 68° F.

The spray system of cooling condensing water is the most efficient in use, and by lowering the tempera-

2000 H.P. SPRAY SYSTEM, SHOWING PROXIMITY TO POWER PLANT.

ture those few degrees brings about a great saving in fuel. By its use it is possible to obtain an average vacuum of 28 ins. the year round in almost all parts of the United States.

In cases where there is a cooling pond at hand, a spray system can be added to it with comparatively small outlay. Even when an earthen pond or cement basing has to be constructed the resulting economies make the cost of construction seem insignificant.

The spray nozzles are the most important feature of this system. They produce a fine uniform spray without clogging. They have removable turbine centers with large passageways. These are held stationary in the nozzles, and the water in passing through is given a rapid rotary motion. A central driving jet, which impinges on the rotating water at the orifice, causes it to be ejected in a fine, dense, uniform spray. The above, with the necessary piping, rests on concrete piers—an installation requiring practically no maintenance and having very long life.

Careful tests of the system show that the total loss of water from evaporation and drift is only 1½ in New England states—considerably less than with a cooling tower. The drift is in fact practically negligible, owing to the low pressure used. The particles, while broken into fine spray, are yet of sufficient size to settle within the limits of the pond.

The following tables are interesting, showing what the spray system will do on a typical cold winter day and a typical hot summer day.

TYPICAL WINTER DAY.

The editor will be pleased to give the manufacturer's name and address to those interested in obtaining more detailed information concerning this system.

The introduction of zinc dust as a precipitant of gold and silver from cyanide solutions is due to H. L. Sulman, who proposed its use in 1894.

Ore-bedding and reclaiming systems have proved highly satisfactory at all the plants where they are in use.

Why Highly Oxidized Red Lead is Superior

G. W. THOMPSON.*

The use of red lead in the preparation of paints for the preservation of iron and steel dates so far back that it might almost be said that the "memory of man runneth not to the contrary." The red lead so used has varied greatly in composition, particularly as to the percentage of true red lead contained therein. True red lead has a formula of Pb_3O_4 and the percentage in red leads used for painting may vary from 70% up to 100%. Red leads which do not contain 100% of true red lead are considered as mixtures of red lead and unconverted litharge, PbO , litharge being the material from which red lead is produced by oxidation.

There has been much progress made in the manufacture of red lead during the last 25 years. This progress is to be noted principally in two directions—one is that in general the red leads have gradually increased in the percentage of true red lead present; the other is that red leads have generally become finer through better methods of grinding. These two ways in which red lead has improved in quality are closely related. It has been found that in most cases a red lead low in true red lead is comparatively coarse, the litharge present being found inside the coarse particles. By finer grinding the surface of the particles has been increased, thereby permitting higher oxidation and the consequently higher percentage of true red lead.

That red lead may be considered par excellence the pigment to be used in the production of paints for the protection of iron and steel is indicated by numerous tests conducted by Cloyd M. Chapman, of Westinghouse, Church, Kerr & Co., who found that the protective value of numerous composite paints tested by him was roughly in proportion to the red lead present. To be more exact he found that those paints which contained red lead were always the best paints.

The tests conducted by Committee D-1 of the American Society for Testing Materials on the Havre de Grace Bridge were extremely interesting. Paint No. 11 was graded as best out of nineteen paints. It stood in the first class after 7½ years' exposure. A paint, the pigment of which was red lead, was used, the red lead containing 95.9% true red lead. Paint No. 10, which was the next best paint was rated in the first class for 5½ years. For the remaining 2 years it was rated in class two. A paint, the pigment of which was red lead, was used, the red lead containing 88.5% of true red lead. Paint No. 6 which was third in value was rated in class one for 4½ years and class two for 3 years. The pigment in the first coat of paint was mostly red lead, the balance being a magnesium silicate.

It is unnecessary to consider here the other Havre de Grace tests, except to note that those immediately following in grading contained some red lead in the paints, while those that were graded lower down in the scale contained no red lead or only insignificant quantities. These Havre de Grace Bridge tests speak eloquently for the value of red lead paint for the protection of iron and steel. They also point to the desirability of using a red lead containing a high percentage of true red lead.

This latter conclusion deserves careful consideration. Two questions present themselves—Is a red lead containing a high percentage of true red lead best because of its containing less litharge or because of its physical qualities? We have shown that a red lead high in true red lead is generally finer than one low in true red lead, and it is proper to ask whether superior fineness is not the determining factor rather than absence of litharge. In endeavoring to answer this question a number of samples of commercial red lead, varying in percentage of true red lead, were sent us from different sources and we tested these by a system of classification by flotation, whereby we were enabled to determine the percentage of relatively coarse particles these red leads contained. These coarse particles we customarily call sandy lead, and they may be considered as in the main being composed of particles having a diameter greater than one four-hundredth of an inch. This figure has been obtained by microscopic measurement. The percentages of true red lead and coarse and sandy lead obtained on these samples are as follows:

True red lead. Per cent.	Coarse and sandy lead. Per cent.
95.16	1.90
92.21	11.34
90.10	17.76
88.21	21.62
82.53	28.72

These figures show in a very striking manner the truth of the point for which we are contending, that as a general rule the finer the red lead, the higher will be its contents of true red lead. Of course, it is obvious that this is not a necessary condition. In the manufacture of red lead, litharge or its equivalent is subject to a temperature of about 900° F., with an ample supply of air, and the usual custom of manufacturers is to carry this oxidation on as far as is practicable. They can of course draw out from the furnaces before this oxidation is complete, in which case, however, they would probably have a red lead which when rubbed out would show streaks due to the presence of unconverted litharge. It is possible also for a manufacturer of red lead to mix litharge with his red lead after having manufactured it. Neither of these conditions are found to exist commercially, and it is true that commercial red leads of an equal

*Chief Chemist, National Lead Co.

purity show a percentage of red lead corresponding to the fineness of the product.

Reverting now to the figure given above as the minimum diameter of the particles included in the class known as coarse and sandy lead, namely one four-hundredth of an inch, and considering this in connection with the thickness of ordinary paint coatings, it becomes at once obvious why the highly oxidized and consequently fine red leads are superior for use in the making of paints for iron and steel. Paint coatings occupy space, that is, they have length, breadth and thickness. This being the case, it is very easy to show the direct relation between the spreading rate of a paint and its average thickness. We give here a formula which will help us in this conclusion:

- Let t = thickness in inches of coating
- a = sq. ft. coated per gallon
- $a144$ = sq. ft. coated per gallon
- 231 = contents in cu. in. per gallon

Then

$$t = \frac{231}{a144} = \frac{1.604}{a}$$

From which we get this table—

- A—Thickness in fractions of an inch of coating.
- B—Square feet at which a gallon of the paint is spread.

A	B
1/100.....	160.4
1/200.....	320.8
1/300.....	481.2
1/400.....	641.6
1/500.....	802.
1/600.....	962.4
1/700.....	1122.8
1/800.....	1283.2
1/374.....	600.
1/561.....	900.
1/748.....	1200.

The average thickness of a coating of paint for iron and steel may be one two-hundredth of an inch. In many parts, however, the coating may easily reach a thinness of one six-hundredth of an inch. If, therefore, a paint contains particles whose smallest dimension is one four-hundredth of an inch, it is obvious that the particle will stand out in a paint coating where the thickness of the paint coating is only one six-hundredth of an inch. Many particles of pigment classed as coarse or sandy lead are considerably larger in size than the size indicated by 1/400th of an inch diameter, and these will project still further through the paint film. Such coarse particles become therefore the weak point in the film, and corrosion may start around such particles. The paint film itself is weak at such points, as the coarse particle may not be completely encased in the oil of the film.

All this leads us to conclude that the superiority of a highly oxidized red lead is really due to its fineness. It is a better pigment. Its superiority, however, lies not only in the more continuous paint film it produces, but in its producing a better working paint, a paint that flows out well, but will not run, sag or weep.

In the Havre de Grace tests, paint No. 11, which

contains a highly oxidized red lead gave good satisfaction when each of the three coats was spread at 1200 sq. ft. per gallon. Paint No. 10 gave good results when each coat was spread at 600 sq. ft. per gallon, but it failed to give the best service when spread at 900 or 1200 sq. ft. per gallon.

Returning now to the question as to the function of litharge in red lead, we think we are justified in saying that so far as our accurate knowledge goes litharge is not a necessary component of red lead to be used for paints for iron and steel. It may be that some have obtained better results when litharge is present in appreciable amounts. Litharge in itself may or may not be of advantage to red lead. Speculative arguments do not help us. The experience of the practical user of red lead is and must be the final test. If any user of red lead finds that litharge has been of advantage it is obvious that this litharge can be added to the highly oxidized red lead at the time it is used just as well as it can be left in the red lead by the manufacturer.

If it is left in the red lead by the manufacturer, the chances are that the product so produced will be undesirably coarse and consequently not the best that the manufacturer can produce as a good pigment. If, on the other hand, the consumer buys a highly oxidized red lead, and still believes that litharge is an advantage in the red lead, he can add the amount of litharge which he thinks is necessary and thereby have complete control of the chemical and physical composition of his paint. If litharge is used in this way, it should be the very finest that is obtainable and the manufacturer should be expected to furnish the litharge on as rigid specifications as the red lead with which the consumer intends to mix it.

As to whether red lead containing litharge withstands the chemical action of the atmosphere, we can simply refer to our own experience. Whenever we have exposed a paint composed of a highly oxidized red lead, it has kept its color longer than when a similar paint made from a low oxidized red lead has been similarly exposed. There may be highly oxidized red leads in regard to which we have no information, which are subject to the destructive action of the atmosphere. It may be that such red leads are converted to carbonate and sulphate more readily than other red lead containing large percentages of litharge. We have yet to see it demonstrated, however, that the highest grade of red lead now on the American market is affected as much when used in paint by the destructive action of the atmosphere as the ordinary commercial red leads containing high percentages of litharge.

It would seem, however, that this highest grade of red lead does not need this kind of trivial defense. Its real merit lies, as we have pointed out, in its being the best form of red lead used in the preparation of paints for iron and steel, and the fact that it retains its color when so used is of minor importance.

It must be remembered, however, that such a high

grade red lead conforms to the best usage in paint practice. It is now furnished ground in oil and can be used on the job with the same ease that white lead-in-oil can be used. It obviates the dusty and wasteful practice of mixing dry red lead with linseed oil on the job. In this respect it is a more sanitary product.

In all we have said, we wish it to be understood that we are not condemning any form of red lead for the protection of iron and steel. We are simply pointing out that this particular kind of red lead, the highly oxidized kind, is the best that can be made from the standpoint of protection to the iron and steel, ease of application, and all the other good qualities that should go with a superior product.

Managaneose Deposits in Virginia and Maryland.

The great demand for manganese ores and the high prevailing prices lend additional interest to a recent report on some manganese mines in Virginia and Maryland, by D. F. Hewett, of the Survey. The demand for large amounts of manganese ores in this country began in the period 1865-1870, with the introduction of the Bessemer and open-hearth processes of steel making, and has grown enormously. The domestic supplies have furnished only a small fraction of the manganese required by our industries—in 1915 only about 3%, and from 1910 to 1914 only 1%.

Virginia has contributed more heavily than any other state to the domestic production. Five of the six deposits described in this report are on the east side of the valley that lies west of the Blue Ridge and is commonly known as the Great Valley of Virginia. They coincide roughly in position with the outcroppings of a group of Cambrian shales and quartzites. The other deposit lies well east of the Blue Ridge, in the piedmont region. Psilomelane is the commonest manganese mineral of all the ores, but manganite and wad are also present. The ores are all of near-surface origin and were formed mainly through the replacement of clays and schist by manganese carried in solution in the ground water. Some of the clays replaced were the residual products of rock weathering, others were deposited in ancient stream channels, and still others were formed through the crushing of wall rocks along zones of fracturing. The greatest depth to which the ores have been traced is 260 ft.

Many manganese deposits in other regions are the result of presentday processes of oxidation and deposition through the agency of air and the surface waters. The Virginia deposits were formed not long ago, in Tertiary time, and furthermore that the manganese oxides were in part deposited below the permanent ground-water level, their formation resembling in this particular the deposition of certain of the Lake Superior iron ores.

It is considered improbable that manganese ores in any of the Virginia or Maryland deposits will extend to depths of more than 500 ft.

Production of Salt in the United States.

The average reader does not realize the importance of the salt industry of the United States. According to the recently issued report by the U. S. Geological Survey, there was produced in 1915, 38,231,496 bbls. of 280 lbs. each.

Michigan ranked first among the states both in the quantity and the value of the output of salt in 1915. The quantity of salt produced was 12,588,788 bbls (1,762,430 tons), valued at \$4,304,731, an increase of 917,812 bbls. (128,494 tons) and of \$1,005,726 in value compared with 1914.

New York ranked second among the states in both quantity and value of the salt produced in 1915. The output was 11,217,471 bbls. (1,570,446 tons), valued at \$2,976,405, an increase of 828,157 bbls. (115,942 tons) in quantity and of \$151,672 in value.

Ohio ranked third among the states in both quantity and value of output of salt in 1915. The quantity produced was 5,880,243 bbls. (823,234 tons), valued at \$1,462,192, an increase of 379,407 bbls. (55,651 tons) in quantity and of \$141,638 in value, compared with 1914.

Kansas ranked fourth among the states both in the quantity and the value of the salt marketed in 1915. The quantity produced was 3,765,164 bbls. (527,123 tons), valued at \$1,035,879, an increase of 707,300 bbls. (111,622 tons) in quantity and of \$111,329 in value, compared with 1914.

Louisiana ranked fifth among the states in quantity and sixth in the value of the salt produced in 1915.

California ranked sixth among the states in quantity and fifth in value of the salt produced in 1915. The quantity produced was 1,048,457 bbls (146,784 tons), valued at \$694,070, a decrease of 51,986 tons in quantity and of \$88,850 in value, compared with 1914.

Salt was made by only one operator in Idaho in 1915 and the production came from Stump creek, Bannock county, in the southeastern part of the state.

The production of salt in Nevada in 1915 was 6929 bbls. (970 tons), valued at \$3950.

The production of salt in Texas in 1915 was 44,978 bbls. (62,297 tons), valued at \$345,944, an increase of 109,999 bbls. (15,400 tons) in quantity and of \$94,451 in value, compared with 1914.

The production of salt in Utah in 1915 amounted to 394,850 bbls. (55,279 tons), valued at \$266,334, an increase of 19,393 bbls. (2715 tons) in quantity and of \$34,822 in value, compared with 1914.

Small non-condensing steam turbines are now coming into more general use as auxiliaries in mine power plants for driving excitors, centrifugal boiler feed pumps, centrifugal pumps for condensers, etc.

Benzol, one of the many by-products from the coking of coal in by-product ovens, is a colorless, inflammable liquid hydrocarbon having the chemical formula C_6H_6 .

The Stockholders' Responsibility

LETSON BALLIET.

About 15 years ago I was employed to examine a mine for a mining company that had three long tunnels, and two good veins of ore. They were driving a fourth tunnel much lower down, to tap their veins 1000 ft. deeper. It was a good mine—and it is a good mine today. There were about 500 stockholders in that company—I don't know who they were, for I was not a stockholder. I was only an employed engineer to make a report.

My report said: "Your mine is a good one—the opening of the vein at the great depth that will be reached by the lower tunnel should make it a big producer of ore. It will take about 10 months longer to drive the lower tunnel in to the vein, and will cost about \$4000 a month for that time. After that you can expect the mine to produce profitable ore, if you spend \$4000 for 10 months in driving the tunnel

Do you know what those 500 stockholders did? They just sat down quietly and waited 10 months, without making any more payments or furnishing any money at all. Of course the work had to stop. There wasn't money enough coming in to pay even a watchman, at the mine which had already spent \$100,000.

Ten months later the stockholders began writing to me, saying that "10 months were up" and that I had said "the mine will be producing in 10 months." Of course I had told them nothing of the kind. I had said that "if they furnished \$4000 a month that they could expect the mine to be producing at the end of that time."

The man who was manager of that mine is now a very high official, and a very competent man in mining operations, but at that time he was a poor man working for wages, and had to hunt another job when the stockholders quit furnishing money for his and the miners' wages.

That mine, of course, couldn't pay bills; its cars and track were stolen when they couldn't pay a watchman, and it was idle for years, and abandoned. Later it was taken up by others and is today a good property.

The outcome of that experience of 15 years ago is that I learned a lesson, and that is—never set a time limit when a mine can be expected to pay. If you were to ask me when will a mine pay I would answer, "When a level has been run 1000 ft., or 500 ft. or 100 ft." or whatever work had to be done. Never in months.

You might ask me, "When can I rent rooms in a new hotel I am going to build?" The answer is, "When it is completed." I don't know whether you are going to build it in 6 months by rushing the work, or whether you will build it at all, or build it next year or year after. It is evident that the quicker

you get it completed the sooner you begin to collect room rents.

I find that 90% of the mining propositions that stop work are forced to stop by the stockholders failing to push the work—failing to provide funds. When a mine manager says, "We can have the mine producing in 6 months or a year," the stockholders sit down and wait a year—and the mine stands idle. Sometimes they are abandoned, and the same manager will hunt up someone else to buy it in, and open it. Thus the same mine, with the same manager, becomes a big paying mine, and the stockholders accuse him of being crooked—when their real cause of loss is that they didn't furnish the money to open it and get the ore out.

If you are a stockholder in any mine, and you have sat quietly by for years, without making any effort to keep your mine running, you deserve to lose every cent. The hardest part of mining is to raise funds sufficient to develop it right. You expect a secretary or a manager to "raise the money" and keep the records and direct the work. Suppose you were elected secretary, could you do it? You'd expect others who were interested to raise some of the money, too, wouldn't you?

A director, or officer, is only a stockholder, like yourself, who has been elected to act as a head, or keep a record of all business. Maybe he has less stock than some of the other stockholders. Don't blame him if your work isn't going on as fast as you'd like to see it; he can't make it go faster than there is money to pay for the progress. He simply directs what money there is to the best advantage, and keeps a record of what is done. Stockholders have no one to blame but themselves for speed of progress.

There are hundreds of mines now working that were started by some former owners, who failed, and gave it up. New men took it up, and went ahead with the work and reaped the profit the original owners might have had if they had gone ahead. With the exception of two, I think every operating mine in Tonopah and Goldfield is a reorganization—reorganized to raise operating finances, yet the same working methods, on the same property, and in many cases under the same managers, are producing handsomely. Some of them have been changed to assessable companies to force the stockholders to come through with operating expenses and thus they have been able to make them produce. An idle mine can't pay—it must reach its ore and take it out before it can pay. No mine can reach its ore without money to buy supplies and hire men. These are cold facts.

Mining is a business that must be developed. Mining investors frequently lose enthusiasm and quit—or

get cold feet. Quitters nearly always lose—there is no chance to win success when you quit and run away. The stickers, who finish their development, are the winners in the end.

Everybody belongs to one of the two classes—they are either "stickers" or "quitters." It makes no difference whether a quitter quits in the first hour or in the eleventh hour, just when victory is in his grasp, the result is the same.

If you are not enthusiastic about your business you can't expect others to be. If you have no enthusiasm, and no ambition to make your business a success, don't go into it in the first place. If you start, stick. Make it a success by your own efforts.

If your mine needs funds for further development, for building ore bins and so forth, it naturally falls on you as a stockholder, or partner, in the mine to furnish your share of that expense, before the returns can be taken from the ground. If you can't furnish \$1000, or \$500, or \$100, right now, you can at least furnish \$10 or \$20 or perhaps \$50 a month, for a few months, which will accomplish the same result. It is strictly up to you how fast the progress is. Spread your enthusiasm and stick-to-it-ive-ness to your neighbors and friends, and interest them. If you were a partner in a grocery store you'd rustle your friends for patronage, and boost your business, until you became established.

Use of Slags for Fertilizing.

Utilization of iron and steel works slags was discussed by E. C. Brown, chief civil engineer, Carnegie Steel Co., Pittsburgh, in a paper read before the Engineers' Society of Western Pennsylvania and printed in the January issue of the Proceedings of the Society. Little commercial or industrial use, he said, has been made of either open-hearth or converter slags, as compared with blast-furnace slag. When slag is high in lime it may be returned to the blast furnace as a flux. Open-hearth slag has been ground and used in agriculture as a soil corrective, giving higher and quicker results than lime applied in the usual form. At Birmingham, Ala., slags from high phosphorus local ores are being built up by recharging until they contain as high as from 12 to 18% of phosphorus, thereby being about in the same class of fertilizer as imported "Thomas meal" or phosphate slag.

A dry granulation process, he mentioned also, has been developed in Germany for preparing slag for cement. The essential feature of the process is a rotating cylinder into which the slag stream is directed with a blast of air and a small amount of high-pressure steam. The product is dense and contains but little moisture.

Britania metal is an alloy of 10% antimony and 90% tin.

THE CREW OF THE DEUTSCHLAND.

The American people are naturally divided in their sympathies as regards the warring nations of Europe. But they are noted for their fairness as well, and a feeling of admiration arose when through ingenuity and daring a seemingly impossible feat was accomplished. In the above, for which we are indebted to the *Marine Review*, is shown the crew of the German submarine *Deutschland* which recently completed its record voyage to the United States and back to Germany. Of interest to the mining fraternity is the knowledge that part of the return cargo of this vessel was nickel bars.

What the Mining Companies are Doing

Consolidated Arizona Smelting Co.

The following condensed statement of operations for the first half of 1916 has been issued by the Consolidated Arizona Smelting Co.:

	First quarter.	Second quarter.	Half year.
Blue Bell and De Soto mines produced, tons	25,618	28,237	53,855
Concentrator treated, tons	19,369	20,884	40,253
Smelter treated (custom material included), tons	20,842	26,077	46,919
Gold production, ozs.	905,143	1,576,297	2,481,440
Silver production, ozs.	21,903.57	35,787.62	57,691.19
Copper production, lbs.	1,681,000	2,450,000	4,131,000

Net profits during the same periods were as follows:

January	\$26,312.50		
February	55,770.78		
March	78,395.52		\$160,478.80
April	\$93,889.48		
May	87,660.75		
June	67,473.84		
Half year			\$409,502.87

Barnes-King Co., Montana.

The second quarterly report of the Barnes-King Development Co. for the period ending June 30, 1916, shows as follows:

Receipts—	
Balance March 31, 1916	\$184,709.59
North Moccasin bullion	62,490.21
Piegan-Gloster bullion	20,992.10
Kendall power plant earnings	3,185.90
Kendall power plant merchandise	4.57
Kendall mine royalties	446.25
Interest received	475.57
Miscellaneous items	178.50
Total	\$272,482.69
Disbursements—	
North Moccasin property	\$ 46,663.33
Piegan-Gloster property	65,438.08
Shannon property	29,116.60
Kendall property	37,809.64
Woodrow Wilson property	5,099.39
Other expenses	32,783.34
Total	\$215,068.78
Cash in bank and on hand	49,474.06
Bullion in transit	7,939.85
Total	\$ 57,413.91

Nevada Con. Co.

The report of the Nevada Con. Copper Co. for the quarter ended June 30, shows a production of 24,091,021 lbs. of copper, as compared with 19,160,274 lbs. in previous quarter. Profits were \$4,853,945, compared with \$2,781,811 in March 31, 1915, quarter.

The income account compares as follows:

	June 30, 1916.	March 31, 1916.	Dec. 31, 1915.	Sept. 30, 1915.	June 30, 1915.
Earnings	\$4,853,945	\$2,781,811	\$2,739,196	\$1,590,621	\$1,365,094
Dividends	1,449,592	999,728	999,728	749,769	749,746
Balance	\$3,354,352	\$1,782,083	\$1,739,468	\$ 840,824	\$ 614,297
Depreciation	185,079	142,360	142,724		
Ore extinguishment	109,355	88,498	82,228	228,472	230,309
Surplus	\$3,059,917	\$1,556,225	\$1,514,515	\$ 612,352	\$ 383,988

Copper production in pounds compares as follows:

	June 30, 1916.	March 31, 1916.	Dec. 31, 1915.	Sept. 30, 1915.	June 30, 1915.
First month	7,716,101	6,157,862	5,880,082	6,292,413	4,710,684
Second month	7,723,148	6,436,853	5,495,487	6,281,858	5,271,756
Third month	8,651,772	6,565,550	6,912,360	6,021,850	5,123,480
Total	24,091,021	19,160,274	18,287,930	18,516,121	15,106,920

Average monthly production was 8,030,340 lbs., compared with 6,386,758 lbs. in previous quarter. The cost of copper produced, including Steptoe plant depreciation and all charges except ore extinguishment, and after crediting all miscellaneous earnings, was 8.51 cts. per pound, as compared with 9.65 cts. for previous quarter. Excluding the item of de-

preciation the cost was 7.78 cts., as compared with 8.94 cts. for previous quarter. The earnings for the quarter are computed on the basis of 27.23 cts. per pound. On June 30 company had no copper available for delivery unsold.

Ray Con. Co.

Ray Con. Co. reports net earnings for the quarter ended June 30 of \$3,242,542. Production amounted to 18,667,664 lbs. of copper in concentrates, as compared with 15,801,568 in the previous quarter. The income account for the past five quarters compares as follows:

	June 30, 1916.	March 31, 1916.	Dec. 31, 1915.	Sept. 30, 1915.	June 30, 1915.
Net operating profit	\$3,226,749	\$2,191,592	\$1,791,599	\$802,775	\$1,367,736
Miscellaneous income	15,792	13,954	16,383	14,172	9,398
Total	\$3,242,542	\$2,205,547	\$1,807,982	\$816,947	\$1,377,135
Bond interest			29,415		36,249
Balance	\$3,242,542	\$2,205,547	\$1,778,567	\$816,947	\$1,340,886
Dividends (50c)	788,589	789,302	777,482	547,802	647,035
Surplus	\$2,453,952	\$1,416,245	\$1,001,085	\$233,470	\$ 793,850

The average net cost per pound of all copper produced for the quarter was 10.507 cts., compared with 10.579 cts. in previous quarter.

Earnings for first quarter this year are based on a price of 28.067 cts. per pound for copper, as compared to 24.598 cts. for first quarter of 1916.

Production for past five quarters follows:

	June 30, 1916.	March 31, 1916.	Dec. 31, 1915.	Sept. 30, 1915.	June 30, 1915.
First month	6,162,117	4,164,043	5,894,441	4,352,571	5,303,213
Second month	6,106,657	5,539,408	5,576,083	5,581,734	5,016,048
Third month	6,398,890	6,098,117	5,725,009	4,997,083	4,205,119
Total	18,667,664	15,801,568	17,195,533	14,931,138	14,524,380

Average monthly production in first quarter of 1916 was 6,222,555 lbs., compared with 5,267,189 lbs. in previous quarter.

President Aldrich says: Both tonnage and production for quarter were greater than for any previous quarter, and notwithstanding that average daily tonnage treated exceeded by nearly 1000 tons highest average previously maintained, both recoveries and costs compared favorably with the best heretofore made, thus illustrating the benefit which is just beginning to be derived from plant improvements that have been in progress for several months.

Upon June 30, after payment of the second quarterly dividend, the company had a net surplus of quick assets of \$8,157,832. Of this, \$1,814,659 was cash and cash accounts in process of immediate collection, the balance being represented by copper and other metals in transit and operating supplies.

Wolverine Copper Mining Co.

The Wolverine Copper Mining Co. reports for the year ended June 30 as follows, comparing same with previous years:

	1916.	1915.	1914.	1913.	1912.
Receipts	\$1,369,286	\$929,193	\$484,061	\$1,326,501	\$1,327,030
Total expenses	634,068	610,991	402,936	724,987	713,840
Profit	735,218	318,201	81,075	601,514	613,180
Dividends	660,000	360,000		600,000	540,000
Total surplus	862,529	787,311	829,109	748,034	746,520

President Stanton of Wolverine Copper Co. says in part in annual report: The decrease in production was due primarily to the severe winter. Decrease in copper contents is noticeable as bottom limits of territory are approached, but as rock is of considerable commercial value, we will continue to open the mine to bottom, and as we gradually acquire a full-working force results should show an extraction of greater tonnage which will insure larger product. It will require two years or longer before we will reach the bottom of the mine, and directors believe it will then require 10 years to exhaust the mine.

The balance sheet of June 30 shows cash amounting to

\$80,936, deposit in trust company \$450,000, copper on hand sold \$252,546, cash and supplies \$55,663, accounts receivable \$14,572. Mine debts and accounts payable total \$71,189.

Alaska Gold Mines.

The Alaska Gold Mines milled 150,403 tons of ore in July, assaying an average of \$1.24 per ton, as compared with \$1.06 in June. Preceding months compare as follows:

	Tons ore milled.	Assay value per ton.		Tons ore milled.	Assay value per ton.
July	150,403	\$1.24	March	162,796	\$1.03
June	164,800	1.06	February	122,856	1.02
May	175,215	1.40	January	119,914	1.42
April	165,930	.94	December	114,183	1.36

Extraction and loss in tailings we compare:

	% of extraction.	Loss in tailings per ton.
July	80.64	24c
June	79.25	22c
May	82.85	24c
April	78.71	19.8c
March	77.47	20.3c

General Manager Thane reports as follows: "Mill was closed July 4 and 5 for the holiday. During the month, heads have steadily increased due to better conditions for operation of the three stopes east on the sixth level, which are in condition to deliver a good tonnage. August should show an increase of tonnage and heads over July."

The July report shows improvement over June, which was one of the poorest months the company has had. In July there was a decrease of 14,400 tons in the tonnage treated, due in part, of course, to the shutdown for the holiday.

The encouraging feature was an increase in the assay value of the ore to \$1.24 per ton, against \$1.06 in June. The July assay is much below the original estimates of the engineers—that the ore would show an average gross value of \$1.75 per ton, from which the tailings loss would probably be 25 cents per ton. On this basis it was expected that a profit of 75 cts. per ton of rock would be realized after mining and milling costs of 75 cts. per ton.

Calumet & Hecla Co.

The Calumet & Hecla Mining Co. has filed with the Massachusetts secretary of state a statement of its financial condition, dated Dec. 31, 1915, which compares with that on April 30, 1915, as follows:

Assets—	Dec. 31, '15.	Apr. 30, '15.
•Real estate	\$ 4,542,183
•Machinery and equipment	15,628,995
Real estate and machinery		\$36,999,904
Merchandise, material, stock in process	5,531,006	6,019,623
Cash and debts receivable	2,404,647	3,672,065
Patent rights and licenses	84,971
Investments in other companies	19,625,746	22,792,400
Sinking fund investment	1,599,823
Total	\$49,317,375	\$69,483,994
Liabilities—		
Capital stock	\$ 1,200,000	\$ 1,200,000
Accounts payable	1,280,865	294,416
Floating debt	4,134,000	4,134,000
Profit and loss	63,855,577
Surplus	42,702,510
Total	\$49,317,375	\$69,483,994

•Book values.

Bingham Mines.

Bingham Mines has called \$89,000 bonds for retirement at 102, this being the balance of an original issue of \$587,000. When the bonds are cancelled the company will be free of all bonded indebtedness. At the time of its organization in 1908 Bingham assumed \$902,000 first mortgage bonds issued by its predecessor, and it also issued \$577,790 in second mortgage income bonds to take care of floating indebtedness. The first mortgage bonds were all retired from earnings prior to April 1, 1914. The second mortgage bonds at maturity in January, 1914, were exchanged for \$587,000 first mortgage 6 per cent convertible sinking fund bonds. In April, 1915, \$87,000 bonds were purchased and retired, and since then

\$411,000 bonds have been converted into stock. The \$89,000 bonds called for retirement will clean up the issue.

Bingham's net earnings from its own operations in May totaled \$15,426, which is at the rate of \$185,112 per annum, equivalent to \$1.27 per share. Bingham controls through stock ownership the Eagle & Blue Bell Mining Co. The latter paid 20 cts. a share in 1913; 15 cts. in 1914; 15 cts. in 1915, and 5 cts. on July 24 of this year. Assuming a return of 15 cts. a share this year on the Blue Bell stock held by Bingham Mines, the latter's net income should be equivalent to \$2 a share.

Miscellaneous Notes.

Receipts of the Nevada Douglas Con. Copper Co. for the quarter ended June 30, 1916, totaled \$497,524.

President Utley Wedge of the Tennessee Copper Co. says the four suits instituted against the company by Wm. H. Steiner & Son, involving \$980,853, are unwarranted; that the only purpose in filing them was to anticipate action that would be taken against Wm. H. Steiner & Son by Tennessee Co. Mr. Wedge also says counter suits will soon be filed and that the copper company has nothing to fear from present actions.

Operating profits of the McIntyre Porcupine Mines for the quarter ending June 30 were \$120,000. This is by far a big margin above the best showing on record. For previous quarter the total was \$97,128, and for the quarter ending Dec. 31, \$75,486. It is understood that latterly the rate of operations has exceeded considerably that of the first half of the period.

Arizona Copper Co. turned out 4,800,000 lbs. of copper in June, which was at the rate of nearly 60,000,000 lbs. per annum. The strides which this company has made in increasing its output since Dr. Ricketts completely remodeled the smelter have been noteworthy, and the current rate of operations represents a record volume for this Scotch-owned mine in the American Southwest.

The Jim Butler Mining Co. reports for 6 months to June 30, 1916, net profits of \$157,837, or at the rate of 18¼ cts. per share yearly on the 1,718,021 issued shares. Profits in the entire year 1915 were \$186,720; in 1914, \$110,087, and in 1913, \$102,682. Liquid assets as of July 1, 1916, include \$232,867 cash in bank; \$63,963 receivable, and 339,994 ozs. silver, a total of \$466,828, counting the silver at 50 cts., or \$514,428 reckoning silver at the prevailing market, around 64 cts.

Butte & Superior Co.'s capitalization has been increased to 290,069 shares as the result of the exchange of 17,500 of its shares for 35,000 shares of the common stock of the American Zinc, Lead & Smelting Co. By the same transaction American Zinc's issued common stock is increased to 228,120 shares, exclusive of 96,560 shares of preferred, which latter pays \$6 per share, cumulative, and is retireable at not less than par. There will also be outstanding \$4,000,000 in 10-year 5% bonds, and \$2,000,000 in short-term 5% notes, upon acquisition of the Granby properties. Formal acquisition takes place Jan. 1, 1917.

Considerable dissatisfaction exists among stockholders over proposed plan for reorganizing Ohio Copper by bondholders. Sale of property by foreclosure will take place Aug. 29 at Salt Lake City. Under the plan the only recognition Ohio stockholders get is the right to subscribe to bonds of a proposed new company at par and interest. In the first reorganization stockholders paid an assessment of \$1 a share, to supply working capital. The response was liberal and later it was discovered that a considerable portion of the assessment went to meet claims presented by the late F. A. Heinze, who then dominated the company. For the past year the Ohio property has been operated under lease. The lease, it is understood, provided for the payment of interest on the bonds, with further provision that profits over and above certain amounts should be paid to the receiver. Just how much has been paid over under his lease has never become known in New York, although net in a single month is said to have been well above \$100,000. With profitable operations now possible under existing metal market conditions, it has been felt that conditions of the proposed reorganization have been unnecessarily harsh toward stockholders who have already stood by the guns in one reorganization.

*Yours Sincerely
W. B. Clark*

WHO'S WHO IN MINING.

The subject of this week's "Who's Who in Mining" is ex-U. S. Senator William Andrews Clark of Montana, whose likeness appears on the opposite page. Besides being recognized as the world's largest individual mine operator, he is interested in numerous commercial enterprises, many of which are affiliated with mining. His greatest holding, perhaps, is the United Verde Copper Co. of Arizona, of which he owns practically all the shares. Since entering the dividend-paying class this company has paid dividends, mostly to Mr. Clark, totaling to the end of June, \$37,822,000. Other holdings of Mr. Clark include railroads, banks, cattle, sugar, lumber, real estate, flour mills, etc.

Mr. Clark's greatest activities may, however, be said to have been with Montana mining, where he owned numerous properties, many of which have since been sold to others. Anaconda being among the purchasers.

Co-Operative Selling of Metals and Manufactures in Export Trade.

The advices from London stating that British interests have contracted to purchase more than half of Australia's zinc output, not only during the war but for ten years afterward, throw striking light upon what are to be the applications of the economic policies agreed upon at the recent Paris conference of representatives of the allies.

The avowed purpose of this agreement is to put out of business so far as possible the zinc smelting industries of countries which are enemies of the entente powers, and this proof of a resolution to carry on a trade war, after the war of armies and navies is ended, must give neutral nations food for reflection.

It is plain warning to them to provide for their commercial security even after the war is over, lest they be involved in trade wars in which they have nothing to gain and much to lose. It adds powerfully to the argument for the prompt enactment of the pending industrial legislation in this country.

Among the most important of the measures now before Congress is the Webb bill, permitting American exporters of metal and manufactured articles to combine for the purpose of engaging in export trade.

An inquiry addressed by the editor of this paper to President Wilson, asking for his position on the subject, brought the answer printed on page 380 of our August 26 issue, which shows that the whole

weight of the National Administration will be thrown in favor of such legislation.

The recently published plea of Chairman Hurley of the Federal Industrial Commission for support of the Webb bill is indicative of the fact that the federal government is anxious to bring about commercial as well as military preparedness. It is only fair that American manufacturers be enabled to engage in international trade under the same rules as foreign manufacturers. Guns and commerce go together. We cannot demand a fair deal without being able to enforce our demands.

The sympathetic co-operation of the government with business will make the United States supreme in the commercial world. The public has gradually come to a realization that "big business" does not necessarily mean "bad business." Modern international trade competition demands combination and organization, and it is most fortunate that our highest government officials realize this fact.

Every European government permits cartels and syndicates which result in strength sufficient to compete in foreign markets and it was by just such methods that Germany was forging ahead to industrial supremacy when the war broke out. When peace is declared, not only that country but every other will adopt the same methods again. The United States cannot afford to attempt to enter into competition for foreign trade unless our metal producers and manufacturers can enjoy the same advantages.

The Price of Silver.

The recent spurt in the price of silver leads to the belief that a restoration to the high price of 77¼ cts. in May is among the possibilities. At that time the price advanced about 30 cts. With a similar rise the price would be near to the ancient parity of 16 to 1. There is, however, not at present much expectation that the price will go to any such figure.

The present demand is not only very strong from the far east, but is very heavy in Europe, where it is being coined rapidly to pay the troops. Bankers in this country have manifested great interest in the extent to which the latter coinage will go. It amounts practically to reopening the mints to free coinage on the old basis, but it is not believed it will extend to what will amount to inflation. It is well known that all of the belligerent nations have issued immense sums of paper money, which are more or less covered by gold reserves.

One New York banker is of the opinion that free silver coinage may be adopted by all of the belligerent nations after the war simply as an alternative to repudiation of large amounts of paper money or allowing it to become greatly depreciated. Apparently there is no general belief that such a thing will take place, although it must be admitted that important changes in world finance are to come when the war is over

and national obligations are put on a permanent basis. About the only result in this country is that a number of mines long abandoned because of the low price of silver are going into commission, and this new supply may have a depressing effect upon the price.

Precautions Necessary to Avoid Forest Fires.

The season has arrived when conditions are such that the danger from forest fires is greatest. After the long dry season when the underbrush is like tinder and to which the dead leaves are beginning to fall, it takes only a spark to start a bad fire. Many of the forest fires are started from sparks from fires left smoldering by thoughtless hunters, prospectors and others. Once started these fires are difficult to extinguish and may soon spread and be the beginning of destructive forest fires.

The greatest sufferers from forest fires are the lumber and mining interests and the devastations of recent years have taken a heavy toll from them, both in property losses and lives. It is too heavy a tax to pay for carelessness. Most forest fires are preventable, and easily preventable, by the exercise of care and common sense. Campers should select a safe place for building their camp fires and whenever leaving camp should make sure that no burning material is left behind from which fire might possibly spread. Neglect of these simple precautions is inexcusable.

The disastrous forest or brush fires of recent years which brought destruction and death to the mining camp of Porcupine, Ontario, and to the Coeur d'Alene mining region of Idaho and Montana, and in other mining regions, taught the necessity of keeping the ground around the mines clear of underbrush, always a source of danger.

These simple precautions are usually neglected through thoughtlessness or through a disinclination on the part of the mining men to go to the trouble or expense to protect themselves before it is too late.

The present year has so far not been distinguished by serious fires in either the United States or Canada. Have the lessons been well learned or are the fates being kind?

Experts in copper assert the industrial consumption of the metal at present absorbs two-thirds of the output of the world's mines. This combats the generally accepted theory that the war requirements are responsible for most of the advance in prices. There was an advance in copper last Thursday by the large producers from 27½ to 27¾ cents, or an advance of ¼ to ½ cent from the prices of the previous day for first quarter 1917 delivery. Little copper is to be had for delivery this year.

The limited means available for the opening of some mines has brought the ingenuity of the management of these mines into active play, and the various devices improvised and applied to the work in hand are instructive, though sometimes amusing.

PERSONAL.

Matt W. Alderson is in Marysville, Mont., looking over the country in that section.

Edwin S. Berry, mining engineer, will open consulting offices in New York on Sept. 15.

Curtis F. Burt, mining engineer, has returned to Yerington, Nev., from Houghton, Mich.

W. B. Pool and U. T. McCurry, Spokane, Wash., are in Slocan, B. C., inspecting properties.

Horace A. Scott has been elected instructor in geology at the Missouri School of Mines, Rolla, Mo.

C. B. Croner, mining engineer, Pasadena, Cal., recently examined the Alvord mine, near Otis, Cal.

I. Kamimura, chief mining engineer for the Mitsui Bishi Co., Japan, is visiting in Kennett, Cal.

Walter A. Burrows, Jr., Brainerd, Minn., has been elected president of the Thomas Iron Co., Easton, Pa.

W. N. Smith, mining engineer, has joined the staff of the Canadian Copper Co. at Copper Cliff, Ontario, Can.

George H. Heintz has left Denver, Colo., and is now with Platt & Cleff, mining engineers, Leadville, Colo.

W. C. Orem of Boston, general manager of the Nevada-Douglas Con. Copper Co., has been recently at the company's property.

R. E. Cranston, mining engineer, San Francisco, Cal., is on an extended professional trip through Colorado, Montana and Nevada.

H. L. Brown, Denver, Colo., and C. A. Heberlin, Los Angeles, Cal., engineers with the American Metal Co., are in Spokane, Wash.

H. K. Najarian, formerly with the Nevada Con. Copper Co., is now with the Missouri Cobalt Co., Fredericktown, Mo., engaged in smelter designing.

J. H. Kern, managing director of the Hypotheek Mining Co., Kingston, Idaho, has returned to Moosejaw, Sask., from a trip to the company's property.

Morton Webber, mining engineer, after being wounded while with the British forces, has returned to associate himself with Ellis P. Earle, New York.

I. L. Church, formerly of Cobalt, Ont., is now superintendent of the Moose mine, River, Manitoba, and has recently returned from a trip back to Cobalt.

B. B. Thayer, president of the Anaconda Copper Co., Anaconda, Mont., has been in Potrerillos, Chile, looking over the property of the Andes Copper Co.

B. S. Butler and F. L. Ransome of the U. S. Geological Survey are now in Salt Lake City, Utah, relative to work in the American Forks and Alta districts.

James McNaughton, vice-president and general manager of the Calumet & Hecla Co., Calumet, Mich., will change his headquarters to New York after Dec. 1, 1916.

F. W. Traphagen, former professor of metallurgy at the Colorado School of Mines, is now president of the Colorado Metal Mining & Reduction Co., Denver, Colo.

W. A. Bancroft of Boston, secretary-treasurer of the Mass, who supervises that property for the Boston office, is making his summer trip to the Copper Country.

A. E. Redner, captain of the East Norrie group of mines on the Gogebic range, has resigned to become superintendent of the Anvil mine at Bessemer which belongs to the Newport of Ironwood, succeeding Alex. Clusk, who has been promoted

to be assistant superintendent of the Newport. Mr. Redner's place will be taken by H. W. Byrne, assistant chief engineer of the East Norrie group.

Thomas A. Stroup is now assistant engineer for the Utah Copper Co., Salt Lake City, Utah. He was formerly on the engineering staff of the Tennessee Copper Co.

J. C. Devine, president of the Pinal Development Co., Ray, Ariz., has returned from a trip to Chicago and other eastern cities via Salt Lake and San Francisco and has opened an office for the company in Phoenix, Ariz.

Milnor Roberts, dean of the University of Washington College of Mines, Seattle, Wash., is on his way to the Copper River region, Alaska, where he will examine a number of properties in the neighborhood of the Kennecott Bonanza.

J. H. Musgrave, mining engineer with the British Columbia Department of Mines, is making examinations of prospects for owners. He is now in Nelson, B. C., and will later visit Cultus creek, Bayonne camp, and Hall and Lockhart creeks.

OBITUARY.

On Aug. 17, 1916, A. T. Rankin, a prospector of the Cripple Creek district since 1874, died from apoplexy at the age of 65. He was born in Keosauqua, Ia., to which place he was taken for burial.

John Edwards died on Aug. 21, 1916, at his home at Burlington, Mont., a short distance east of Butte, Mont. The deceased had been prospecting the old workings of the Blue Bird mine for some 31 years and at the time of death was 54 years old.

Barney Dougherty passed away at Philipsburg, Mont., Aug. 19, 1916, after having prospected in that vicinity of Montana for over 24 years. He was 68 years of age, a veteran of the Civil War and owned considerable property in Ross Fork, near Philipsburg.

Martin Goldsworthy, head mining captain of the Chapin mine, Iron Mountain, Mich., passed away on Aug. 16, 1916, at his home. He had been an active mining man in the Lake Superior district for 34 years, having spent most of his time around Iron Mountain, to which place he came from the copper mines near Calumet, Mich. He was a member of the Lake Superior Mining Institute and at the time of death was 67 years old.

J. McDermott, Oreville, S. D., died on Aug. 10, 1916, in Deadwood, S. D., at the age of 78 years. He was a pioneer of Colorado, Montana, Alaska and the Black Hills district, South Dakota. He made seven trips into Alaska and was among the first in the gold rush to that country. His last trip there was made when he was 70 years old and then he covered over 800 miles on the Yukon. In the Black Hills he operated placers near Golden Gate. In 1883 he opened the Hartman iron mine in Wyoming.

SCHOOLS AND SOCIETIES.

National Exposition of Chemical Industries.—At this exposition the American Electrochemical Society has arranged a series of very interesting meetings beginning on Thursday morning, Sept. 28, with the "Made in America" technical session at the Grand Central Palace. This session will be devoted to papers and discussions on the great and varied electrochemical industries of America. This will be followed on Friday morning by another technical session, devoted to the theoretical side of electrochemistry. Registration will be held on Wednesday evening at the exposition. Headquarters of the Electrochemical Society will be at the Electrochemical Society booth at the exposition.

TRADE PUBLICATIONS.

Storage Batteries for Mine and Industrial Locomotives. The Electrical Storage Battery Co., Philadelphia, Pa. Bulletin 159; pp 7; illustrated.

The construction and features of the battery for this particular use are dealt with in the first pages and accompanied with several illustrations. The last four pages are given to illustrations of locomotives in the field using this type of storage battery.

Flotation Concentration Testing. Southwestern Engineering Co., Los Angeles, Cal. Bulletin No. 2; pp. 4.

In this bulletin the company has briefly spoken in regard to the nature of flotation tests in general and have given further details regarding tests made by it. The tests are divided into three classes, as those on 10 to 25 lbs. of ore, 100 lbs. and 150 lbs. The nature of the test run on each of these different classes is given with charges for the same.

Packing for Machinery, Piping, Etc. The Garlock Packing Co., Chicago. Catalog P-1913; pp. 140; illustrated.

In most cases an illustration of the packing, with a brief description and prices, is given. The catalog is indexed and the telegraph code is given in tabulated form. In indexing the different classes of packing have been classified according to the materials which are being handled, such as acids, air, brine, steam, etc. Under each of these headings another classification is made according to the particular use of the packing as for rods or plungers, pump valves, gaskets, piston rods, etc.

Bar and Tool Steel. The Midvale Steel Co., Philadelphia, Pa. Catalog No. 31; pp. 135; illustrated.

This catalog contains both an index and contents which are well arranged. Practical information is given regarding the properties of steel and its treatment. Various descriptive and detailed tabulated information is then given on the different grades of steel made by this company. Here the particular applicability of the different grades is brought out. In the last pages of the catalog a page description accompanies 24 reproductions of curves showing the critical temperatures and physical properties of Midvale steels.

INDUSTRIAL AND TRADE NOTES.

Edward H. Fowler, manager of Pacific Foundry Co., San Francisco, made a business trip to Salt Lake City last week.

The Lord Byron mill at Sugar Loaf, Colo., is being dismantled and shipped to Denver by the Morse Bros. Machinery & Supply Co., for resale. The equipment consists of crushers, rolls, roadsters and cyanide equipment.

Stimpson Equipment Co., Salt Lake City, has taken the sales agency of the Columbia Steel Co., San Francisco, for the intermountain territory, and will be in position to make quick delivery of manganese steel and nickel chrome steel.

The Brennan Engineering Co., 36 West Randolph street, Chicago, announces that its business has been incorporated under the name of the Brennan-Wahl Co. The company acts as consulting engineers—mechanical, structural, chemical—and manufacturers' sales and purchasing agents for machinery and allied products.

The Westinghouse Electric & Mfg. Co. of East Pittsburgh, Pa., has recently sold to the Montana Power Co. complete electrical equipment for the operation of a hydro-electric station on the Missouri river at Holten, Mont. The equipment furnished includes four 12,000-kva., 3-phase, 60-cycle, 6600-volt, 150-rpm. vertical water wheel generators; two 500-kw. 250-volt, 450-rpm. vertical water wheel exciters;

four 12,000-kva., oil-insulated, water-cooled, 3-phase, 60-cycle transformers, 107,000 volts high voltage, 6600 volts low voltage, with a maximum continuous rating of 16,000-kva.; switching equipment for the entire station, including type GA circuit-breakers for 107,000-volt circuits, and type E-6 circuit breakers for 6600-volt circuits. Battery charging motor-generator sets, air compressors, testing set, oil filter, and all other necessary adjuncts are included in the order.

W. D. Coos, who has been elected secretary-treasurer of the Lima Locomotive Corporation, brings to the duties of that position a long and varied experience in similar lines of work, beginning with one of the subsidiary organizations of the corporation. For a time, also, he was identified with the Westinghouse interests in the railway equipment field. The Lima Locomotive Corporation is now classed with the American Locomotive Co. and the Baldwin Locomotive Works as a builder of standard trunk line locomotives and is also known throughout the world for its industrial types, particularly in mining and logging operations. It has recently been engaged on large foreign orders.

NEW PUBLICATIONS.

Sand and Gravel in 1915. By R. W. Stone. Washington, D. C., U. S. Geological Survey. Mineral Resources of U. S. II:17; pp. 13.

In tabulated form the production is given by states for 1914 and 1915. The locations which produced glass-sand during the year are given and the concluding pages give the weight of sand and gravel per cubic yard.

Geology and Ground Waters of Northeastern Arkansas. By Lloyd W. Stephenson and Albert F. Crider. Washington, D. C., U. S. Geological Survey. Water Supply Paper 399; pp. 315; illustrated.

A complete review of the geology of the area as pertaining to water supplies is given. This is followed by a similar but more detailed review of the area by separate counties.

Gypsum in 1915. By Ralph W. Stone. Washington, D. C., U. S. Geological Survey. Min. Res. of U. S. 11:14; pp. 9.

Imports of gypsum into this country being small, the item is treated briefly. Market and trade conditions of the industry are reviewed for the United States as a whole and tables show the production of the mineral by states. Methods of preparation are briefly described and uses of both calcined and uncalcined gypsum are spoken of with respect to the manufacture of cements, plasters and fertilizing materials.

Rhodesia Chamber of Mines' Twenty-fourth Annual Report. Bulawayo, Rhodesia, Chamber of Mines. Annual Report, 1915; pp. 71.

A brief review on the proceedings of the Chamber for the year occupies the first 15 pages. Briefs are then given reviewing matters connected with mine operation, as sanitation, the labor question, metal production, etc. The general situation of the mining industry is gone into and reports of many of the mining companies are reproduced. Many items of financial interest are given as well as information relative to the effects of the war on the mining industry in this state.

Investigation of the Peat Bogs and Peat Industry of Canada, 1913-1914. By Aleph Anrep, Ottawa, Ont., Canada Department of Mines, Mines Branch. Bulletin No. 11; pp. 185; illustrated.

In the first pages of the bulletin each bog is described separately and are classified according to the province in which they are located. In describing the different bogs the quantity of peat available in each is estimated and the qualities of the same are given. In the appendix there appear 24 different articles descriptive of Canadian patents on machinery and methods for the handling and manufacture of peat fuel.

Late News From the World's Mining Camps

Editorial and Special Correspondence.

ALASKA.

Anchorage.

According to T. L. Young, in charge of the Bernard interests on Lewis river, the ground is not wide enough for a dredge. They found pretty good pay in the crosscuts and the river is a good proposition for hydraulic operations. He said they found pay on the Kellar claims in the old channel and that Sam Wagner and partners had quit the river and were now operating on the benches with good results. Chittick and Armstrong's last clean-up was favorable and these operators seem well satisfied with their prospects. Young will wait for word from Mr. Bernard in regard to future plans.

Dawson.

The excavation at the Yukon Gold is surpassed only by that at Panama, exceeding 40,000,000 cu. yds. in 8 years. Up to the present more than \$185,000,000 has been taken from the Klondike, more than 40% from recent machinery mining of low-grade. Streams about 8 or 9 ins. in diameter hit the icy gravel at 100 lbs. to the inch, and in other places the earth is first thawed by steam in pipes driven down 6 ft. apart, to depth of 40 to 50 ft. and then taken up by dredges, 26 bites a minute and a third of a ton to a bite. Nine dredges are thus working to get out the 60 cts. average of gold. In other places the content is but 20 cts., half of which is saved as profit. Some patches will run \$5 or more per yard. 1 or 2 cts. per ton is lost. The winters are so cold that the machinery cannot be worked more than 7 months a year.

Kennecott.

The Alaska-Westover Copper Co. owns 460 acres in southwestern Alaska, in the eastern end of the Chitina district, on the Nezina river, in the Copper River country. The property lies southeast of the Bonanza mine of the Kennecott Copper Corporation and the Mother Lode mine and is in the same formation as these properties, the Chitstone limestone. The development work done on the property to date includes 790 ft. of tunnel, 72 ft. of raises and 168 ft. of open cuts, developing about 8000 tons. Assays of this ore body vary from 30% to 50% copper, but the management places the average at 30%. On this basis the tonnage blocked out has a gross value of \$1,148,000, equivalent to about 38 cts. per share on the entire capitalization, without making allowance for gold and silver values, which are estimated at several dollars per ton. Including these values the ore reserves would have a total valuation of \$1,780,000, equivalent to 56 cts. per share. According to Superintendent Foster, a tunnel was started southwest from the No. 5 drift in solid ore and continued for 14 ft., when it was cut off by a slip. This is on an incline with the dip of the break that occurs at this point, and the ore continued up for 12 ft. At this point a change took place and the large body of ore was cut off, but was connected up by 1 ft. of copper glance that was much richer than anything formerly encountered on the property. This glance continued up to 90 ft. varying from 1 ft. to 6 ins. in width. The management believes that it will lead to an ore body higher up, as is indicated by the surface outcrop of glance 120 ft. above the present workings. Developments on the Kennecott properties have proved that these limestone deposits are continuous. The Alaska-Westover Copper Co. has an authorized capitalization of \$3,000,000, divided into shares of a par value of \$1, of which 2,250,000 shares are outstanding.

Treadwell.

Reports show that Alaska Treadwell in June crushed 78,918 tons, recovering \$131,730, or \$1.69 per ton. Operating

expenses were \$95,894; operating profit \$35,835; construction \$17,932; net profit \$18,443; other income \$11,200. Alaska Mexican milled 15,820 tons in June, yielding \$16,595, or \$1.05 per ton; operating expense \$24,992; operating loss, \$8,486; construction \$4405. Alaska United's Ready Bullion in June crushed 24,220 tons, yielding \$49,019 or \$2.04 per ton; operating profit, \$18,725; construction \$4003, net profit \$14,721. Alaska United's 700-ft. claim showed a net loss of \$26,934 on 20,335 tons of \$1 ore.

Valdez.

B. C. Wiltse, developing a copper group at Wells Bay, reports that he is now driving a tunnel on one of the claims for the purpose of tapping a 14-ft. vein at a depth of about 150 ft. The vein runs parallel to a rather deep canyon and about 150 ft. distant the tunnel being run from this canyon. It is expected to crosscut this vein within a short time, and if the values indicated by the croppings is upheld at this depth, a valuable mine is assured. The claims adjoin the Glendenning properties, on which development is now in progress on an extensive scale, and which are showing up well.

Angus Chisholm has purchased a one-sixth interest in the Gold King mine from Tony Dahlstrom. It is reported that Guftafson, Newman, Hanson and the new co-owner, Chisholm, who now own the entire property, have adopted a new policy and are planning on working the property on a larger scale.

An amount between \$8000 and \$9000 was the yield from about 26 tons of Cliff mine ore, run through the mill recently, or better than \$300 per ton. This ore was taken out of the mine last spring by Paul Capris. The Cliff mine, which was the first mine in this vicinity, under its former management, produced nearly \$1,000,000 and it is expected will continue to be a big producer. Recent development work at the mine has uncovered a considerable amount of high grade.

ARIZONA.

Ray.

Pinal Development Co. has ore ready to ship to the smelter at Hayden. The company will begin in September the sinking of a vertical shaft, to go to a depth of 500 ft., to open sulphide ore. Gasoline engines for hoist and air compressor will be used for the present.

Jerome.

For approximately \$100,000 the Green Monster Co. has taken over 32 new adjoining claims. Several units of the machinery plant, which is to be installed at the collar of the deep-working shaft on the Green Monster property, have arrived and the remainder are on the way. The new roadway leading to the company's camp from the main trail to Jerome has been completed with the exception of a few culverts, and the work of erecting the camp buildings is well advanced. As soon as the mine machinery is in operation the crew of miners will be augmented with a view to opening the ore bodies at depth in the shortest time compatible with safe and sane mining operations. In the interim work will be continued in the various tunnels for the purpose of making determinations which will serve as a guide to operations in the underlying strata of copper ore.

Recent developments in the Loma Prieta workings are very encouraging and lend emphasis to the contention of local mining men that a large and valuable body of copper sulphides underlies the Copper Basin section. The shaft on the property has a depth of 155 ft. and is in ore, heavily impregnated with chalcopyrite, from the 65-ft. point to its bot-

tom. In other words, the shaft is in ore for a depth of 90 ft. A considerable tonnage mined in sinking has commercial value, and there are several tons of sorted ore on the dump that carries 15% copper. A few days ago a level was established at 140 ft. and crosscuts started east and west in the ore. The face of the east drive is completely filled with chalcopryrite. This condition has prevailed from the shaft to the present point of development and presents indications of continuing several hundred feet further to the east. The west crosscut carries bands of ore impregnated with chalcopryrite which seem to be converging into a solid body as the cut is advanced. Water trouble is hampering operations considerably, due to the inadequacy of the small hoisting plant.

Another property in the Copper Basin country that is attracting a good bit of attention in mining circles is the McNulty & McBride, where a churn-drill plant recently began operations. Two shifts of nine men each are at work and three holes are being drilled. As yet no determinations have been made public. The holdings show very favorable copper indications at surface and nominal depth, however, and the opinion is general that the churn drills will disclose commercial values at depth. The venture is backed by the Crawford Syndicate.

Stringers of ore showing native copper have been encountered in the limestone-capping at a depth of 400 ft. in the Dundee-Arizona shaft. The property is located in the Jerome field and is viewed with favor by the mining men of that section. Considerable water is seeping into the shaft, but is not hampering operations as the plant of machinery recently installed is amply capable of handling both water and waste.

Satisfactory progress is being made in unwatering and retimbering the Jerome Victor Extension shaft and in installing the big pump on the 700 level. To date most of the unwatering has been accomplished by bailing and to good purpose taking into consideration the fact there were approximately 3000 ft. of lateral openings to be drained on the 700 level. For a while delays were enforced by the necessity of repairing certain parts of the hoist, by the jamming of the bucket in the shaft timbers just above the 700 level and by the non-arrival of timbers, coal and other mine essentials. Now, however, an adequate amount of timber, fuel, drill-steel, etc., is on hand and the work is progressing to better advantage than formerly.

Prescott.

F. A. Johnson has been appointed superintendent of the property of the Gold Blossom Mining Co., located about 6 miles south of here. Johnson has put three shifts on and will sink the main shaft to a depth of 500 ft. The present depth of the shaft is 200 ft. and on that level an ore body 3 ft. wide is being developed. Gold values are reported to run close to \$100 per ton. This ore body is to again be opened by crosscuts and drifts run out at the 400 and 500 levels. A hoisting plant, air compressor and other mine equipment is in transit to the property.

The Midnight Test group of gold-bearing claims in the Groom Creek country have been sold to R. M. Merrill of San Francisco. The property is one of a number of former producers in Yavapai county that has passed to outsiders of late. The retiring owner, Colonel Chase, of Faribault, Minn., opened the property to a depth of 400 ft. and mined a large tonnage of free-milling ore which was treated in the Nissen mill erected by him. The new owners have taken possession of the mine and are preparing to open it at greater depth.

Development of the recent strike in the Lady Alldy mine indicates it to be one of the most important made in the Chaparral section in a number of years. The ore body has a breadth of 3 ft., where opened on the 200 level, and is said to assay close to \$100 gold per ton. Ben Rybon and Dr. R. N. Looney, of Prescott, are the owners. The mine is being worked by the Smith brothers under a \$20,000 option to purchase.

Mayer.

Officials of the Big Ledge Development Co. announce the purchase of the old Treadwell smelter at Mayer and that it is at once to be overhauled and placed in commission. They likewise announce the purchase of the Hackberry and Gopher properties and the intention to thoroughly de-

velop them. The company has for some time operated the Henrietta and Butternut mines in the Big Bug country. The intention is to reduce the ores mined on all four of the properties mentioned at the smelter recently bought.

Humboldt.

A 50-ton reduction plant and a new equipment of mine machinery, all to be operated by a Semi-Diesel engine, are to be installed at once by the Arizona Mine Supply Co., of Prescott, at the Arizona mine. The property is being operated by Anderson & Birch and has of late been a frequent shipper of high grade silver-lead ore. When the new machinery is in commission the mine is to be opened at greater depth.

Manager W. S. Vilhelm of the New State mine, recently the scene of a strike of high grade gold ore, will at once equip the property with additional machinery, including a large air compressor and drills. The fissure from which the high grade is being mined continues on into the Elk and Perry properties, also controlled by the New State people. Hoisting and compressor plants are to be installed on these groups. All three of the properties are to be developed at depth as soon as the machinery is in operation. In furtherance of the plan accommodations for additional miners are being established and other surface improvements made.

CALIFORNIA.

Nevada City.

The Delhi Mines Con. has been formed, with a capital stock of \$1,000,000, to operate the Delhi mines, at Columbia Hill. The directors are C. R. Clinch, Frank Vestal, L. P. Larue and Roy Tremereaux of Grass Valley, and Carrol Searls of Nevada City. The mine produced good ore years ago and is considered a property of promise.

Crosscutting from the main shaft of the Pittsburg mine to penetrate the Gold Flat vein is progressing, but hard rock is retarding work. The crosscut is out 500 ft. and is expected to tap the ore body within 600 ft. The mine is well equipped.

Arrangements have been made to work the Massachusetts quartz property in the Gold Flat district, about 2 miles below Nevada City. The 2-stamp mill of the Norton mine, in Willow Valley, has been moved to the Massachusetts and will start crushing within 10 days. Some good ore has been opened. The property is operated by C. H. and E. O. Dougherty of Nevada City.

A new hoist has been installed at the Texas mine and sinking on the New York vein has started with 10 men. This ledge formerly produced some rich quartz and is expected to persist to considerable depth. The mill is running on ore from the main workings.

Placerville.

A large compressor and machine drills have been installed at the Rising Hope gravel mine on Webber creek, 3 miles east of Placerville, and a new bedrock tunnel will be driven beneath the lava cap to open the channels to advantage. About 2 miles of development work have been already accomplished and large bodies of excellent gravel blocked out. The property is equipped with a good gravel mill and washing plant. The mine is owned by Schuyler N. Warren and associates of New York.

Portola.

The Walker copper mine has been acquired by the International Smelting & Refining Co. and will be operated on a larger scale than originally planned. A flotation plant of 100 tons daily capacity was recently completed and everything is in readiness for a heavy output. The new lower tunnel and shaft are both in ore averaging better than 6% copper, and considerable gold and silver is also present. The new owners will expend at least \$25,000 on further developments.

Smartsville.

An option has been taken on the Campbell gravel mine by eastern people, and an effort will be made to work it by the drift process. A shaft will be sunk to bedrock and the channel thoroughly developed. The Campbell, also known as

the Blue Point, formerly ranked among the greatest hydraulic producers of California, but was closed following enactment of anti-hydraulic legislation. Several unsuccessful attempts have been made to work the mine, including the spectacular failure of the Tarr Mining Co. about 8 years ago, when efforts were made to mine the gravel by a combination dredger-hydraulic elevator system.

Laws.

The Tip Top gold mine has been acquired by the Louisiana Con. Mining Co. and is to be actively worked. A large tonnage of good-grade ore is stated to be exposed, and deeper work will be prosecuted. On adjoining property the company has taken an option for \$35,000. The group is equipped with a 10-stamp mill and it is likely capacity of the plant will be increased.

Grass Valley.

An eastern syndicate, headed by King G. Gillette, has acquired the California mine in the Deadman Flat section for approximately \$75,000. One-fifth of this is to be paid down and the remainder in four equal yearly payments. It is reported the shaft will be deepened, equipment provided and operations conducted along broad lines.

The final payment on the purchase price of the Union Hill will be made in a few weeks, and following this developments will be pressed with renewed vigor. Considerable tungsten has been produced in the past 6 months, and profits from this source have materially aided in development of the gold-bearing ledges. Augustus Cox is superintendent.

The California copper mine at Spencerville has been taken under bond by H. W. Morris and Thomas Benney of Grass Valley. Some high-grade ore has been found, with gold and silver occurring in fair percentages.

Carrville.

Operations have been resumed at the Strode mine after an idleness of 5 years. The ledge has been recovered and has widened to 5 ft., with the ore of excellent character. Seams of the quartz are stated to run into fancy figures. Twelve men are employed under supervision of H. L. Stewart.

Considerable prospecting is reported in the district, and several encouraging gold discoveries are reported. The vein recently uncovered in the Golden Jubilee continues to average around 2 ft. wide, with good ore in evidence. A number of small companies are working quartz deposits in the vicinity of Carrville, Coffee and Trinity Center.

Marysville.

The Yukon Gold Co. has filed suits against several prospectors in the vicinity of Smartsville to prevent further mining on placer ground claimed by the company. A temporary injunction has been granted and defendants have been cited to show cause why injunction should not be permanent. The Yukon Gold Co. is building a powerful dredger in the field and plans to erect two more in the spring. The territory lies in the Yuba River field, adjoining holdings of Yuba Gold Fields Con.

Howland Flat.

Construction of the mammoth restraining dam across Slate creek is progressing, with 25 men at work. The dam will be 50 ft. high, of reinforced concrete, and is expected to impound 4,000,000 cu. yds. of debris the first year. Its height will be increased as conditions justify. It will facilitate operation of numerous hydraulic mines in the Howland Flat, Port Wine, Scales, and other districts. Los Angeles people have secured control of the company and acquired water rights. It is planned to sell water to owners of hydraulic mines for operating purposes.

Angels.

Rich gravel has been encountered in the Rough Diamond mine, 5 miles from Angels. The deposit was intersected at a depth of 62 ft. and is stated to average \$30 to \$40 per ton. The channel is the Central lead, which has produced splendidly. It is planned to install machinery soon and to press work more vigorously. L. J. Hutchinson and David Oard are the owners.

Yreka.

The Spring Gulch quartz mine has been taken under bond by Seattle people and extensive prospecting is proceeding. Ten short tunnels have been extended and all are in ore of low grade. Altogether, about 3000 ft. of development work has been performed.

COLORADO.

Cripple Creek.

The Cripple Creek Deep Leasing Co. loaded out a 35-ton shipment from its lease on the deep levels of the Jerry Johnson mine on Ironclad Hill. The company is mining ore at both the 850 and 750 levels that is averaging close to 2 ozs. gold from the breccia-schist contact lying east of the shaft.

Charles Hill at a depth of not to exceed 30 ft. on his lease in the Ajax Co.'s mine has opened up a huge ore body. Except for dumping the rock over a screen, the ore is shipped as broken, and is returning values in carload lots of between \$15 and \$20. The full width of the ore body has not yet been determined and until a depth of at least 50 ft. is attained sinking will be continued. A drift may be run out from the 50-ft. point, when the dimensions of the ore body can be determined.

A new ore house is being constructed at the Dillon mine. Superintendent McCarthy expects to be using the structure by Aug. 28. The Dillon mine continues to keep two teams busy loading out ore and the daily shipments aggregate 70 tons. With the new ore house completed the tonnage will be raised to 100 tons.

A thorough and successful test is in progress at the Rex Gold Mining & Milling Co.'s Ironclad hill plant, on the low grade ores from the company's properties, on which the mill is located. It has been treating between 60 and 75 tons daily for about 3 weeks, and these tests have proven that the oxidized product taken out from the open cut, some of a value not to exceed \$1.25 a ton, can be treated with a slight margin of profit. Ore above this grade, and the general average to date has been close to \$4 a ton, costs no more to mine or treat, and handled at the full capacity of the mill, 100 tons daily, would be profitable.

Development is progressing at the Shoo Fly mine. A depth of 150 ft. has been attained in the shaft now being sunk on Womack hill, and with 35 ft. additional depth, at 185 ft. it is proposed to cut a station and drift through the lowana claim adjoining the Shoo Fly on the west. Connection is also projected with the lowana tunnel, thereby affording exit from and ventilation for the workings of both properties. This tunnel, long neglected, has been found upon examination to be free from caves and in good working condition. All that remains to bring the tunnel into use is to re-lay track. While development work is in progress, shipments will be limited. Manager Gilbert is carrying a filled stope and will ship heavily when the dead work is completed. The values are holding up in the ore broken and the next shipment to be loaded out will, it is expected, average better than 2 ozs. gold.

A good strike has been made in the Little Florence mine, owned by the Argon Gold Mining & Milling Co. and being operated under lease by M. Johnson. The vein as now exposed in the heading of the adit is from 2 to 3 ft. wide, and practically vertical, precluding present determination of the hanging or foot walls of the vein. The depth attained to date will not exceed 12 ft. and the gold is there from the subsoil down. The lode strikes northwest and as the adit is extended into the hill depth will be gained rapidly. Everything taken out to date, excepting some 3 or 4 tons of dump rock, has been shipped. Sampling the supposed waste rock it was a surprise to find a value of \$31 a ton. The "dump" will be loaded out with the next shipment.

Leadville.

The Prince of Wales Leasing Co., operating the Bartlett property on Sugar Loaf, which temporarily stopped developments several weeks ago for the installation of a power line to the property, has now resumed activities. The power line has been completed and all connections made. The lessees plan to sink the winze near the breast of the tunnel several hundred feet. A heavy flow of water was encountered in the winze while the work was being carried on last spring and pumping was necessary before sinking could continue. Electric pumps have been installed in the tunnel and everything is in readiness for extensive development. Rich bodies of high grade silver were found in the Bartlett during the early

days. The last large vein was lost in an expansive cave which partly closed the tunnel years ago. Conditions at the time made it inadvisable to reopen the tunnel in search of the buried ore shoot and it stood idle.

The Colorado Power Co. is constructing two lines. One is to the Mikado property, where G. O. Argall is planning a draining and development enterprise. One line will be brought to the Mikado from the Iron Silver line running to the Tucson on the top of Iron Hill while the other will be extended from the Yak-Waterloo line, which runs through Stray Horse gulch and Graham park. The construction work is progressing, and, according to Manager Morarity of the power company, the lines will be complete before they are required at the Mikado. The transformer will stand in Stray Horse gulch, just below the property.

Boulder.

The Degge-Clark Co., concentrating tungsten ores, formerly purchased outright all satisfactory ores offered. The new plan is to make a straight custom concentrator of the plant, receiving and running a shipper's product and turning over to him the concentrates. Lots of 5 tons and more will be treated separately and the concentrates delivered to the owner or stored for him. A regular schedule of charges for concentrating has been issued. The shipper may pay this charge in cash and remove his ore or Degge-Clark will hold the charge against the concentrates while in storage and will act as agents for the sale of the lot, subject to the approval of the owner. This plan will permit the miners to have their product reduced to commercial material and held in shape for immediate delivery on demand.

IDAHO.

Kellogg.

The July net earnings of the Caledonia Mining Co., which owns and is operating the Caledonia mine, were \$90,000, according to Stanly A. Easton, president and general manager, who states that production is being maintained at the normal rate. He says also that development on the Keating tunnel level so far has failed to locate the ore body, which faulted several months ago, but that the work is being continued. The company on Aug. 24 declared the regular monthly dividend of 3 cts., or \$78,150, payable Sept. 5 to stockholders of record Aug. 25. This will make the payments for the current year \$677,300 and will increase the grand total to \$1,560,031, or approximately 60 cts. per share on the entire capitalization of 2,605,000 shares at \$1 each.

Burke.

The terms of the 10-year lease recently acquired by the Consolidated Marsh Mines Co. on the Mono, O'Neil and Russell claims of the Federal Mining Co.'s Tiger-Poorman group, adjoining the Marsh holdings here, were made public Aug. 24, when the contract was filed with the recorder of Shoshone county. The agreement states that the Marsh Co. is to expend not less than \$40,000 developing the Marsh group and the leased holdings, such expenditures to be made under the control of the Federal Co., but the work to be supervised by the Marsh management. Operations are to begin immediately, and not less than \$2500 are to be expended each calendar month. If the Marsh Co. fails to comply with the provisions of the contract, the Federal Co. retains the right to institute action for alleged trespass of the former corporation on the grounds of the leased claims, and the Marsh officials agree to waive statute of limitations. Under the lease the Marsh shall account to the Federal Co. for milling ore on the following basis: When the milling ore contains 9% lead or less the royalty shall be 35 cts. per ton milled, and for each unit of lead above 9% the royalty shall be increased at the rate of 25 cts. per ton for each unit in excess. This rate is to apply when lead is 5½ cts. per pound New York, and when higher than 5½ cts. the royalty shall be increased at the rate of 30 cts. per ton for each cent above 5 cts. per pound, fractions proportionately. The royalty on crude ore is 15% of the net smelter returns when lead is 5½ cts. in New York, 20% when the price is 5½ to 7 cts. and 25% when the price is 7 to 8 cts. The Marsh Co.

also agrees to pay all taxes and hold the Federal Co. free from loss or damage by reason of personal injuries, liens or other encumbrances. The expenditure of the \$40,000 on development is mandatory, in order to secure the validity of the lease. The Marsh Co. also agrees and has signed an ore contract to sell all the ores to the A. S. & R. Co. Any re-organization of the Marsh Co. is bound by the agreement and lease.

Wallace.

Speculation is rife regarding the plans of the Tamarack & Custer Mining Co. relative to providing facilities for treating its output, but the management seems unwilling to give out any information, and stockholders as well as investors are in the dark as to the corporation's future policy. Since operations were begun nearly 2 years ago, following consolidation of the Tamarack & Chesapeake and the Custer companies, the output has been treated in the old Rex mill, now owned by the Rex Con. Co., but the latter has resumed possession of the plant, and production at the Tamarack & Custer has been suspended. The tramway that connected the Rex mine and mill was removed to provide transportation for the Tamarack ore when the lease was secured, but the carrier now is being restored to its former location, in compliance with the terms of the contract, and it is believed that the Tamarack properties will be idle for an indefinite period. It is rumored that the Tamarack Co. is endeavoring to purchase the Frisco mill from the Federal Mining Co., but that the latter refuses to transfer possession of the plant unless the Frisco mine is included in the sale. It is said also that negotiations are pending for purchase of the National Copper Mining Co.'s 500-ton daily capacity plant at Mullan, Idaho, recently closed down because the National Copper ore could not be treated at a profit. Other rumors are to the effect that the Tamarack Co. is seeking to secure an agreement with the Federal Co. for a permanent easement through the No. 6 tunnel of the Greenhill-Cleveland property. Not to exceed 2000 ft. of work would connect the Tamarack undergrounds with this artery, giving an outlet on both the Northern Pacific and O. W. R. & N. tracks, and eliminating the necessity for tramping the ore. The real reason for suspending operations generally is believed to be that the Northport smelter, constructed to treat the product of the Hercules and Tamarack & Custer properties, is buried with shipments, and that the congestion will not be relieved until the third furnace, now being installed, is in commission. In this connection it is said that the Northport plant's output will not be increased, as the A. S. & R. Co. is exerting its influence in the lead market to prevent the Northport Co. from marketing its product to advantage.

LAKE SUPERIOR.

COPPER.

Houghton.

Michigan is now about 46 ft. beyond the Omigah lode, or 234 ft. from the Butler lode, with its shaft and is meeting with a little copper every few feet. A fault is being encountered on one side of the drift and is consequently at right angles to the formations, which makes it easy for the men to cut out the rock. The western drift is in better rock than for the 10 days previous. The eastern drift is cutting up a stope now 30 ft. high at the top of lode, but will immediately continue the drift. The copper there is both mass and stamp. The mine is yielding a lot of the heavy mass. One piece 3000 lbs. in weight and another of about half that weight were taken out on the 22nd. This territory abounds in copper and it seems that wherever there is a crack or fissure the metal is found. From the present showing it appears quite strongly that a mine will be found here.

North Lake should at any moment enter a lode disclosed in No. 13 drill hole 47 ft. wide, with some copper and with a little in seams above and below the lode at a depth of 392 ft. This lode is the same that was found by the No. 3 hole at the depth of 1137 ft., with good copper values for 10 ft. There was also found in No. 13 hole when 1244 ft. down an amygdaloid 11 ft. thick, with copper over its entire

thickness, one piece being 3 ins. long, of solid copper. This lode will be sought by the crosscut.

Allouez's yield in refined copper is running about 20 lbs. a ton, and its tonnage is about 2000 daily, which, allowing a 9-ct. cost, would make the earnings over \$21 a share. The new ground that is being opened, both north and south, averages as good as that opened previously in these directions. Quite a large amount of new work is being done here all the time, especially at the north, where the drifts are so long, in order that they can be mined in the proper way by drifting to the boundary, with only occasionally a stope up to the level above for ventilation. The broken zone, about 200 ft. in width, a little over half way in from the shaft, is met with regularly on every succeeding level, but the mineral contents are very uniform on both sides, those of the northern side to the Ahmeek line being the better. About all the men that are needed are being secured here.

Keweenaw has been delayed greatly by the non-arrival of the timber for the trestle for the 3000-ft. flume that will bring the water to the launder, and the new wooden rockhouse, 25 by 24 ft., will all be ready to go into commission about Sept. 15. The rockhouse will not be equipped with a large bin for storage, as the mill is only a short haul from the shaft. The mill, which is that of the old Phoenix mine, has one stamp of the Ball type, Woodbury and Hodge jigs, and both Wilfley and Overstrom tables, and is capable of giving a very fair recovery. There is now a large amount of stopping ground available.

Centennial is making preparations to begin sinking the shaft from the bottom level, the 27th, to the 28th. It has been over 3 years since sinking was carried on and drifts have been carried out on every level, including the lowest, and on some at the top of the good ground just under the South Kearsarge, the 29th being the first to advance into the good rock. The drifts have reached the boundary line at the west. This work is for exploration and development, so that when enough is known of the extent of mineralization, which is averaging well under the two mines above mentioned, a large production will be made. No attempt is now being made to earn more than a small balance. About an average of 12 cars is being forwarded to the Centennial mill, as compared with 14 last year.

Hancock, being held back by the lack of men in its stopping, is sending almost 600 tons daily to the Centennial mill from its shaft No. 2. It is mining from lodes Nos. 3, 4, 8, 9, and from the Pewabic, or No. 8, and its three west lodes. All of these are yielding paying rock, but No. 4 and No. 8 are the best; the former, though averaging but 4 to 5 ft. wide, being very good and having a cost less than that of the others on account of this narrowness. An opening from the 44th to the 49th level has just been made by holing down and raising up, thus making ready five levels for sub-levels and drifting.

Copper Range is, as during last year at the Champion, putting out its largest tonnage—something over 3000 tons daily. There are now enough good men to be had, since the pay of men on company account was made \$3.50, and its yield is holding up to the very high figure of over 50 lbs. of refined copper a ton. Consequently Champion is by far the richest mine in the district. On the stretch of 3500 ft. south of No. 4 shaft the ground has been opened down to the 15th level, inclusive, all of a high average. On the 2500-ft. stretch to the north of No. 1, where the upper levels for 400 to 500 ft. had been mined with poor results, then lay dormant until about a year and a half ago, when they were pushed through high grade ground to the very boundary of the Trimountain, and where the lower levels show the same high quality right from the shaft, there is an equally good area. Between these two reaches of territory the rock, though not averaging quite so high, is good. There is no need here of resuming sinking, as so much ground is ready for drifting. The other two mines did not lose any tonnage, as there the number of men employed had varied very slightly.

Isle Royale has just completed the sinking and raising at its No. 7 shaft down to the 7th level and will now start to sink to the 8th. The ground has averaged very good and gives great promise for the south. The tonnage, in spite of the falling off at most of the mines, is still keeping up to

the high figure of over 3000 tons daily. There are being employed about 88 drills, which is about the highest number yet reached.

New Arcadian, which has sunk its shaft 120 ft. from the 1250 level, will establish the next level 250 ft. from the former, or 1500 ft. from surface. The new rockhouse and hoisting engine will not go into commission for about 40 days, from present indications.

Adventure is down 75 ft. below the 80-ft. collar and now the ledge has been cut into one side of the shaft. Every stick of the timber has had to be replaced, and the work has been difficult and slow, as it has been in sand.

Quincy has begun to build the new bathhouse for its employes, the contract having been given to Archie Verville of Hancock. This is the first step in a rather elaborate social service for the men. The building, which is located opposite No. 4 shaft, abandoned some years ago and situated between Nos. 7 and 2, will be of brick and stone 90 by 50 ft. on the ground floor, three stories high and will cost over \$20,000. On the main floor will be the showers and tub baths for the men and women, with lockers in the basement. Quarters will be provided for the caretaker on the second floor and the third will have a large lecture room, a reading room and a smoking room. Large fireplaces are planned for each of these rooms, and there will be a commodious porch for the summer time. While there is no swimming tank planned for, plans have been made so that one can be added at a slight cost.

Quincy is being inspected by President W. R. Todd and his son, Vice-President W. Parsons Todd, who is taking a great deal of the work of management off of his father's shoulders.

Mohawk has just had a survey made by its engineers of its new lands, recently purchased for the purpose of a mill site, on Torch lake, extending south to Dollar bay. This is so as to accurately know their area, and not with any immediate idea of building thereon.

Winona will not construct the proposed leaching plant, with a capacity of 5000 tons daily, for some time, if at all. Labor conditions are somewhat better, as more men are coming.

Cass has found a little copper, which is encouraging as showing that the metal is scattered over this section. The diamond drill work will make a thorough crosscut of the old Norwich, or Copper Crown, and the adjacent properties that are held under option.

Tamarack will sink its North Tamarack shaft, No. 3, to the 24th level, as soon as the loading station is cut at the 23d. The 20th level, which has been very good, with a comparatively short stretch of ground not so good, is now about 2500 ft. toward No. 5 shaft to the south, leaving about 500 more to go. This work is all on the subsidiary shaft, which starts on the 18th level. The good ground which began to extend northerly on the 20th level is widening out on the lower levels. If this stretch continues to No. 5 and to the north with depth, it will increase the profits to a considerable degree.

MISSOURI-KANSAS.

Joplin.

Lee Holden and associates have taken a lease on the old shaft at the Tomkinson land northwest of Joplin and are now sinking a shaft to open up a run of ore that is believed to extend from the Henderson land across to the Tomkinson tract.

One of the richest strikes made in the Joplin camp for some time is that of Kittrell, Jarret and Ramsey at the Yellowstone mine on East 15th street on a lease from the Missouri Lead & Zinc Co. The dirt has milled out 13% zinc over a custom mill. This was the first milling done. The general manager of the company now believes that the ore is running nearer 20%. The strike was made at 110 level, where there is a face approximately 26 ft. high. The width

is not yet determined. The strike was made in old ground which these same men had attempted to work 15 years ago. Another shaft is being sunk in order to open up the ground ahead of some dangerous old workings to not only provide safe ground, but a larger amount of face upon which to work.

The old Condor mine at Chitwood is being reopened by a group of men headed by John Mounce, Robt. Coates and Joe Rosenberg. This property was formerly worked by the Little Martha Mining Co., which had considerable difficulty, due to a hot shaft and considerable water. These conditions have been considerably abated, and the new company expects to be producing within a fortnight.

The E. Z. Eight Co. has opened up a rich run of ore on the Old Silver Dick lease at Thoms Station at a shallower level than was formerly worked. A battery of hand jigs will handle all of the free ore, while the crushed rock will be sent to a custom plant. This mine was formerly equipped with a mill, which was dismantled owing to caving ground, which threatened its destruction.

F. C. Snow and associates of Oklahoma have started up the old Gussie mill at Thoms Station with a view of operating it as a custom mill. While the plant is operated as a custom mill, some prospecting will be done in order to test out the old ground, and if possible find an extension of the run which proved so rich some time ago. This ground is known as one of the richest tracts that has ever been opened up upon the Joplin-Mexico land.

Webb City.

On McCorkle Hill the National Zinc & Lead Co. is planning the erection of another milling plant. The company already had one mill upon a 40-acre lease at this point and the development is such that it is believed another mill will be needed. This company has taken over the lease of Jasper & Wills south of their Lucky Tom plant of Porto Rico, and is now making a production of 1½ cars a week from this property, although it is not completely opened nor fully equipped. Leon Field is the field manager in charge of operations.

The Oronogo Circle Mining Co. installed a tight cable areo-tram from the open cave at No. 9 shaft to the Bunker Hill shaft, a distance of 500 ft., which is the collecting point for the surface railway which handles the ore on this property.

The Bell Mining Co. is sinking a new shaft on its Duenweg lease to open up an ore body discovered at the 140 level. Seventeen drill holes have been put down and considerable ore opened up at one shaft. The company expects to build a 300-ton concentrating plant as soon as the second shaft is completed and the ground broken up. Some of the drill holes put down on this tract assayed as high as 15% zinc. The company has a 17-ft. face of typical sheet ground.

Miami.

The Defender Mining Co. of Miami has taken a lease of 280 acres lying north of the Commerce and south of the Blue Bird and has started an extensive campaign. This company has set aside \$30,000 as an appropriation for this prospecting campaign, and if good results are shown further appropriations for development will be made. J. H. Wright of Joplin is president and general manager.

The Green Zinc Mining Co., operating on the Jones lease southwest of Commerce, is moving the Star concentrating plant to a new shaft just put down on this tract. The company is enlarging the mill and expects to have it ready for production within 90 days.

The Underwriters' Land Co. is slowly lowering the water level in conjunction with the neighboring mines and is milling ore from the upper levels, while the pumping is being done to get into the lower and richer ground.

On an adjoining lease the Lucky Kid mine has completed its concentrating plant and is now milling ores that are yielding 20% recovery zinc and lead. This concern is also adding a large sludge mill to its equipment and expects to have this part of the plant in operation within 30 days.

The Rose Mining Co. has taken over the Squaw mine at Lincolnville and while unwatering the ground is completely overhauling the concentrating plant.

MONTANA.

Butte.

According to the report for the quarter ended June 30 the Davis-Daly has been drifting to the northwest on the 2500 level and is now in about 440 ft. It has been in good ore all the way, averaging 12 ft. wide, the ore assaying between 5 and 7% copper, which is considered high-grade. The breast of this drift is still in ore. To stope this ore body the management intends to open above and below the 2500 level and crosscutting has been started on the 2400 level, where it is expected to encounter the same ore body. Ore has been mined on the 1400, 1500 and the 2500 levels. Foundation for the new hoist and building has been laid preparatory to the delivery of the machinery from the Nordberg Mfg. Co., which is promised for early in September. It is hoped that the new hoist will be in operation by Oct. 1, at which time production should be doubled from a present total of about 135 tons. Shipments for the 3 months amounted to 142 cars, aggregating 6999 tons, producing 402,813 lbs. copper and 35,478.67 ozs. silver.

A report of the Butte & Superior Mining Co., filed in the federal court here, shows that 45,874,287 tons of ore were treated in the company's oil flotation plant during July. The report is filed each month to comply with court order, for evidence in the Minerals Separation Co.'s suit against the Butte & Superior for alleged infringement upon the oil flotation patent. Concentrates recovered during the month amounted to 8,685,416 tons. The cost per ton of concentrates recovered was \$3.64. The value per ton was \$48.83.

Lehigh.

Leschen & Sons, through their Salt Lake office, are constructing an 800-ft. aerial tramway, capacity of 20 tons per hour, for disposal of waste from the coal washer of Cottonwood Coal Co., Lehigh, Mont. The line is being erected on wooden towers and wooden terminals, the discharge of waste to be into an arroyo. Automatic dumping buckets, 24 cu. ft. capacity, are carried by a ½-in. traction rope on a 1½-in. track cable.

Helena.

Silver Camp, 50 miles north of here at the head of Big Blackfoot river, is taking on new life with the nearly completed 100-ton concentrator and railroad. Copper, silver, gold, lead and zinc occur in the district, but have not been developed, because of their remoteness. With the railroad all mines will be within 5 or 6 miles of transportation. At present interest is centered in the new mill. It is expected to be in operation by Sept. 1. The concentrates are expected to be shipped by wagon to the Great Northern at Wolf Creek. The mill is being put up by Spokane and Portland capital. Engineer Johns of Spokane is in charge of the work. The new mill will reduce ore from the Mike Horse group, which is well developed and have a large tonnage blocked out. The mill will contain all the crushers, rolls and screens and similar apparatus and will also have installed an oil flotation process. Eleven cars of machinery for the mill have been unloaded at Wolf Creek, 35 miles north of Helena and five 6-horse teams are hauling the material to Silver Camp. The tunnel dumps are very large and contain values which are to be secured by the new mill. The first work of the mill is expected to be on the dumps.

The Eagle Creek property of the Scratch Gravel Mining Co. is showing good. At 176 ft. in the south incline shaft solid galena ore has been encountered that assays high in gold, silver and lead. The ore streak is said to be 1 ft. wide and is easily mined owing to the nature of the ground. The ore is all above shipping grade, assay returns giving values as high as \$150. The company purposes shipping this ore to the smelters as rapidly as possible. The formation is biotite granite and the strike of the leads is north-south.

July saw \$17,000 worth of ore shipped from the Scratch Gravel Gold Co. property. This ore was stoped and shipped during the course of development and resulted in a net profit to the company of \$8500. Since beginning operations about one year ago the company has run 4000 ft. of drifts, cross-

cuts, upraises, levels and shaft work. The main incline shaft is now down 400 ft. on the incline. Good ore predominates. It is mostly of a bunched character, but high grade. At 365 ft. good gold and silver was found which assayed \$96.95 to the ton without counting the copper content, which is considerable. Drifting is now going on in the 200 level west and the 300 east. A drift is being run between the 200 and 300 levels to the west. The quartz found in the main shaft is of the same character as that heretofore mined, but shows more copper than has been encountered. No assay was made of the copper content of the ore.

Basin.

Walter Harvey Weed, in charge of the Crystals group, says: "Conditions are looking good at the mine, as I have cut good shipping ore in the hanging vein up to the stope. Also in the face of the upper tunnel on the vein good ore comes up half way in the face and it looks to me as if this was going to make a good shoot in the bottom of the tunnel, as sulphide ore comes up half way from the bottom of the drift, and it is oxidized on the back of the drift. I am going to put on the night shift of more men stoping out ore, beginning Aug. 29 so that I can get out all the ore possible. The samples taken from the ore in the stope show 4 to 8% copper, 8 to 16 ozs. silver. The new ore cut on the foot-wall side of the vein is better grade. The sample assayed 8% copper and 13 ozs. silver. In the lower crosscut tunnel we have made 65 ft. advance during the month, which is not bad, considering the excessive hardness of the rock. It is a hard, silicious aplite in which talcines are now coming in. I am shipping ore steadily and expect to continue. Am expecting to make new contracts for supplies with a saving of about 20% over prices paid at Basin."

NEVADA.

Goldfield.

Ore averaging around \$30 per ton has been uncovered at an approximate depth of 1000 ft. in the Silver Pick mine, and developments are proceeding to determine its extent. The discovery was made in the shale-latite contact and is considered highly important. The shaft will be continued to the 1200 level and the shale-latite contact prospected. A large pump has been installed to keep the mine clear of water. The Calyx drill has penetrated to a depth of 1500 ft. without intersecting the shale, which apparently dips sharply at this point.

The 1000-ton flotation unit of the Goldfield Con. went into commission Aug. 21 at full capacity. As soon as the machinery has been in operation a few weeks the management expects to maintain a daily output of 1050 tons and to better the gold extraction, which now approximates 92%. Concentrates will be treated at the local plant of the company. Extensive developments have been resumed in the lower levels of several of the mines, where important reserves of copper-gold ore are indicated.

The Jumbo Extension Co. has passed its usual quarterly dividend, and it is stated the company is arranging to acquire another producing property. President Sprague states recent developments have been unsatisfactory and that unless new ore bodies of importance are soon opened the life of the Jumbo Extension will not be long. Some promising ore is showing in the new Velvet workings, but it will require \$100,000 to finance the development campaign outlined by Consulting Engineer J. K. Turner. Cash reserves are stated to exceed \$200,000.

The flotation plant of the Florence-Goldfield Co. is treating in excess of 200 tons per day. A new flotation machine, the Jones-Belmont, is being used with satisfaction. The product now going to the mill averages \$5 per ton, but a higher grade ore will soon be treated. This product is being mined on the 530 level and assays \$25 to \$35 in gold, silver and copper, with gold predominating.

Hornsilver.

The Hardwick-Reid lease on the Orlean mine has opened rich ore at a depth of 100 ft. The shoot averages 2 to 3 ft. wide and assays \$80 per ton in silver and gold. In the foot

wall a seam of ore assaying 1700 ozs. silver and 5 ozs. gold is exposed. Shipments of the rich ore have begun and indications favor development of a heavy tonnage of shipping material.

The Horn Silver Mining Co. has installed a 40-hp. electric hoist and is preparing to sink the main shaft several hundred feet below its present depth of 500 ft. On the 100 level extensive work has been prosecuted during the past 6 months and large reserves of milling and shipping ore exposed. Several distinct veins have been demonstrated and will be opened at depth.

Goodsprings.

The Pocahontas group of 7 claims, located between the Yellow Pine and Red Cloud mines, has been taken under bond for \$50,000 by Fred W. Cole and D. W. Minier of the Azalia Mining Co. The tunnel is in 300 ft. and a 25-ft. shaft has been sunk in ore. It is intended to provide more equipment and to send the shaft deeper.

Lynn.

The Big Six Mining Co. is sending shipments of rich ore to Utah smelters, and is preparing to provide reduction facilities at the mine. A large tonnage of good grade gold-bearing quartz has been blocked out, and the property is showing well with deeper work. W. W. Ruby is manager.

The Bull Moose Mining Co. has granted a 2½-year lease on its holdings to a group of Colorado, Idaho and Montana people, and extensive work will start immediately. The lease covers 4 claims adjoining the Big Six group on the north. The Bull Moose Co. is controlled by Salt Lake people. W. E. Barney is president.

Austin.

At the Austin-Dakota a station is being cut at the 260 level and sinking of the shaft is progressing rapidly with 3 shifts. The Tesora incline shaft is being deepened and several drifts extended from the Double H tunnel. A considerable amount of new equipment has been recently installed and developments are proceeding at low costs. Good ore is stated to be showing at several points. The company is composed principally of eastern people. C. F. Littrell is manager.

The H. M. Byllesby Co. is erecting a tungsten plant at Toulon, where rich deposits of scheelite were recently discovered. An excellent camp has been established and water developed near the mine.

Golconda.

The new 20-stamp mill at the Kramer Hill mine is about to go into commission. A test run of the plant has been made, and ore is being delivered to the bins. Large reserves of excellent-grade ore have been blocked out and the management anticipates a long period of profitable production. The ore is largely gold-bearing.

Developments have been resumed in the Adelaide copper mine, under management of Charles Kirchen. The Adelaide is located in Gold Run basin, 12 miles from Golconda, and is controlled by John G. Kirchen and associates of Tonopah.

Elko.

Representing New York interests Alfred Millard has taken under option the Lucky Girl silver mine at Edgemont, and is preparing for extensive work. The tunnel is in 4000 ft. and is expected to intersect the main ledge within 300 ft. On the 800 level the ore body is 30 ft. wide with values averaging around \$10. The tunnel is designed to intersect the ore at a depth of 1300 ft. Overhauling of the old mill has started and crushing will soon be resumed.

Athens.

Arrangements have been made to install a 50-ton mill at the Royal George mine and it is expected the plant will be in commission early in October. It is estimated ore reserves to the value of \$1,000,000 are blocked out. Fred Siebert is superintendent. Three miles south of the Royal George lies the Turner & Harvey group, which has been purchased by Adams & Miller of Mina. Good ore is exposed and considerable development is going forward.

Winnemucca.

Developments are proceeding at the Wolverine copper-gold-silver mine with encouraging results. The main shaft, equipped with a hoist, is down over 100 ft. and No. 2 shaft is

down 50 ft. Both are in ore of excellent grade. The Wolverine claimed original attention because of its copper deposits, but at depth large bodies of silver-gold ore have appeared. Rich copper ore continues to show at several points.

Dayton.

The Rae Con. Gold Dredging Co. is installing a small dredger to operate on 609 acres in this section. The ground has been thoroughly tested and is stated to average high in gold. It is expected to start operations by Oct. 1.

Luckyboy.

The A. Miller lease on the Lucky Boy mine has struck a shoot of rich ore between the 800 and 900 levels. The shoot forms part of what is apparently a new vein and is 4 ins. wide; 14 sacks of ore assaying around \$1000 to \$2500 in silver have been taken out.

Jungo.

A copper discovery of considerable magnitude has been announced from the Jackson mountains, 32 miles from Jungo. The ore lies in a formation of monzonite porphyry and has been traced for a length of 12,000 ft. and width of 1800 ft. There are two distinct ore bodies, one carrying gray carbonates. Assays range from 1 to 15%. Shipments of selected ore to Jungo have begun, and arrangements made to install a 50-ton reduction plant.

National.

The tramway from the Hatch lease on the Buckskin National to the new mill has been finished and the plant is about ready to go into commission. The lease continues to open excellent grade ore.

NEW MEXICO.

Mogollon.

Work on the Good Luck group was recently resumed by the owners, Messrs. Lauderbaugh & Thorlston. A 250-ft. crosscut tunnel encountered the contact at depth of 170 ft. and it is understood the showing is very satisfactory. The location of the group is such as to give it a promising future, being bounded on the north and east by the Confidence. Last Chance and Leadwood properties, on which are a continuous series of ore channels for about 2 miles in length. These collectively have produced several million dollars. The Gold Dust group lies just south of it and while this latter is one of the newer properties it is well thought of.

During first half of August the Mogollon Mines Co. treated 2013 tons of ore, producing 1600 lbs. of gold and silver bullion and several tons of concentrate. The first section of tailings flume has been completed and is now in commission.

The Oaks Company milled ore from both the Eberle and Clifton mines the past week.

Flotation experiments conducted by one of the local mills indicates that the ores from the northern end of the district will yield a high extraction. Whether or not the balance of the camp will be helped by this method has not yet been determined. Careful tests are being made under various conditions with the hope of improving on the cyanide process.

It is understood that the Pelton Water Wheel Co. has the contract for the new hydro-electric plant about to be installed on Mineral creek by the Mogollon Power & Lumber Co. This is being watched with great interest by the mining operators, and, if it proves a success, other plants will undoubtedly be established in the near future and do away with the long oil haul from Silver City. Water readings are being taken regularly on two other power projects which, when put in, will supply the entire camp with cheap power.

OREGON.

Waldo.

The Sammons-Cameron-Logan mine has recently made a clean-up of 484 ozs. in three bricks valued at \$9000, which

was sent to Grants Pass. It is reported that the balance of the clean-up, disbursed in other channels, will bring the grand total up to \$14,000. Thirty-four days of actual labor are represented in the making of this return. This old hydraulic deep-gravel mine has been a steady producer for over 50 years.

Greenhorn.

The Bi-Metallic mine is in course of examination by Montana parties. The Roberts' mill is running on West Side ore. The Morning mine is milling ore. Assessment work is being done on quite a number of properties in the district. The Psyche is getting out shipping ore and sorting out mill dirt of good grade. S. C. Richardson is doing development work at his Tiger property. A number of outside prospectors are in the hills and are much encouraged by what they are finding.

SOUTH DAKOTA.

Custer City.

The Puritan shaft has been unwatered and work on a large scale will soon be started. It is found that the timbering in the shaft for a depth of at least 75 ft., will have to be replaced, and, it is possible, to a greater depth. After the necessary repairs have been made to the shaft the real development will start. Then it is expected to use two shifts and rush the work. There will be plenty of funds for the new work, which will be done with the object of opening up the vertical vein in the property. The boilers, compressor and hoist have received a thorough overhauling and are as good as new. The work which has been done on the mill has left the plant in good shape and ready to start on the treatment of ore at any time.

Trojan.

Intending to stimulate mining the Trojan Mining Co. is entering into a new plan with respect to customs work at its mill. The mill is situated in the Bald mountain district, and facilities will be installed for receiving ore over any of the railroads entering the camp. This will give the plant an opportunity to bid for the ores of that district, and moderate freight rates now in effect, will make it possible to ship from considerable distances. At the mill is a separate ore bin of large capacity into which the various lots of custom ore will be dumped. After crushing they will be conveyed to an automatic sampler, that by repeated tests has been found accurate. As now outlined the plans of the company will be to examine the ores offered, make preliminary assays and cyanidation tests to ascertain the value and amenability of shipments, and then purchase the consignments. Everything possible will be done to assist the shippers, as the company desires to encourage steady and regular shipments, large or small. The entire staff of the company will be at the service of the shippers and the mining department will consult and help in any way possible.

TEXAS.

Alpine.

An inspection of the Maraposa cinnabar mine in the Terlingua district was recently made with the view of its purchase by a syndicate of Chicago men, headed by Lawrence Sawtelle. This mine was formerly a large producer of rich cinnabar ore, but a flooding of the lower works caused a cessation of operations. It is believed that by installing pumps of moderate capacity the flow of water can be controlled and the work of getting out the ore resumed.

Considerable progress has been made during the last few weeks in reviving quicksilver mining operations in the Terlingua district, situated 90 miles south of here. Under the protection of the large American military forces that are stationed at various points in the Big Bend region the mining of cinnabar ore and its treatment in furnaces has been resumed on a more extensive scale than for several years.

The Colquitt-Tigner mine, which was closed a few years ago, has been taken over under an option and bond by Henry Hill of Clifton, Ariz., Marlow Wells and David Grough. The first run of 10 flasks of quicksilver obtained since the new operators obtained control of the property was recently shipped to market. Considerable machinery, including diamond drills, will be installed and the large area of ground that is embraced in the mine will be thoroughly prospected. An additional furnace will also be installed, it is stated.

The Big Bend cinnabar mine which is owned by the Sangers of Dallas and Waco was also flooded several years ago and has been out of commission since then. It is reported that it is to be equipped with pumps and the mining resumed.

The principal quicksilver production of the district comes from the mine and furnaces of the Chisos Mining Co., which have been in uninterrupted operation for several years.

UTAH.

Cottonwood.

According to J. M. Howell the new power drills enable the Big Cottonwood Con. tunnel to progress at the rate of 8 ft. a day with two shifts, as compared with 8 ins. when the work was by hand. The new boarding house has been completed, giving ample accommodations for the men. The company has raised for 500 ft. in ore and had also sunk 500 ft., making a total of 1000 ft. in ore. At the Howell property of which Howell is a director, they are sinking on a 3-ft. vein of ore in the quartzite that was showing considerable shipping ore. This is showing an improvement as depth is attained. The company has 11 men at work and already has a shipment ready for the market.

The Cardiff is now hauling ore with six Packard trucks. The trucks are used in connection with the caterpillar tractor outfits pulling six trailers each. The Packards are hauling about 5 tons to the load. They make two trips daily. The movements of ore is so irregular these days that one of the directors of the Cardiff would not even venture a guess at the amount of the average daily tonnage going to the Murray smelter.

At the Woodlawn Mining Co.'s property a new tunnel is in 485 ft. From this an incline is being sunk on a good showing of ore. The new adit is being run to prospect a large ore body opened in the old workings. There is one tunnel in 1000 ft. These workings have been for 300 ft. in zinc, where it is 16 ft. wide in places. It has also been sunk on for 180 ft. Some new work is sinking 90 ft. in a winze where there is a showing of galena. Samples of this carry up to 64% lead and 42 ozs. silver; another 50.9% lead and 14 ozs. silver. In one place there are five small bedding planes showing ore, which look promising for further exploration. In another place is a foot of solid galena in a vein 2 to 3 ft. wide. This work is about 375 ft. vertically from the surface. From the big zinc body of ore a shipment averaged 27% zinc, 16 ozs. silver and 7% lead. A recent estimate of the tonnage was placed at 5000 tons that was thought should hold up to 20% zinc, 15 ozs. silver and 6% lead. The Woodlawn owns nine patented claims. It is mainly on the Big Cottonwood side of Honeycomb gulch and adjoins the old Prince of Wales mine. A lease has been let to miners, who have started opening a surface ore shoot, where they find ore carrying 12.5% copper. Three men are now working there.

Eureka.

Chief Con. has made another strike on the 1200 level. This is considered the most important find that has been made since the opening of the deposits on the 1800 level. The 1200 strike is 300 ft. away from the other ore bodies of the mine and this fact adds greatly to the importance of the discovery because it brings in virgin ground. After drifting through the ore deposit for about 20 ft. stoping operations were taken up and the ore body has all the appearances of permanency. The ore as it is now being broken down for shipment will carry \$35 to \$10 in lead and silver. Down on

the 1800 level there is one of the largest ore bodies that has ever been opened in the property, which is now contributing a good part of the mine's output. The 1800 ore body is a recent discovery and work which has already been done shows that this extends far above the 1800 and below this point. A short distance below the 1800 level water was encountered and no effort has been made to follow the ore below that point.

The Tintic Milling Co. has recently sent out a \$24,000 shipment. It represents a partial cleanup of the mill, which is now running along in a much smoother manner than heretofore. Mining men of the district are of the opinion that the problem of treating the low-grade silicious ores of the district has been solved. The mill is now treating 100 tons of ore per day and as soon as the Holt-Dern roasters that have been ordered arrive from the factory the capacity of the plant will be brought up to 300 tons. The new roasters will replace the Knight-Christensen roaster. With the heavier tonnage, the costs of operations will be decreased. From 170 to 190 cars are being shipped each week from the Tintic district. A recent week's output by cars is given as follows: Dragon Con., 38; Chief Con., 34; Mammoth, 18; Centennial Eureka, 15; Gemini, 14; Grand Central, 14; Iron Blossom, 14; Eagle & Blue Bell, 9; Gold Chain, 6; Bullion Beck, 3; Godiva, 3; New Bullion, 3; May Day, 2; Lower Mammoth, 2; Colorado, 2; Utah Minerals Concentrating, 1; Uncle Sam, 1; Yankee, 1; Colorado, 1; Scranton, 1; Tintic Milling, 1; Minnie Moore, 1; Swansea, 1; Governor Mining, 1; total, 188.

Garfield.

The sulphuric acid plant in connection with the smelter here will start in a few days. The new plant was erected by the American Smelting Co. and Utah Copper interests. The capacity of the plant is 100 tons daily. It is said that the entire output has been contracted for already. It is said by experts that the sulphuric acid issuing from the stacks of the four smelters amounts to 400 to 500 tons daily. Where these and the arsenic acids settle on farm lands in the vicinity of the smelters the farmers claim to have lost crops and many animals feeding upon them, causing many suits in the courts.

Salt Lake.

At Atkinson station, 22 miles from here, the Big Four Exploration Co.'s plant is being brought to capacity and 2 cars have recently been shipped. There is now being treated at the plant approximately 600 tons of tailings per day. It must not be understood that the plant is as yet not working continuously. As with all large concentrating mills, it has been found necessary to make certain changes of a minor character, which changes have resulted, up to date, in closing down the mill from one to two shifts per week and at times for longer periods. It should reach its capacity of 750 tons per day within a very short period. The plant was built to treat a tailings dump that is 3½ miles in length, from 20 to 900 ft. in width, and from 5 to 8 ft. deep. There are approximately 1,030,000 tons of material on which the company has a lease that runs until 1924. Average samples of the dump show it to contain .015 oz. gold, 3.2 ozs. silver, 1.6% lead and 4.1% zinc. Lead-silver-zinc concentrates are being produced. It is believed from the numerous tests that have been made, that better than a 60% extraction of marketable zinc concentrates, 50% lead extraction, 35% extraction of the silver-gold content, and a good silver-lead extraction is being made. Based on silver at 50 cts., lead at 4 cts. and zinc at \$5.40, a profit of \$14.625 per month will be made, assuming the total costs to be \$1.30 per ton. The concentrate produced at present, figured at the low metal prices mentioned, is worth \$1.95 per ton.

WASHINGTON.

Spokane.

The Fern Cliff group is being operated by F. G. Robertson, who is paying attention to the tungsten ores which occur in it in the form of scheelite and wolframite. He is opening up one vein in which the wolframite is from 18 ins. to 4 ft. wide. A shipment of ore from the property a short

time ago netted a good profit, so he is continuing development. There is accumulated considerable rich ore on the dump and he is preparing to make another shipment. The Fern Cliff is one of the first properties in the Black Hills from which tungsten was shipped. From the workings on the ground a 9-lb. crystal was recently taken which gave an assay of 63%. The vein matter is heavily impregnated with tungsten crystals.

The Cuyahoga group, on which Frank H. Gira has been doing considerable work, is now preparing to unwater the main shaft, and has a station cut for a pump, which will soon be installed. He has made arrangements to have shipped to the property some necessary machinery, and when it is installed the work will go ahead fast. Interested in the property with Mr. Gira are a number of Cleveland, O., capitalists.

Chewelah.

An 8-ft. vein has been opened on the 150-ft. level of the June-Echo, and drifts 30 ft. long in either direction indicate an extensive shoot of copper. The vein has been stripped for 100 ft. on surface. Assays run from \$18 to \$132, and the average is \$30. The June-Echo was located 36 years ago by W. E. Imbrie and E. W. Kelly, who developed the holdings at intervals for several years, sinking a number of shallow shafts on two parallel veins that traverse the claims about 400 ft. apart. It was relocated several times before coming into the possession of the June-Echo Co. 2 years ago. Since then development has been prosecuted continuously, and it is said that a 300-ft. shoot has been proven. Equipment consists of a compressor, hoist and a 25-hp. steam plant. The management has announced that the shaft will be continued to the 500 level. Shipments of crude ore will soon begin to the Granby smelter, and plans are under consideration for the erection of a concentrator to handle the low grade.

Boundary.

To Aug. 1 1000 tons were shipped from the Electric Point mine and now are shipping 100 tons daily. Of the product already sent out about 50% was clean galena, averaging 75% lead. The shipments of carbonates were begun only after the shipping bins had been filled and it became necessary to load directly into cars. The 3½-mile wagon road to the mouth of Silver creek is in splendid shape for heavy hauling, and eight 4-horse teams and a motor truck with trailers are employed.

WISCONSIN-ILLINOIS.

Platteville.

Important developments are being made in the zinc mining industry of this field by the Wisconsin Zinc Co. H. C. George, who lately succeeded H. S. Snow as General Manager, has under his charge 450 employes and the full working force by Jan. 1, 1917, it is said, will exceed 600. Five producers and two magnetic separating plants are operating full time. Two new mines have been developed and are now being equipped. In the Platteville district the East End mine has run its course, the supporting pillars are being pulled and the mine will be abandoned. The Empire Separator which operated most successfully for years and was only recently shut down on the completion of the new \$100,000 separating plant at New Diggings, has been sold to the Fields Mining & Milling Co. of Chicago and will be removed to the company's mines at Shullsburg. Two new mining and concentrating plants are well along toward completion in the New Diggings camp for the Wisconsin Zinc Co., one on the C. A. Thompson mine and the other on the Longhorn allotment. The C. A. Thompson mine and mill will be running full head by Sept. 15. The Longhorn it is reported will not be ready for service until about Nov. 1. On the C. A. Thompson, the shaft just completed at a depth of 160 ft. has gone through 40 ft. of solid zinc formations.

In the New Diggings district the Wisconsin Zinc Co. has in operation 10 drilling machine squads the Keystone type of drill prevailing. The Champion mine, owned by the com-

pany and located here, is producing 250 tons of 36% concentrate weekly. At the Skinner Separating Works, more than 1000 tons of green concentrates are refined weekly, sales of the high grade finished product being made in open market. In the Shullsburg district the Winskill mine continues production of zinc in volume shipping an average of 5 to 7 cars weekly. This ore is coming from the lower level in the glass rock strata and was developed about a year ago as the company was on the point of throwing up the mine after several years successful operation. In this district and between Benton and Mill Brig, Ills., 4 miles north of Galena, Ill., 10 more drilling machines are engaged by the Wisconsin Zinc Co. In the Galena district the Federal mine producing indifferently for 2 years is now in prolific soil and has been placed on two shift basis, making 100 tons of 44% zinc per week. The ore is coming from the Andrews land east of the mill. Two weeks ago a new producer was ushered in for the company on the Birkbeck farm. Here a new 200-ton rig is operating with gyratory crushers. The new mine and mill is 1 mile south of Day Siding, Ill., and 75 men are required on double shift. Heavy lead and sprangled zinc is found in the glass rock; disseminated sheet ore in the oil rock and sheet deposits in the blue ground. The output is 150 tons of 50% zinc per week. The initial car assayed 52% zinc content. Mining and milling costs have been brought down at all points to about \$1.50 per ton hoisted. Cost of materials or mining supplies are 25% higher than 2 years ago. The Joplin Separator plant now owned and controlled by the Wisconsin Zinc Co. is turning out an average 60% zinc. The Skinner plant at New Diggings is running at maximum efficiency and is making from 58% to 60% ore. The introduction recently of the Whaley type of electric shovel by the Vinegar Hill Zinc Co. at the Martin mine is meeting with favor and one of the same type will be installed at the Champion mine in September. Others are contemplated for other active producers. The Wisconsin Zinc Co. is now on a sound dividend paying basis of 8% per annum on stock of issue, the 2nd dividend going to shareholders of record July 29th, 2% payable each quarter.

Returns for the entire field for week of August 26th showed deliveries to track of 154 cars of zinc ore, 6271 tons. No shipments of lead ore were reported. Shipments of pyrites for the week totaled 1,550,000 lbs. The gross recovery crude concentrate from all mines amounted to 4851 tons; net to smelters 2295 tons. The Mineral Point Zinc Co. shipped 13 cars high grade refinery ore to smelter at De Pue 533 tons. The base price on zinc ore showed slight improvement top and standard zinc ore going at \$59 per ton basis down to \$53 for medium grades. Platteville district showed light shipments 2 cars coming from the East End mine 88 tons; Hodge mine to Cuba 3 cars 129 tons; Block-House 1 car refinery product (high grade) to Illinois Zinc Co. 44 tons.

Benton.

This district maintains its position as the banner ore producing camp of the field. Returns for Aug. 26 show deliveries to track of 59 cars of crude ore, 5,234,000 lbs. Among new producers the Wilkinson Mining Co. sent 4 cars to National Separators, 166 tons, one week's turn-in. The Champion mine delivered 11 cars to refineries at Galena, 451 tons; Vinegar Hill Co. to Cuba 11 cars, 473 tons; New Jersey Zinc Co. to Mineral Point 12 cars, 576 tons; Fields Mining & Milling Co. to Galena 7 cars, 320 tons; Frontier to Grasselli Chemical Co., 5 cars, 203 tons; Wis. Zinc Co., high-grade refinery ore to American Zinc Co., Hillsboro, Ill., 7 cars, 288 tons; Lanyon Zinc Co., 42 tons; Eagle-Picher Lead Co., 2 cars, 64 tons. Longhenry Bros. reported 1 car. Sally Mining Co., another new producer, 1 car.

Mineral Point.

Receipts of raw ore at the refineries of the New Jersey Zinc Co. last week totaled 42 cars, 1656 tons. Only 6 cars of this lot came from Independent operators. Mineral Point locals delivered 1 car to furnaces, 24 tons. The O. P. David mine at Montfort shipped 2 cars last week to La Salle, 83 tons.

Galena.

Twenty cars out last week, 25 cars the week before, show this district improving. The Sandoval Zinc Co.

shipped 2 cars to the Galena Refining Co., 80 tons; 3 cars to Edgar Zinc Co., 122 tons; Black-Jack mine to Mineral Point, 6 cars, 237 tons; Little Corporal, a new producer, to Grasselli Chemical Co., 42 tons; North Unity to Cuba, 42 tons; Wisconsin Zinc Co. to La Salle, 5 cars high-grade, 200 tons. A number of new producers with new rig and in going shape did not report and several hundred tons of concentrate were carried over.

Cuba City.

The National Separators received 21 cars of crude ore last week, 880 tons; 6 cars of this lot came from independent operators. Shipments of high-grade refinery product were made to Illinois Zinc Co., 267 tons, and to Granby Co., 124 tons. Utt-Thorne Mining Co. shipped 3 cars of crude ore to Benton Roasters, 126 tons. The Big Eight, Anthony, Gritty-Six and Dall mines are all new producers.

Shullsburg.

The Winskill mine, one of the Wisconsin Zinc Co.'s string, delivered in connection with current output last week a large amount of reserve ore, 15 cars in all, 617 tons being delivered to the company's magnetic separating works at Galena.

WYOMING.

Lander.

The Greybull Oil & Development Co. is sinking a well on the south side of the Greybull river. It has purchased of G. M. Booth and A. J. Rankson of Basin, Mont., the 66-acre tract formerly owned by Saul Alderice, which joins the property of the Greybull Co. on the east. The consideration was \$10,000. The big well brought in recently by the Northwest Co. is within 40 rods of the tract purchased by Edward Bros. of Greybull. The company will sink two test wells on the tract within the next 60 days. If they are successful in bringing in a good well, they will sink a number of wells, possibly 10, on the property, as the ground is in a section that is surrounded by wells. The work of the construction of the addition to the refinery is almost completed. In a week or ten days the entire plant will be in operation. The three power stills are already in operation and the six furnace stills are nearly completed. The workmen are setting up the last of the big boilers that were added in order to supply more power for the increased plant, and the masons have nearly completed the laying of the brick around the stills. The increased number of stills will more than double the capacity of the plant which has been running at high pressure in order to meet the demand that has been made on it for its product.

Nine big storage tanks have been set up by the Greybull Refining Co. since they acquired the refinery from the Big Horn Oil & Gas Co., and two more are to be added. Two are of 55,000 barrels capacity, four of 15,000 barrels, two of 25,000 barrels and one of 38,000 barrels. The tank men are busily employed constructing the other two.

CANADA.

BRITISH COLUMBIA.

Ainsworth.

Rapid progress is being made installing the new equipment at the Florence Silver Mining Co.'s property, and 70 men now are employed in construction and development work, according to Ferd R. Wolfe, president and general manager, who recently returned from a two weeks' visit at the camp. "Grading for the hydro-electric station has been completed, and the concrete foundations have been placed. The equipment for the plant already is on the ground, except the water wheel and the wire for the transmission line, and these will be delivered soon. The building for the 250-ton daily capacity mill is about half completed, and much of the machinery is on hand and ready to be installed. The Broderick & Bascom Rope Co. of St. Louis, Mo., has been awarded the contract

for constructing the 1400-ft. two-bucket aerial tramway that will connect the main lower tunnel and the concentrator. The carrier will cost about \$10,000 and will have a capacity of 20 tons of ore an hour. There are about 200,000 tons of ore available for extraction in the present main workings as soon as the mill is ready to operate, and the new lower tunnel, which is being driven by contract at the rate of 10 ft. daily, now is about half way in to a point immediately below and 330 ft. deeper than the bottom of the winze, with which it will be connected with an upraise. We also are continuing the No. 2 tunnel to get under the Twin ore shoot at a depth of 1200 ft. This working now is in about 2200 ft. and will reach the objective in about 500 ft. more. Recently I received smelter returns from the last 2 cars of concentrates shipped from the Highland mill before we surrendered it to the Consolidated Mining & Smelting Co. of Canada, from which we had it leased. One car went 50% lead and 12 ozs. silver, and the other 59% lead and 18 ozs. silver. The average net value was \$60. We have just shipped 2 cars of crude ore that was extracted in development, the consignment weighing 82 tons that average 65% lead and 25 ozs. silver. We estimate that the net returns of the lot will be approximately \$5500."

ONTARIO.

Cobalt.

Detroit capitalists have secured a lease on the Little Nipissing ground. A company will be formed, but in the meantime work will be commenced. A start will be made right away in pumping out the old shaft and workings. J. W. Wilson is in charge of the work. The old shaft is down approximately 230 ft. and about 2000 ft. of drifting and cross-cutting has been done. The old company during its career shipped considerable high grade and several carloads of low grade, but when their finances ran out the work was suspended and the lease expired. The location adjoins the Nipissing on the east and is close to the Seneca Superior lease.

With Callow machines Nipissing has decided to increase its flotation plant to 500 tons capacity and treat all tailings from the all-sliming cyanide process. The results of experiments showed a profit per ton sufficiently great to warrant enlargement. At the Coniagas a 100-ton plant will be installed. The machinery and other equipment has been ordered and the plant, it is expected, will be in operation in about 6 weeks. The latter plant will be along the lines of the one installed at the McKinley-Darragh and will be operated behind the tables. Tanks will not be put in for the present at least and the slimes will run direct to the mixer and then to the coils. The Coniagas will, it is thought, make an additional recovery of from 3 to 4 ozs. with flotation.

The Dickson Creek Mining Co. are going ahead with mining operations as soon as the compressor arrives. The buildings completed are a transformer house, hoist-house, equipped with a 75 hp. motor, a headframe 30 ft. high, and a general workshop. The shaft is down 84 ft. and is sunk on a vein on an incline of about 80 degrees. The size of the hoist is 6 by 8 ins. It was expected that the plant would be in running shape at a fairly early date but the company has been held up on account of delays in the shipment of machinery. A 2000 gallon water tank has also been installed on the property.

The shaft at the Genesee mine is now down 194 ft. At a depth of 187 ft. a slate sill 18 ins. thick was cut. An assay taken from the vein gave 25 ozs. silver. The vein is from 2 to 3 ins. wide. At the annual meeting of the company the following were elected to the board: President, R. H. Gorsline; vice-president, C. F. Crandall; secretary-treasurer, Alexander Russell; managing director, L. F. Steenman; director, C. D. Van Zandt.

Boston Creek.

R. H. Lyman has let a contract to E. W. Asselstine for the sinking of a shaft on the Boston-Hollinger property. At the same time a large gang will be started stripping and trenching on other parts of the property in order to get a line on the extent, number and direction of the veins. The foregoing property consists of the two claims recently optioned from Ben Hollinger and associates.

World's Index of Current Literature

A Weekly Classified Index to Current Periodical and other Literature, Appearing the World Over Relative to Mining, Mining Engineering, Metallurgy and Related Industries, in Four Parts.

Part 1. *Geology*—(a) Geology; (b) Ore Genesis; (c) Mineralogy.

Part 2. *Ores and Metals*—(a) Metals and Metal Ores; (b) Non-Metals.

(II) NON-METALS

(A) FUELS

Coal Fields and Mining

Brooks, Alfred H.—*The Alaskan Mining Industry in 1915*. [Reviews the production and conditions in different districts with information on coal and metal mining law].—U. S. G. S. Bull. 642-A; pp 71*.

Campbell, M. R.—*Half Century Life of Coal Supply*. [Abst. from a U. S. G. S. report].—Coal Tr. Bull. Aug. 15 1916; p 40; pp 2½; 25c.

Crankshaw, H. M.—*Mining and Ventilation Methods in Thick Pitching Beds*. [A paper to be read at the A. I. M. E. Arizona meeting].—Coal Tr. Bull. Aug. 15 1916; p 23; pp 5*; 25c.

Crider, A. F.—*The Coals of Letcher County, Kentucky*. [Geology is taken up in detail and the different coal beds are described separately].—Kentucky Geol. Surv. Vol. VI; Ser. VI; pp 234.

Fay, Albert H.—*Coal Mine Fatalities in the United States, May, 1916*. [The nature, number and location of the accidents are given in tabulated form].—U. S. Bur. of Mines Monthly Statement; pp 28.

Lee, Wallace.—*Geology of the Kentucky Part of the Shawneetown Quadrangle*. [The economic deposits are composed of coal, oil, lead, zinc and clay].—Kentucky Geol. Surv.; pp 73.

Lishman, G. P.—*Recent Improvements in By-Product Coke Oven Practice*.—Jnl. Soc. of Chem. Ind. July 31 1916; p 767; pp 3*; 50c.

Louis Henry.—*Waste in Coal Production*.—Jnl. Soc. Chem. Ind. July 31 1916; p 770; pp 3½; 50c.

Lupton, Charles T.—*Geology and Coal Resources of Castle Valley in Carbon, Emery and Scvier Counties, Utah*.—U. S. G. S. Bull. 628; pp 88*; 30c.

—*Rapid Gain in Coal Movements Over Heaviest Railroads*. [Abst. from a U. S. Dept. of Commerce report].—Coal Tr. Rev. Aug. 15 1916; p 44; pp 2; 25c.

Natural Gas

Shaw, Eugene W.; Matson, George C.; Wegemann, Carrol H.—*Natural Gas Resources of Parts of North Texas*. [Describes the geology and the various operating fields, with some of the various methods they employ].—U. S. G. S. Bull. 629; pp 129*.

Wolf, Fred L.; Burr, Robert B.—*Tests of Natural Gas Fired, Brass Melting Furnaces Under Factory Operating Conditions*.—Trans. American Inst. of Metals Vol. IX; p 343; pp 24*; 35c.

(B) STRUCTURALS AND CERAMICS

Cement

Burchard, Ernest F.—*Cement in 1915*. [Takes up different phases of the market separately and gives curves in some instances, with the production in each case].—Min. Res. of U. S. II:16; pp 24.

—*Six Months of Wonderful Prosperity for United States Mining*. [Reviews the first half of the year's production].—Mg. World Aug. 5 1916; p 229; pp 8¼*; 10c.

(C) OTHER NON-METALS

Acids

Mason, F. H.—*Synthetic Nitric Acid*. [A general review of theory and practice in manufacturing].—M. & S. P. Aug. 19 1916; p 265; pp 2; 20c.

Parr, S. W.—*The Development of an Acid Resisting Alloy*. [The alloy con-

tains nickel and chromium, with many other ingredients in small quantities].—Trans. American Inst. of Metals Vol. IX; p 211; pp 7*; 35c.

Stander, H. J.—*The Function of Oil and Acid in Flotation*. [Describes tests and theory, bringing out the principles underlying flotation].—Mg. World Aug. 19 1916; p 317; pp 3¼*; 10c.

Turner, W. A.—*The Separation of Vanadium from Phosphoric and Arsenic Acid and from Uranium*. [A description of a chemical method].—American Jnl. of Sci. Aug. 1916; p 109; pp 2; 60c.

Bitumens

Northrop, John D.—*Asphalt, Related Bitumens and Bituminous Rock in 1915*. [Reviews the production and industry for United States and foreign countries].—Min. Res. of U. S. II:13; pp 16.

Stenart, D. R.—*The Shale Oil Industry in England*.—Jnl. Soc. of Chem. Ind. July 31 1916; p 774; pp 2½; 50c.

Miscellaneous Non-Metals

Robinson, Heath M.—*Ozokerite in Central Utah*. [Treats on the geology, genesis and tests for determining the mineral with descriptions of properties and methods used].—U. S. G. S. Bull. 641-A; pp 16*.

—*Great Britain, Special Reports on the Mineral Resources of*.—Geol. Surv. of England. Vols. III, IV, V; \$1.

III. TECHNOLOGY

MINES AND MINING

Prospecting

Probert, Frank H.—*Surficial Indications of Copper*. [On the geological and mineralogical peculiarities of ore outcrops].—M. & S. P. Aug. 19 1916; p 267; pp 9*; 20c.

Shaw, Eugene W.; Matson, George C.; Wegemann, Carrol H.—*Natural Gas Resources of Parts of North Texas*. [Describes the geology and the various operating fields, with some of the various methods they employ].—U. S. G. S. Bull. 629; pp 129*.

Supports: Timbers, Props, Stowing

Crankshaw, H. M.—*Mining and Ventilation Methods in Thick Pitching Beds*. [A paper to be read at the A. I. M. E. Arizona meeting].—Coal Tr. Bull. Aug. 15 1916; p 23; pp 5*; 25c.

Watts, A. C.—*Coal-Mining Methods in Utah—II*. [Various methods for working superimposed beds simultaneously].—Coal Age Aug. 12 1916; p 258; pp 5*; 20c.

Telephones and Signaling

—*Electric Signaling in Mines*.—Coll'y Guard. July 28 1916; p 157; pp 3*; 35c.

Production

Brooks, Alfred H.—*The Alaskan Mining Industry in 1915*. [Reviews the production and conditions in different districts, with information on coal and metal mining law].—U. S. G. S. Bull. 642-A; pp 71*.

Burchard, Ernest F.—*Cement in 1915*. [Takes up different phases of the market separately and gives curves in some instances, with the production in each case].—Min. Res. of U. S. II:16; pp 24.

Hill, James M.—*Platinum and Allied Metals in 1915*. [Reviews production in general, by states and foreign countries.

Methods of refining and extracting from other metals is spoken of briefly].—Min. Res. of U. S. 1:6; pp 19.

Hubbard, J. D.—*The Quartz Veins of Butte County, California*.—E. & M. J. Aug. 19 1916; p 352; pp 2*; 25c.

Spencer, Arthur C.—*The Atlantic Gold District and North Laramie Mountains, Fremont, Converse and Albany Counties, Wyoming*.—U. S. G. S. Bull. 626; pp 85*.

Wagner, William.—*Coeur d'Alene Mining Information*. [Financial statements of the larger companies are given and production and value thereof for the smaller ones. Brief separate accounts of each company in the district are also given].—Wagner, Wallace, Ida.; book; pp 174; \$4.

Mining Costs

Wagner, William.—*Coeur d'Alene Mining Information*. [Financial statements of the larger companies are given and production and value thereof for the smaller ones. Brief separate accounts of each company in the district are also given].—Wagner, Wallace, Ida.; book; pp 174; \$4.

Canadian Mining Corporation. [Cost and other details of operation].—E. & M. J. Aug. 19 1916; p 348; pp 1¼; 25c.

MILL AND MILLING

Crushing, Grinding, Etc.

Gudgeon, C. W.—*Milling Scheelite-Gold Ores*. [Abst. from a paper read before the Aust. Inst. of M. E. Flow sheets and costs are given, with description].—E. & M. J. Aug. 19 1916; p 346; pp 2*; 25c.

Scott, W. A.—*Operations at Battle Mountain, Nevada*.—Mg. World Aug. 19 1916; p 327; pp 2*; 10c.

Flotation

Scott, W. A.—*Operations at Battle Mountain, Nevada*.—Mg. World Aug. 19 1916; p 237; pp 2*; 10c.

Stander, H. J.—*The Function of Oil and Acid in Flotation*. [Describes tests and theory, bringing out the principles underlying flotation].—Mg. World Aug. 19 1916; p 317; pp 3¼*; 10c.

Concentration: Sorting, Sizing, Washing

Gudgeon, C. W.—*Milling Scheelite-Gold Ores*. [Abst. from a paper read before the Aust. Inst. of M. E. Flow sheets and costs are given, with description].—E. & M. J. Aug. 19 1916; p 346; pp 2*; 25c.

Scott, W. A.—*Operations at Battle Mountain, Nevada*.—Mg. World Aug. 19 1916; p 327; pp 2*; 10c.

Cyaniding

Rose, Hugh.—*Mining and Milling Practice at Santa Gertrudis, Pachuca, Mexico*. [A complete detailed description with drawings].—Bull. A. I. M. E. Aug. 1916; p 1295; pp 38*; 35c.

Amalgamation

Smith, Howard D.—*Gold Saving on Dredges*. [Results are tabulated and drawings of jigs, etc., used in saving the gold from the dredged gravel are shown].—M. & S. P. Aug. 5 1916; p 202; pp 2¼*; 20c.

Mill and Smelter Costs

Gudgeon, C. W.—*Milling Scheelite-Gold Ores*. [Abst. from a paper read before the Aust. Inst. of M. E. Flow sheets and costs are given with description].—E. & M. J. Aug. 19 1916; p 346; pp 2*; 25c.

Canadian Mining Corporation. [Cost and other details of operation].—E. & M. J. Aug. 19 1916; p 348; pp 1¼; 25c.

CHEMISTRY AND ASSAYING

Chemistry

Clennell, J. E.—*Estimating Metallic Aluminum in Aluminum Dust*. [Deals mostly with gasometric methods].—E. & M. J. Aug. 12 1916; p 309; pp 1½; 25c.

Difference in domestic and foreign prices explained by the fact that the New York quotations are per fine ounce; the London per standard ounce 8.925 fine.

Copper.—Business in copper continues to improve. Demand is constantly increasing. Consumers are showing more attention to 1917 requirements. Prices are advancing gradually. The market is being firmly established at each advance. The copper situation, although closely controlled by the large producers, is being conservatively controlled. Price advances are moderate. The hue and cry of manipulation is not heard. The market has already experienced four weeks of activity and is now shaping for some tremendous buying. The outlook is that before the end of September the producers will be almost fully sold over the first half of next year and have large orders for the last half. Solidarity characterizes the copper market. There appears to be no desire to hasten things along. Whatever impetus the market has had arose from consuming demand and not from forcing of the market. The above tells the copper situation in concrete form.

In the past week copper demand showed constant expansion. Each day brought larger inquiries and the price advances were easily sustained. In fact, the higher prices served to stimulate demand from users who were reticent to cover. Electrolytic went up to 28 cts. for November delivery and to 27 $\frac{3}{4}$ cts. for December. Absorption of copper last week is estimated at 40,000,000 lbs., of which domestic users took 30,000,000 lbs. There was some foreign demand for spot and September copper, but the large producers could not supply the metal. Spot metal is held at 28 $\frac{3}{4}$ cts., while for September delivery some holders asked 28 $\frac{1}{2}$ cts. Increased buying of copper for delivery next year furnished the most interesting feature of the market since our last report. Sales for the first quarter were made at 26 $\frac{1}{2}$ cts. and for the first half at 26 $\frac{1}{4}$ cts., but later sellers reported doing business at 27 cts. for the first quarter and 26 $\frac{3}{4}$ cts. for the first half of 1917. The forward buying of copper by brass makers and wire drawers serves to draw attention to the growing belief that the red metal will enjoy continued prosperity over next year. Consumers are not hesitant in placing their orders. The situation has finally developed so that the era of high prices will continue irrespective of the termination of hostilities. Copper will be just as urgently needed for reconstruction after the war as it is now required for actual warfare. This viewpoint is responsible for the diminishing view that inflation would bring its reflex.

Based on the law of supply and demand, the prevailing

values in copper are not inflated. Some authorities who formerly held the other view now concede the inherent strength of the market. They agree that production cannot be increased much more while demand is in a constant state of augmentation. While efforts to increase refining capacity are noted, lack of labor, difficulty in obtaining facilities and other kindred affairs tend to prevent further expansion. The additional refining capacity that some of the large companies hoped to have in operation now has been delayed from these causes.

The closing of the big allied order for 125,000 tons is in sight. An important banking official has declared that the matter will soon be settled. It is learned that the price will be around 25@26 cts. When this business is booked producers expect that general demand will take another leap forward. In connection with the order, it is understood that a non-cancellation clause is to be attached. Some fair foreign buying for the first quarter has just been done, while cable inquiries for the fourth quarter of this year are frequent.

At London the situation in standard copper has changed. Advances have replaced declines and the market is gradually regaining its recent losses. Electrolytic copper advanced £3 to £129 last week, while standard at the close held at £110 for spot and £108 for futures.

Exports of copper reported since the first of August total 25,314 tons. As this aggregate only includes shipments from New York, Philadelphia and Baltimore it is apparent that the entire United States exports in August will run above 35,000 tons. These large exports are confirmatory of the heavy buying reported to have been done by the allies last spring.

Quotations for copper per pound at New York for the week ended Aug. 30 were as follows:

Tin.—After a very dull week the tin market is again showing signs of strength, with some fair buying of futures, while spot is inclined to be quiet. To a certain extent it is noted that futures are slowly moving higher than spot and may command a premium before very long. Users last week were out of the market and efforts to stimulate demand by bullish reports failed of success. Spot Straits declined to 38½ cts., but later advanced to 39¼ cts. It is noteworthy that sellers are asking 39@39¼ cts. for September to December arrivals. A few sales of November and December shipments from the Straits were made at 38¾ cts. and on this basis it is figured that nearby arrivals should be worth nearer 40 cts. Less offerings of Banka and Chinese tin were noted. The Dutch government is again conserving supplies of Banka. Foreign markets were easy last week, but closed somewhat firmer. At the opening of the current week London and Singapore came with a fairly sharp advance and the limits indicated that sellers abroad were confident of higher prices. Arrivals of tin since the first of the month total 3557 tons and the stock afloat to this country totals 2735 tons. The August statistics are expected to be bullish, although not extremely so, in view of the large spot stock on July 31.

Quotations for tin per pound at New York and per ton at London and Singapore for the week ended Aug. 30 were as follows:

Aug.	New York		London	Singapore
	Spot.	Sept.	Straits, spot.	shipments.

Lead.—Excitement in the lead market has subsided. Very heavy buying by consumers in this country and in Canada resulted in prices advancing to 6¾ cts. New York and 6.65 cts. St. Louis for spot metal. With the quieting down of demand the market has retained its strength. The American Smelting & Refining Co. declined to follow independents when they went beyond 6.50 cts., this action being attributed to a lack of metal controlled by the principal producer available for sale. Independents are now booked full over September and are not disposed to sell beyond. Consumers, on the other hand, are sounding the market for October, November and December. The spot market is very strong, with little metal to be had. Producers are bare of

spot and what inquiries are coming into the market are being filled by dealers who are securing fancy prices.

The heavy Canadian purchases amounting to over 4000 tons indicate the placing of some small arm ammunition contracts in the Dominion. Cartridge makers in this country have also been buyers of lead. It is reported that the leading interest has taken some very large orders for the fourth quarter on open price contracts, which leads to the belief that an advance will be announced early in September.

Recounting the advance in lead one independent declares that the price would have gone much higher if there were fewer producers who conducted their own selling agencies. He pointed out that some lead sellers were comparatively new in the business and were inclined to be timid, whereas if the business were more centralized, as in the case of copper, the market could have gone up to 10 cts. without trouble. The fact that independents were sold out for all of September before Aug. 22 is taken to prove this point. Although London has not been buying lead in this market, prices abroad have advanced steadily. Last week spot lead at London advanced 12s 6d, while futures went up £1.

Quotations for lead per pound at New York and per ton at London for the week ended Aug. 30 were as follows:

Aug.	New York		London	
	Indpts.	A. S. & R. Co.	Spot.	Futures.

Lead Ore.—The Missouri-Kansas-Oklahoma market for ores remained unchanged during the week ended Aug. 26 and ores were sold at \$65, though some went as low as \$63. Production is still low and during the week there were produced 1,219,380 lbs. of concentrates, which brought the total for the year to date to 68,481,492 lbs. The week's production was valued at \$39,585 and the year's at \$2,925,484.

Zinc Ore.—Little change was noted, though an easing off of the spelter market in no way encouraged strength. In all but the Oklahoma fields the drouth hindered milling operations some. The production for the week was given out at 9,161,870 lbs. and the total for the year to date at 30,301,224 lbs., which amounts were valued at \$288,766 and \$19,576,633. The prices obtained were from \$70 to \$50, as during the previous week.

Calamine.—The market still remains fast at \$35 to \$45, and the production of 225,700 lbs. was less than 50% of the production of the previous week. The total for the year to date was given at 20,210,310 lbs., and valued at \$728,882, while the week's production was valued at \$1602.

Spelter.—Business has again fallen back into a rut. Buyers who were active a few weeks ago are now displaying no interest in the market. Prices have receded slightly and the market is now easy, with sellers willing to take concessions. Some large sellers have been offering futures very freely in an effort to stimulate sales, but users are chary about taking metal in view of the statistical position and the changing situation in world demand. On this basis it is thought that prices will recede still further.

Advices from abroad indicate that England will not be a buyer for 1917 requirements, having by the end of the year increased home output sufficiently to take care of its needs. Added to this the production in Australia, which will come forward in the early part of 1917, creates a surplus output. Thus spelter is suffering from over-expansion, nurtured by high prices. Spot prime western held at 9½ cts. New York and 9¼ cts. St. Louis at the opening of the current week, with some sellers quietly shading a quarter of a cent. For September delivery sellers asked 8½ cts. St. Louis, with October held at 8¼ cts., November at 8½ cts. and December at 8½ cts. These prices are wholly nominal in view of the absence of business and judging from the willingness to sell it would not be difficult to shade them down a quarter of a cent. At London last week spot spelter advanced £4 to £58, while futures receded £4 to £45 on reported larger offerings from this side.

Quotations for spelter per pound at New York and per ton at London for the week ended Aug. 29 were as follows:

	New York.		London.

MISCELLANEOUS METALS.

Quicksilver.—The recent weakness in the metal was designed to force the liquidation of holdings by small sellers, it is now learned. That this aim succeeded is shown by advances in prices. Sellers are now asking \$77 a flask for spot virgin, with an improved demand from regular users. A fair export demand is reported. Some sales to England have been made, while Norway has been in the market.

Antimony.—The recent buying movement was only a flash in the pan. This is proven by the dullness that now prevails and the efforts of some sellers to secure business by shading prices. Spot is now held at 13 cts., while for future

arrivals 11 cts. duty paid has been quoted. The needs of war consumers covering the market has again settled back waiting for inquiries from regular users.

Aluminum.—There has been a fair amount of business transacted recently, with prices higher. Sellers have taken orders for No. 1 virgin ingots at 60@62 cts. a pound in ton lots. Domestic users have taken some metal for the last quarter. It is stated that the leading interest has done a very extensive business for the first half of next year, but has stopped quoting the low prices at which orders were taken.

Bleaching Powder —			
Drums, 100 lbs.	4.50	to	5.00
Borax —100 lbs., car lots	7.75	to	8.00
Coke —Connellsville furnace	2.75	to	2.80
Foundry	3.00	to	3.50
Copperas —Spot, lb.	1.50	to	2.00
Ferromanganese —Spot	175.00	to
Last half	175.00	to
Ferrosilicon, 50%			85.00
Ferrotitanium, per lb.	.08	to	.12½
Fuller's Earth, 100 lbs.	.80	to	1.05
Glaucous Salts, bags.	.50	to	.75
Calcined			2.50
Iron Ore —			
Bessemer, old range, ton			4.45
Bessemer, Mesabi			4.20
Non-Bessemer, old range			3.70
Non-Bessemer, Mesabi			3.55
White crystals	.15%	to	.15%
Broken, cakes	.14%	to	.15
Powdered	.17	to	.17½
Lead —Granulated, lb.	.17	to	.17½
Brown sugar	.14%	to	.15%
Litharge, American, lb.	.09	to	.09½
Mineral Lubricants —			
Black summer	.13½	to	.14
29 gr., 15 c. t.	.14	to	.15
Cylinder, light, filtered, gal.	.21	to	.26
Neutral, filtered, lemon, 29 gr.	.37½	to	.38
Wool grade, 30 gr.	.19½	to	.20
Paraffin —High viscosity	2.9½	to	3.0
Naptha (New York) —			
Gasoline, auto	.23	to	.25
Benzine, 59 to 62°, gal.	.28	to	.28½
Nickel Salt, double.	.07½	to	.08½
Single	1.0%	to	.11
Petroleum —			
Crude (jobbing), gal.	.15	to	.18
Refined, bbl.			.12
Platinum —Oz. ref.	50.00	to	55.00
Potash Fertilizer Salts —			
Kainit, mln. 15% actual potash			32.00
Muriate, 80 to 85%, basis 80%, ton	450.00	to	475.00
High grade sulphate, 90 to 95% basis of 90%	400.00	to	450.00
Hard salt, man., 12.4% actual potash	Nominal		32.00
Potassium —			
Bichromate	.39	to	.40
Carbonate, cal. 96 to 98%	1.30	to	1.35
Cyanide, bulk, per 100%	.75	to	1.00
Chlorate	.45	to	.50
Prussiate, yellow	.70	to	.75
Prussiate, red	1.85	to	2.00
Saltpeter —Crude, lb.	.12	to	.14
Refined	.25½	to	.26
Soda —Ash, 48% (43% basis), bbl.	2.75	to	3.00
Strontia Nitrate, casks, lb.	.30	to	.31
Sulphur —			
Crude, ton	28.00	to	29.00
Crude, ton	28.50	to	29.00
Roll, 100 lbs.	1.95	to	2.25
Tin —Bichloride, 50°, 100 lbs.	.13½	to	.14
Crystals, bbls., lb.	.29½	to	.30
Oxide, lb.	.43	to	.45
Zinc Chloride	.10½	to	.11½

SILVER KING COALITION MINES CO., PARK CITY, UTAH. UPPER TERMINAL OF TRAMWAY IN FOREGROUND.

Operations of Silver King Coalition Mines Co., Park City, Utah

W. A. SCOTT.

The Silver Hill underground hoisting and compressor station, of the Silver King Coalition Mines Co., Park City, Utah, was completed a year ago, and installations have since been made. This station, situated at the interior terminus of the 9400-ft. Alliance tunnel, is 1650 ft. vertically below the surface, and is central to a large territory of the company's undeveloped ground. The main working shaft of the property, near the collar of which the shops, mill and offices are situated, opens the mine to a depth of 1300 ft. It is connected to the Alliance tunnel by a 2200-ft. crosscut, driven from the shaft's 500-ft. level. In all operations at the Silver Hill station, the waste is hauled out through the Alliance tunnel, and all the ore is taken to the main working shaft and hoisted to the surface, where the mill and upper terminal of the tramway are accessible. The space cut out for the Silver Hill station was divided into two arch-roofed chambers. One of these, 50x35 ft., contains the hoist and steel headframe; the latter, set upon concrete piers, 8 ft. high, reaches a height of 46.5 ft. to the center of the 6-ft. sheaves. The other chamber, 44x25 ft., is the compressor room. These chambers are protected by concrete walls, and supported in their centers by 18-in. I-beams.

The larger chamber contains a Wellman-Seaver-Morgan double-reel, first-motion, electric hoist, oper-

ated by a 400-hp. motor. The hoist cables are the flat-rope type, 1½x4½ ins., having a length of 1600 ft. Each cable is attached to a skip of 52-cu. ft. capacity, operating in the Silver Hill interior shaft. This type of skip was designed by James Humes, manager of the property, and they were made in the Silver King shops.

The other chamber contains two Sullivan air compressors, 2-stage, angle type. One of them is rated at 147 hp., having a capacity of 704 cu. ft. per minute, and is belt-driven by a synchronous motor-generator set; the other machine has a capacity of 873 cu. ft. per minute, and is direct-connected to a synchronous motor. These compressors supply air for operating the shaft pumps and drills used in shaft sinking, which has been in progress several months.

Included in the electrical equipment at this station is one direct-current generator driven by a synchronous motor; one direct-current motor, direct-connected to hoist shaft; and other accessory equipment. In the main hoist room is a 10x12 double-cylinder, single-drum hoist for handling shaft pumps.

Pumping Equipment.

Sinking pumps are used, as sinking progresses, to raise water from the bottom of the shaft to cement tanks at each 200-ft. station. A Jeanesville pump, of

SILVER HILL STATION, SHOWING ELECTRIC HOIST AND HEADFRAME.

600 gals. capacity, is stationed at each of the station tanks. At the 600-ft. level is stationed a 750-gal., 4-stage Worthington pump, operating against a head of 600 ft., delivering water at the tunnel level.

In sinking this shaft, the skips are too large to load quickly in the bottom of the shaft, so provision is made to hang a large mine bucket under the skip, as shown in one of the accompanying illustrations. The bucket, hung below each skip, is loaded, raised, and dumped into pocket chutes at the several levels. This material is afterward hoisted in the skips and dumped into pockets at the collar of the shaft. These skips have valves in the bottom, so they may be used as bailers of water when occasion requires it.

In the old workings, tributary to the main shaft, there are as strong ore bodies and as high-grade ore on the 1300-ft. level as was formerly mined in the

higher levels; and development and production proceeds on levels above the 1300 in a direction toward the Silver Hill station.

The mine is producing 100 tons per day of smelting ore, averaging a value of \$60 per ton. The mill is handling about 200 tons per day, the sulphides and carbonates coming to the mill in about equal amounts. The mill treatment of the two classes of ore are the same down to the place of handling slimes. Double-deck Deister tables, made by Deister Concentrator Co., have been installed to handle slimes from the carbonate ores, about 85% of the metals being saved. The first product is made on Hartz jigs, the reject all being reground in a Marcy mill, the pulp from which is concentrated on Wilfley coarse tables. The sulphide slimes are treated in Callow flotation cells. The carbonates, from the old workings, run 7.2 ozs. silver,

AIR COMPRESSOR AT SILVER HILL STATION.

MOTOR GENERATOR SET AT SILVER HILL STATION.

SHAFT, SILVER HILL STATION.

BACK VIEW OF SKIP CHUTES.

5.5% lead; the sulphides, from the 1300-ft. level, average 10 ozs. silver, 7% lead; the Alliance tunnel sulphides average 5 ozs. silver, and 6.9% lead. In milling the carbonates, a recovery of 85% is made, and about a 90% recovery is made on the sulphides. The concentrate products are worth about \$50 per ton. W. F. Devlin is mill superintendent. Information furnished and courtesies extended by James Humes, general manager, are hereby acknowledged.

Carnotite is a mineral containing vanadium and uranium in varying proportions. Commercial grades run about 4% vanadium oxide and 2% uranium oxide.

Foreign Copper Visible Supply.

The copper visible supply in England, France and afloat thereto increased 492 tons from Aug. 15 to Sept. 1, being 13,062 tons on latter date. Recent figures of visible supply compare:

Explosives and caps or detonators should not be left in the mine or anywhere else where they cannot be protected from shock or accidental ignition.

TWO ELECTRIC 3-TON MOTORS IN FOREGROUND, SILVER HILL STATION.

FRONT VIEW OF SKIP CHUTES.

The French Electrolytic Process.

The French process consists in the use of a solution of bisulphide of soda, and a small quantity of manganese. Bisulphide of soda rapidly dissolves the zinc from the roasted ore. Along with the manganese in solution, it completely prevents the anodes from being affected. This solution has little resistance to the passage of the electric current in the electrolytic vats, and the consumption of current is thus lowered. It has also the peculiarity of throwing out of solution practically all the impurities which usually contaminate the zinc. A demonstrating plant erected at Silverton, on Slocan Lake, by the Standard Silver-Lead Mining Co. proved that the process would work on a large scale. It comprised two completely equipped dissolving vats, each capable of dealing with 2500 lbs. of liquor at a time and about 1000 lbs. of ore. The zinc-depleted liquor containing bisulphate of soda from the electrolytic vat is pumped into the upper of these two vats. There is then added 700 to 1000 lbs. of roasted ore from which the zinc had been partly extracted in a previous operation. In about an hour, solution of the zinc is finished, and when the liquor has settled for a short time it is allowed to run down into the second dissolver, placed at a lower level. The sludge remaining in the bottom of the dissolver is then pumped through a filter press to remove the water and the residue contains all the silver and lead. As the sulphur to the extent of more than 20% has been driven off in the roasting operation and zinc to the amount of about 40% has been extracted, the residue of the ore only weighed about 45% of the original ore used. As it contained all the silver and lead originally in the roasted ore, the percentage of these metals was more than doubled. For instance, the ore treated assayed 31% zinc, 3.5% lead, and 32 ozs. silver. The zinc-depleted residue contained 76 ozs. silver and 8.7% lead, and 92% of the zinc had been taken out, that is, 2.7% of the zinc counted on the original ore used was left in the residue. This residue is now ready for smelting or other treatment for the recovery of its lead and silver in the usual way. To the liquor which has been run down into the second dissolver, a quantity of roasted ore is again added to neutralize the bisulphate of soda. As soon as this has taken place, the liquid settles rapidly to a clear solution, which is pumped through a clarifying filter press, and is then ready to have its zinc deposited in the electrolytic vats. At the plant only one electrolytic vat was used, as the dynamo power at disposal was limited. Nine anodes were used and eight cathodes of the largest size, each with an area of 8 sq. ft. Although 4000 kilowatt-hours were allowed for the deposition of one ton of zinc, only 3000 kilowatt-hours were actually required, the lowest reading over a period of 48 hours having been 2680 kilowatt-hours. As the zinc is deposited from solution in the electrolytic vat, the bisulphate of soda with which it was combined is regenerated and is used

again in the next dissolving. The working costs vary with the ore, but they are now well defined. The plant is expensive, but much less than that required for a zinc smelter of similar capacity. Ores of almost any grade above 10% can be treated equally well, but naturally the cost of treatment for an ore with a larger zinc content is less.

Bonds for building a new plant have been guaranteed by the Canadian government and work is rapidly going ahead.

International's Canadian Nickel Smelter.

The proposed new refinery to be erected in Canada for the refining of Canadian nickel to supply the needs of Great Britain and her foreign possessions will call for an expenditure of \$8,500,000.

A subsidiary concern has been formed in Canada to own and operate the new plant and its \$5,000,000 capital stock will be owned by the International Nickel Co.

Nickel prices have shown comparatively little advance beyond the normal level except where desired in the fine arts. On nickel sold for such requirements a premium has been demanded. At the present time the company's quotation ranges from 24 to 42 cts. a pound according to specifications; where higher than normal prices, they do not exceed 5%.

It is the general belief that there will develop after the war a greater demand than now exists for the products of the International Co. Shipyards all over the world have been straining every effort to get out new vessels. The construction of marine equipment promises to continue at a record breaking pace after peace has been established and this alone augurs well for the world's largest producer of nickel.

At the Copper Cliff mines there has been installed hoisting equipment capable of raising 4000 tons of ore in 8 hours. This, operated one shift a day, will more than care for the present milling and smelting requirements of about 3500 tons daily and enable the company to build up a reserve in bins against the day when a greater tonnage will be needed.

The company's operations now result in an output of approximately 5,000,000 lbs. of nickel and 3,000,000 lbs. of copper monthly or a total of 60,000,000 lbs. and 36,000,000 lbs. respectively per annum.

Krupps Buy Copper Mine.—A recent dispatch from The Hague stated that the Arthur Krupp Metal Co. had purchased the Mitterberger Copper Mine Co., thus placing the Krupps of Essen "independent of the copper market." The Mitterberger is an old property opened in 1827. It is located in the Austrian Tyrol, and for years the output averaged something over 1,000,000 lbs. of copper a year. It was 1,254,000 lbs. in 1905, 1,059,000 in 1906, and 1,730,000 in 1910. The 1911 output was estimated at 3,300,000 lbs. The mine employs about 200 men.

Notes on the Chemical Assay of Tin Ores

A. M. MATHESON.*

The object of the following notes is to show the difference between fire and chemical assays carried out on a highly pyritic tin ore, and to show the impossibility of estimating mill losses by the vanning and fire method.

The tin occurs in the ore under consideration as cassiterite (SnO_2), the sulphur being mostly combined with Fe, As, Sb, Cu, Pb, etc.

Stannite may occur very sparingly, but, being soluble in the preliminary acid treatment, it would not play a part in either the fire or chemical assay. The preliminary treatment this ore receives is the usual crushing and concentration with jigs, Wilfley tables, and vanners. The whole of the pyritic concentrate is calcined, and a secondary treatment of the same kind follows. The resulting concentrate for sale averages about—Sn, 71.00% ; Pb, 0.29% ; S, 0.31% ; and As, 0.10%.

The writer carried out numerous experiments to determine the mill losses, both by fire and by chemical assays, and a few are here quoted. The fire assay used is that of vanning after digestion, and fusion with cyanide method. The chemical assay is the Pearce-Low method, as follows: 0.5 gm. finely-ground ore is digested with aqua-regia and filtered, the filter paper and contents ignited, and fused in a nickel crucible with NaOH.

The cake is dissolved with water and about 30 cc. HCl, transferred to a conical flask, and 50 cc. excess HCl added. A strip of nickel is inserted, and the solution boiled for 1½ hours; the stannic chloride is then reduced to stannous chloride. The nickel is then removed, and a piece of carbonate added to prevent oxidation, the assay cooled and titrated with standard iodine solution with starch indicator.

The three products under consideration in the following assays are: (1) battery pulp, (2) tails from primary treatment, (3) tails from secondary treatment.

(1) Battery Pulp— Fire assay. Per cent.	Chemical assay. Per cent.	Ratio of chemical to fire.
1.29	2.48	1.92
1.20	2.10	1.75
1.70	3.14	1.84

The above assays are taken from a number done on the same product, but from different samples, and it will be seen that the fire-assay result is a little over 50% of the chemical-assay value. In the fire assay 100 grm. ore were taken.

(2) Primary Tails— Fire assay. Per cent.	Chemical assay. Per cent.	Ratio of chemical to fire.
.10	.84	8.40
.19	1.03	5.42
.12	.96	8.00

The above assays are taken from a number done on the same product, but from different samples, and it will be seen that the recovery by fire assay (about 14.5%) is very much lower than would be expected. However, in making a comparison between this recovery and the recovery of 50% in the pulp product, it must be remembered that all the easily recoverable oxide has already been taken out by the plant, and only the very fine slime concentrate left for vanning. In the fire assay 100 grm. ore were taken for vanning. Although quite an appreciable amount of oxide was obtained, the resulting tin button was very small indeed (in some cases only about 20% of the oxide obtained), showing that a further loss took place in the fusion, the tin oxide probably going into the slag in combination with the silica as stannous silicate.

In vanning this tail product it is not possible to get rid of all the silica without making a very great loss of oxide. It becomes questionable, however, whether the loss made in thoroughly cleaning the oxide would be greater than the loss in the fire when smelting in the presence of silica. The writer came to the conclusion, after numerous experiments, that a 100 grm. charge of this product was much too large to handle without a great loss, so a 10 grm. charge was tried, with the following results:

	Per cent.
Chemical assay	0.84 Sn.
Oxide obtained	0.60 Sn.
Metal estimated at 70%	0.42

This shows a recovery of 50% of the chemical value by vanning. The oxide obtained in this case was considered too small a quantity to smelt, and was estimated at 70% metal.

Considering the loss that must have taken place in vanning this oxide clean, and the subsequent loss that would have taken place in the fire if smelted, it seems reasonable to suppose that the oxide actually weighed should equal 70% metal or more. It seemed almost impossible to reach anything like finality in vanning this tail product, a fair proportion of the tin oxide always remaining in suspension even after long settlement. A grading analysis carried out on this product resulted as follows:

Sieve.	Bulk Grade.	Chemical Assay, 1.24%.	Product.	Tin.	Percentage.
+20
+40
+40	29.8	1.00	29.8	29.0
+80	22.5	.50	18.00	17.60
+100	7.0	.60	4.20	4.10
+120	17.30	.60	10.40	10.20
-120	23.40	1.72	40.30	39.10
Total	100.00	1.24	102.70	100.00	1.03

The result of this grading analysis does not check with the bulk assay as well as might be expected, but the low result is most probably due to the mechanical

*Proceedings of the Australasian Institute of Mining Engineers.

(filtration) loss that takes place, more especially in the finer grades.

(3) Secondary Tails—		
Fire assay. Per cent.	Chemical assay. Per cent.	Ratio of chemical to fire.
.21	.68	2.81
.15	.48	3.20
.18	.52	2.90

The above assays were taken from a number done on the same product but from different samples, and also show a very low recovery by fire assay (about 33% of the value as shown by the chemical assay). A 100 gm. charge was used in vanning for the fire assay. This was also a very difficult sample to van, and the same remarks apply as to vanning and fusion losses as in the case of the primary tail sample. When a 10 gm. charge was used in vanning the results were as follows:

Fire assay. Per cent.	Chemical assay. Per cent.	Ratio of chemical to fire.
0.40	0.80	2.00
0.36	0.69	1.66
0.30	0.56	1.87

These assays show a much better recovery by fire, but the vanning and fusion losses are still considerable.

In order to find out what extraction might reasonably be expected from a slime table operating on these two tail products, the following vanning experiments were carried out, the conditions being as near as possible to those obtaining in actual work:

(1) Vanning primary tail for 15 minutes without acid treatment, and in dirty water.

(Chemical assay value, 1.24% Sn.) The pyritic concentrate obtained was acid treated, resulting in oxide equal to 0.70%, estimated metal 0.49%, showing that the table might be expected to save about 40% of the tin contents.

(2) Vanning secondary tail for 15 minutes without acid treatment, and in dirty water.

(Chemical assay value, 0.88%.) Oxide obtained 0.60%, estimated metal 0.42%, showing that the table might be expected to save about 48% of the tin contents. It might be mentioned here that a Cornish round table is now operating on this tail product, and has made an average saving of 50%. In these products under consideration it will be noticed that the tin values vary very much indeed; but such is the case, and this condition seems to be consequent on physical changes being encountered in the ore in the mine. The more pyritic the ore becomes the greater are the losses in the tails from primary treatment. The chemical assay records these physical changes very faithfully, while the vanning and fire assay—even if carried out very carefully—fails almost completely to show these changes. Before the introduction of the chemical assay by the writer, these mill losses were estimated by fire assays, and it would appear that they were carried out with more regard to speed than to accuracy. Records taken over some years show little or no variation. The extraction by the plant estimated by these fire assays would be anything from 90 to 97%, which is altogether too high to expect from even the most up-to-date plant on this class of ore. The extraction estimated by the

chemical assays is very much lower, and certainly much nearer the truth, but does not necessarily show that the plant is not doing good work.

When nickel became unprocurable owing to the war iron in the form of horseshoe nails had to be used as a reducer in the chemical assay. The results occasionally were low and unreliable probably due to oxidation taking place. HCl acts much more readily on iron than on nickel, consequently less iron had to be used. Apparently all the acid of the assay was used up in the formation of ferrous chloride none being left to form CO₂ with the carbonate and oxidation appears to have taken place.

The following assays were carried out, varying the number of nails used to test this suspected oxidation. These assays were carried out on a pulp sample, the correct assay of which was 3.08% Sn:

1.—4 nails.....	1.48% Sn.
2.—4 nails.....	2.52% Sn.
3.—2 nails.....	3.08% Sn.
4.—2 nails.....	3.08% Sn.

Oxidation did not always take place with four nails, but the results were low and unreliable. A considerable number of tests were carried out on different samples of a similar product, and a few are here quoted: Nos. 1, 2, 3 and 4, 3.28%, 3.24%, 3.00%, using two nails each.

Using two nails only the results became constant and reliable, there being sufficient free acid left in the assay to form CO₂ with the carbonate and prevent oxidation. A further test was made on sale concentrates assaying 70.00 Sn by the fire assay; (1) one nail gave 63.07% and (2) two nails gave 69.74%.

The following assays on the pulp and tailings show the results of using too much iron:

- 1.—Mill pulp—4 nails, 0.74%; 2 nails, 1.26%.
- 2.—Primary tails—4 nails, 0.52%; 2 nails, 0.70%.
- 3.—Secondary tails—4 nails, 0.36%; 2 nails, 0.78%.

According to some authorities, the chemical assay gives high results, and certain impurities tend to make results high; however, that has not been the experience of the writer. Sale concentrates, which must necessarily contain all the heavy impurities of the original ore, concentrated, invariably give slightly low results as compared with the fire assay. These impurities must have, therefore, little effect on the assay of the pulp and tail products.

The Effect of Wolfram.—In particular it has been stated that wolfram interferes with the chemical assay and gives high results. The following test was made on an ore assaying 30% Wo₃ and 4% Sn. This was treated as an ordinary tin-ore assay, using iron as a reducer, with the result that the assay assumed a deep blue color shortly after reduction commenced, owing to the formation of a tungsten tungstate. Titration with iodine was impossible. However, the obvious thing to do with an ore carrying any

tungsten would be to extract the H_2WO_4 with ammonia, evaporate the ammonium-tungstate, and estimate as WO_3 , then proceed with the residue on the filter as a tin assay.

The writer does not contend that the chemical assay should take the place of the vanning assay in estimating mine samples. The latter is shorter, and certainly serves as a guide as to what should reasonably be expected from the mill; however, the estimation of the oxide obtained after acid treatment and careful vanning should be near enough, taken at 70% metal, without going to the extra trouble and expense of smelting, knowing that a further loss in the fire is almost sure to take place. For instance, in the case of the Cornish table previously referred to, where vanning assays gave an expected extraction of 48%, the table, when installed, actually saved 50%. It is evident, therefore, that as a guide to mill work the vanning assay has its uses.

Tin Mining in the Federated Malay States.

Details regarding the tin mining position in the Federated Malay States are given in the 1915 report of the Senior Warden of Mines just issued which states that the most serious effect of the war upon the industry was the rise in freights and insurance, and the consequent increase of cost of placing the output on the London market. In the beginning of 1915 freight from Singapore to London was £1 10s per ton; by the end of the year it had risen to £4. The following comparative table is given of the output and value of tin from the four States composing the Federation:

	1915. Tons.	1915. £	1914. Tons.	1914. £
Perak	27,776	4,255,603	28,557	4,110,530
Selangor	13,938	2,135,236	15,103	2,173,999
Negri Sembilan	1,244	189,699	1,697	244,292
Pahang	3,808	581,430	3,685	530,433
	46,766	7,164,968	49,042	7,059,254

It is estimated that mines under Chinese management produced about 72% of the total output, against 76% in 1914.

When the Mines Department census was taken at the end of the year the total labor force was 164,457 (all of whom, with the exception of 1228 men, were employed on tin mining), as against 171,689 in 1914 and 225,405 in 1913. Chinese are chiefly employed in the mines, the total of this nationality being 156,514 as compared with 5313 Indians and 2372 Malays, while the number of Europeans has increased from 184 to 205, probably on account of the steady increase in the use of machinery for mining purposes. A notable

change during 1915 was the alteration in the proportions of laborers on tribute, contract, or wages, the comparison for two years being as follows:

	1915.	1914.
Tribute	85,589	101,909
Contract	45,070	40,110
Wages	32,131	27,309
Individual licenses	1,667	2,361

In spite of war conditions, the expansion in the use of machinery has continued, though the increase is mostly due to existing plants being again brought into use and to the completion of installations that have been in progress for some time. In Perak a large steam electric plant that has been closed down in 1914 was again brought into operation, and the Gopeng Consolidated hydraulic plant came into use. Taking the local average of eight laborers per horse power, the aggregate is equal to a labor figure of 449,576 in 1915 against 332,984 in 1914 and 206,048 in 1913, a point to be borne in mind when considering the drop in the manual labor supply. At the beginning of the year three bucket dredges were at work; at the close the number had increased to 10 (all in Perak), capable of handling about 30,000 cu. yds. per diem, exclusive of the small dredge used in Tronoh for treating tailings. A dredge was under construction in San Francisco for a company operating near Bentong, in Pahang.

The Senior Warden of mines concludes his report with the following remarks: "The industry was carried on steadily throughout the year, and notwithstanding the decreased output, the rise in prices enables a satisfactory position to be reached; and if the demand keeps up the following year should, with cautious management, show a similar result."

Alloy From Slag.

The reclamation of ferro-alloys of manganese and silicon from bessemer and open-hearth furnaœ slag by a profitable process is reported to have resulted from research work at present carried on by two undergraduate students of the Carnegie Institute of Technology, Pittsburgh. The slag has hitherto been relegated to dumps in many cases, and used in various ways—crushed, as ballast for railroad tracks and granulated, in the manufacture of Portland cement. Now comes its entrance as a valuable by-product. An electric furnace has been developed whereby it is claimed the high priced ferro-manganese and ferro-silicon can be extracted from the slag at a reasonable cost.

After the first of the year, when the stocks of ferro-manganese in Germany were believed to have been exhausted and no more ore was likely to be imported, much speculation was encountered as to the course Germany would take in employing a substitute. Now it is generally conceded that the huge slag piles in the vicinity of Westphalia are being worked to give up their manganese.

Method of Mining Talc.

F. R. HEWITT.*

The methods of mining talc are simple, and in western North Carolina are almost entirely by open cut and quarry. The larger part of the talc of this section lies in various-sized "veins" inclosed in quartzitic walls, the majority of which have by folding been thrown into a perpendicular position, or nearly so, and the exposed edges of which have been covered by debris from erosion of the mountain above. This covering of loose rocks and earth is from 5 to 25 ft. thick, and in most cases has to be removed because it is difficult to support. Sometimes the covering is heavy enough to "catch" and timber successfully, and in this case the talc can be worked out by the usual method of following the "vein," using stulls for holding up the walls until the vein is worked out, and then allowing the cut or drift to fall in.

In some cases it proves more convenient to sink shafts and run drifts, following the talc "veins" until exhausted. The talc deposits of this section are badly broken and faulted both laterally and perpendicularly, and in some cases are found many feet below the level of drainage, necessitating pumping at considerable expense.

My own experience in mining talc has been that the chief point is to get a reliable "vein," and that then the mining is not as difficult, or any more so at least, than that of any common ore. If the veins are pure talc it is simple; if the talc is admixed with foreign matter, such as tremolite in excess, or stains of iron or manganese, as is often the case, one had better abandon the deposit.

Talc, being a soft mineral, is not difficult to reduce to the condition desired by the trade. Powdered talc is admitted under low duty from France, Italy and Austria, and some is being imported from Asiatic points. Talc is usually ground and bolted in any simple reduction mill. That mined in this section is hand-sorted and the quality that will make good powdered talc is ground for use in the manufacture of talcum powder, cosmetics, etc., while all that is hard enough and has sufficient strength is used for crayons and blanks for gas burners and electrical work, being sawed into the shapes desired. The rest that is clean and pure is ground in mills, of which many different kinds are used. Some people like the mill stone, while others prefer the many kinds of high-speed beater mills for grinding.

The manufacturing process can be summed up as follows: More or less hand-sorting may be necessary, and in grinding the talc must be reduced sufficiently to pass through a 170 to 200-mesh sieve, silk cloth reels being commonly used. Among the objectionable impurities which it is almost impossible to remove are lumps of tremolite and pyrite. They destroy the value of the talc by changing the color and making a coarse and hard gritty product which is not saleable.

Most of the talc sold is used in the paper, rubber and paint trade, while the lower grades go largely into roofing. About one-quarter of the production goes into talcum powder. Not a little is employed as a body or carrier of medicinal chemicals used in tablet form. Much of the talc or soapstone is cut with small saws into crayons of various sizes for use in the iron-working trades and on blackboards. A growing business is the manufacture of gas burners and small blocks for electrical work, which, after shaping and burning, are known as lava goods. The two last, crayon and burner manufacture, are the most important uses of talc, but the greatest difficulty is to find mineral of the proper quality, as it has to be solid, firm, and free from grit and other foreign matter.

Flat-Glass Blue-Print Machine.

In most blue-print machines, the sensitized paper passes from the roll under a curved glass and in close contact with the latter. If, thus glass is broken, as it often is, there is difficulty in replacing it. It is desirable, therefore, that the printing be done through a flat glass, which can be obtained anywhere upon short

FLAT-GLASS BLUE-PRINT MACHINE.

notice. Roy T. Giles, of Charleston, W. Va., has invented such a machine, which is shown in the sketch. The vertical glass plate is shown in section. The paper is carried through the machine and in close contact with the flat glass by a traveling apron. The two are held flat against the glass by means of a large number of horizontal, resilient pressing strips, also here shown in section.

Rand Gold Mines Close Contract for Cyanide.—

It is learned on good authority that a contract has been entered into whereby a majority of the Witwatersrand gold-mining groups will draw all of their cyanide supplies during the period of the war and for 5 years thereafter from the Cassel Cyanide Co., of Glasgow, a minor portion of this supply to be furnished by the British Cyanide Co. It is also stated that the Rhodesian mining companies will probably enter into a similar contract for their cyanide supplies. South Africa's imports of cyanide of sodium for mining uses amounted in 1913 to \$1,931,075.; in 1914, to \$1,812,430; and in 1915, to \$2,453,015.

The borax deposits of the United States are of great extent and there seems to be little danger of their exhaustion.

*Bulletin American Institute Mining Engineers.

Improved Multi-Stage Centrifugal Pump

The development of the steam turbine and the high efficiency multi-stage centrifugal pump have gone hand in hand, but up to the present it has not been entirely practicable to reconcile the speeds of the two machines so that each would work at its best efficiency.

It was necessary, heretofore, to reduce the speed of the turbine and sacrifice much of its efficiency or else speed up the pump with similar results. To overcome this difficulty the Cameron Steam Pump Works, 11 Broadway, New York, have designed and built a multi-stage centrifugal pump known as the "B-T" type.

Fig. 1 clearly shows the construction of one of these three-stage pumps. The high speed feature is a virtue of impeller design. With the ordinary impeller the diameter cannot be reduced sufficiently to get high speed without sacrificing vane length, and consequently efficiency for a certain vane length is very necessary

the pump and for displacing the air when starting. Inlet and outlet nozzles can be arranged either on the same or opposite sides—an important advantage where pumps are installed in limited space.

The shaft is made of high-grade forged steel accurately machined and ground, and wherever it comes in contact with the fluid being pumped, it is thoroughly protected by bronze sleeves, which prevent the stuffing box packing from scoring the surface of the shaft.

Each impeller is cast solid in one piece and is of the enclosed type. Surrounding each impeller hub is a pair of rings—one stationary, attached to the casing, and one revolving, attached to the impeller. By the use of double rings instead of a single ring it is possible to restore the initial tightness of the joint between the low and high pressure sides of each stage without any fitting whatever, whereas a new single ring would have to be of special diameter, and then fitted to the impeller hub, or the casing to make a tight joint.

The diffusion ring surrounds the impeller at its periphery, although it is not in contact with it. It contains a series of openings, which receive the water

FIG. 1.

in order that the impeller may perform its function without excessive loss. Small external diameter and adequate vane length are obtained in this pump, by bringing the vanes well down into the impeller hub, at the same time so turning them that the incoming water is guided smoothly, and with little loss into the outer portion of the vanes where the velocity is generated that is finally converted into useful pressure by means of the external diffusion vane. Additional advantages in the small impeller are light weight and low fibre stresses in the material.

The casing is divided along the horizontal center-line. Both the suction and discharge connections are in the lower half of the casing. The upper half is readily removable, giving full access to the revolving element. There are suitable openings for draining

FIG. 2.

from the impellers at high velocity and by means of gradually increasing area toward the periphery, reduce the velocity into pressure and enable it to advance to the entrance to the next impeller with much less loss of energy than would be the case if the high velocity of ejection were maintained.

To take care of thrust, which manifests itself in all multi-stage pumps, this pump is equipped with a simple internal hydraulic balancing device, consisting of a revolving disc attached to the shaft at the inboard or high pressure end. Opposite this disc is a stationary drum of the same diameter. Water at high pressure connects with the space between the disc and the drum, causing the disc to react against the opposing thrust, neutralizing it and holding the rotor in proper relation to the casing. The slight leakage involved in this process is piped back to the suction.

On this pump, there are two ring-oiled bearings, self-aligning, one located on each side of the casing.

The bearing bodies are horizontally split, with removable caps, and the bushings are also split and lined with high-grade bearing metal. Bushings and bearing bodies have a spherical fit, automatically maintaining the alignment of the shaft. The bearings are of ample proportions to prevent heating, and the oil chamber is of liberal capacity. The bearings are supported by strongly ribbed brackets, cast integral with the lower casing, thus counteracting any possible tendency towards even slight vibration. These brackets are located sufficiently distant from the stuffing boxes to permit of adjustment of the glands. Felt washers are provided to prevent oil escaping from the bearings.

The stuffing boxes are deep and provided with water seals, consisting of a lantern gland in each box, connected to the water from the discharge side of the pump, through a concealed passage, so arranged that it can be readily cleaned. The stuffing box gland is fitted with swing bolts to give quick and easy access to the stuffing box.

When the pump is direct-connected, it is supplied with a shaft coupling of the flexible type, to compensate for slight variation in alignment.

The bedplate under the pump is of one piece box construction heavy enough to give a rigid support, and with cross ribs to prevent distortion.

Fig. 2 shows this pump entirely assembled, and it is claimed by the manufacturers that it occupies less space than the ordinary boiler feed pump of this general type, and that it will give a much higher degree of efficiency.

World's Petroleum Output.

That 1915 was the most successful year of production in history of the petroleum industry is shown by statistics just compiled under supervision of the Geological Survey.

The total quantity of crude petroleum entering the world's markets in 1915—426,892,673 bbls.—exceeds former record, established in 1914, by 28,194,307 bbls, or 7%.

The bulk of the increase in 1915 came from the United States and Mexico, though Russia, Argentina and Japan recorded significant gains.

Distribution of this production is shown in the following table:

Country:	Quantity, '15, barrels of 42 gallons.	% of total.	Quantity, 1857-'15, barrels of 42 gallons.	% of total.
United States	*281,104,104	65.85	*3,616,561,244	60.10
Russia	68,548,062	16.06	1,690,781,907	28.10
Mexico	32,910,508	7.71	123,270,377	2.05
Dutch East Indiast.	12,386,808	2.90	148,999,921	2.48
Roumania	12,029,913	2.82	130,012,387	2.16
India	17,400,000	1.73	80,789,711	1.34
Galicia	4,158,899	.98	136,032,500	2.26
Japan and Formosa	3,118,464	.73	30,169,622	.50
Peru	2,487,261	.58	16,794,223	.28
Germany	955,764	.23	13,961,333	.23
Trinidad	1750,000	.18	2,819,430	.05
Argentina	516,120	.12	1,033,121	.02
Egypt	221,768	.05	1,308,496	.02
Canada	215,464	.05	23,709,074	.39
Italy	39,548	.01	842,020	.01
Other	110,000	.01	372,000	.01
Total	426,892,673	100.00	6,017,457,366	100.00

*Marketed production. †Includes British Borneo. ‡Estimated.

Flexible Disk Valve for Air Compressor

Air compressor valves are subjected to rapid vibrations, and it is essential that they shall open quickly under the action of the suction strokes and close just as quickly under the action of the compression strokes. A very simple valve embodying this characteristic consists of a disk of metal cut through along six radii part way to the center as shown in the accompanying illustration. There are six segments to this disk, which are free to flex to a certain extent, but without buckling action. The segmented disk is mounted in the end of the cylinder head as shown in the sectional view, the segments covering the inlet port (7). Upon

FLEXIBLE DISK VALVE FOR AIR COMPRESSOR.

commencement of the suction stroke, the segment, under its own spring action and the air pressure from the outside, flexes as shown, so that the air is admitted. The action is extremely quick and snappy. The outlet valve is shown above, being built on the same disk principle, although smaller. Upon commencement of the compression stroke, this outlet valve (15) raises and allows the compressed air to flow into the system, the inlet valve closing at the same time under air pressure. A patent (No. 1,189,969) has been allowed on this invention to William F. Meister of Marietta, O., who has in turn assigned it to the Pattin Bros. Co. of the same city.

Gem imports to New York in August were valued at \$5,535,714, the highest in history. Total for 8 months of 1916 is about \$36,000,000.

Quarter's Operations of the Butte & Superior

Due to increased wages and cost of supplies, costs of the Butte & Superior Mining Co. were higher in the quarter ending with June than in the previous quarter. The grade of ore and of concentrates produced and the mill recovery were about the same as for the previous quarter.

The following shows the principal operating

new shaft as well as that of foundations for new shaft house and equipment progressed satisfactorily and will be finished well in advance of the delivery of machinery and steel building material which will commence within a few weeks. Good progress was also made in sinking the new No. 2 or new manway shaft and on construction of the new crushing plant

MILL OF THE BUTTE & SUPERIOR CO. AT BUTTE, MONT.

factors for the quarter as compared with those of the preceding quarter:

	Second Quarter.	First Quarter.
Dry tons of ore milled.....	161,270	164,500
Average zinc contents (%)	15.9709	15.692
Average silver contents (ozs. per ton) ..	6.7041	6.844
Zinc concentrates produced (tons).....	45,194	45,121
Average zinc in concentrates (%).....	52.9956	53.122
Total zinc in concentrates (lbs.).....	47,901,445	47,938,530
Average silver in zinc concentrates (ozs. per ton)	21.8757	22.018
Mill recovery (% zinc recovered in concentrates)	92.989	92.855
Mining costs per ton	\$1.4971	\$4.0341
Milling costs per ton	\$1.7610	\$1.5763
Total cost per ton, mining and milling.	\$6.2581	\$5.6104

According to Managing Director D. C. Jackling, about the end of the quarter the No. 3 or new main hoisting shaft was connected through to the series of raises from the 1400-ft. level, thus providing a continuous and permanently timbered shaft from the surface to that level. Construction of stations for this

and improvements in ore bin facilities. Active development work was commenced on the 1700 and 1800-ft. levels and while the extent of this work is not great as yet, the size, character and grade of the ore bodies disclosed are fully as favorable as those of the levels above. Most of the work on these lower levels was confined to drifting, but even with the limited amount of cross-cutting that was done the addition to ore reserves was substantial and taken together with the additional reserves blocked out on the 1600-ft. level and above, constitute a total addition to reserves for the quarter about 30% in excess of the tonnage mined for the quarter. Developments to the east and beyond the end of the Black Rock claim have been especially gratifying and the outlook is that for some time in the future the additions to ore

reserves resultant from the usual amount of development work done in connection with mining operations will be much more rapid than the reduction of these reserves through ore extraction. Owing to the urgent necessity of rapid progress in the construction of the new shafts and the large tonnage of waste necessary to be handled, it has been impossible to do any exploratory or extraordinary development work, and consequently such work as has been and is being done is confined to that necessary in regular mining operations.

The financial results of operations for the second quarter as compared with those of the first quarter, are as follows:

	Second Quarter.	First Quarter.
Net value of zinc concentrates (at mill)	\$2,879,568.45	\$4,337,412.99
Net value of lead concentrates (at mill)		
and of residues	246,341.54	264,302.75
Miscellaneous income	22,772.34	21,427.21
Total net value	\$3,148,682.33	\$4,623,142.95
Operating costs, taxes, etc.	1,086,653.00	1,068,203.27
Profits	\$2,062,029.33	\$3,554,939.68

After the payment of the regular quarterly dividend of 75 cts. per share and an extra dividend of \$10 per share payable to stockholders on June 30, the company had net quick assets of approximately \$3,900,000.

Sales of spelter have been made for future delivery covering a substantial portion of the production for the balance of this year. These sales have been made at a lower price than that applying to the second quarter.

Treating Crude Petroleum.

A method of treating crude petroleum in a manner to secure the largest possible percentage of gasolene or vaporizable contents is described in a patent (No. 1,189,083) recently issued to Chauncey B. Forward, of Urbana, O. In the accompanying diagrammatic sketch the essential features of the system are shown.

The inventor employs no retort but relies upon outside heating sources, in this case a steam boiler being shown. The crude oil is pumped from the reservoir into the separator, passing first through a heater. The steam also is passed through a superheater, so that the two enter the separator together at superheat and

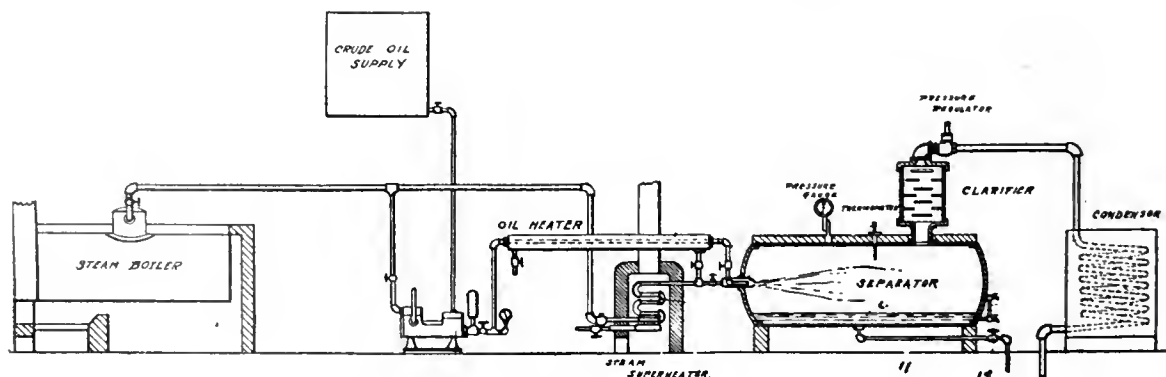

under pressure, which is variable to suit the conditions.

In the separator, the injected crude oil is vaporized and expands, the heavier products being precipitated and the oil vapors and steam being separated and flowing out together into the clarifier.

The inventor has operated this apparatus on a commercial scale at a sustained temperature of 400° F. in the separator and a pressure of 100 lbs., and claims to have secured approximately double the quantity of gasolene that is possible by any other method of treatment familiar to him. In the experimental period he made scores of runs at lower temperatures, and pressures, but as he gradually increased both and at last reached the maximum of 100 and 400° F., respectively, found that the volume of gasolene gradually increased also with the increased separating or converting conditions obtained in the separator by the higher temperatures and pressures.

While not attempting to fix definite limits, he is confident that the volume or proportion of gasolene would be profitably increased with the more intense conditions in the separator, say up to about 250 lbs. pressure, and 650° F.

Zinc Resources of the British Empire.—According to the "Bulletin of the Imperial Institute," zinc ores have been mined in many parts of the United Kingdom, notably in Cumberland, Northumberland, Durham, Derbyshire, Shropshire and the Isle of Man, but a large proportion of the production has for several years past been shipped to the Continent for smelting. By far the most important zinc deposits in the British Empire are those of Broken Hills mines, New South Wales, the output of which alone is sufficient to supply the entire demands of the United Kingdom for metallic zinc. The Broken Hill ore before the war went mainly to Germany for smelting, but the Australian government has adopted measures which will prevent this in the future. Zinc is also found in South Australia, Queensland, Tasmania, New Zealand and Newfoundland. Canada contains a number of workable zinc deposits, particularly in British Columbia, and there is every prospect of Burma becoming an important producer. In Africa there are zinc deposits which more information is needed.

METHOD FOR TREATING CRUDE PETROLEUM.

Myron A. Folsom Locates in San Francisco.

Myron A. Folsom, for the last 17 years counsel for the Bunker Hill & Sullivan Mining Co., will remove about Oct. 1 to San Francisco, where he will take charge of the marketing department of the Bunker Hill & Sullivan's new \$1,000,000 smelter, now under construction at Kellogg, Ida. He will continue to handle the company's legal business also, and the new department will combine this branch of the corporation with all business not controlled by the executive and operating departments.

It was largely through Mr. Folsom's efforts that the Bunker Hill & Sullivan Co. was enabled to engage in the smelting business, and to him more than any one else should be credited the location of the smelter at Kellogg. In fact, he was commissioned by President F. W. Bradley to overcome the transportation difficulties and solve the other problems that were factors in the situation, and that he succeeded in his efforts the construction now under way at Kellogg testifies.

In recent years Mr. Folsom has established a reputation as one of the ablest mining attorneys in the west, and he has been engaged in some of the most important cases that have been tried in the state and federal courts. He possesses a rare combination of business and professional ability, and it is in recognition of this that he has been placed at the head of the Bunker Hill & Sullivan Co.'s commercial and legal department.

Latest California Dredge.

Illustration shows the latest dredge built by the Union Iron Works, San Francisco, for Lawrence Gardella, which is in operation on Clear creek, near Redding, Calif. The dredge is equipped with $7\frac{1}{2}$ cu. ft. close connected buckets, arranged to dig 35 ft. below

the water level, and is electrically driven. The buckets are all manganese steel and have four eyes in the back. This dredge is very successful and is handling about 125,000 yds. per month.

Sulphuric Acid Plant.

The Garfield Chemical & Manufacturing Co., with principal office in Salt Lake City, has under construction a plant for making sulphuric acid at Garfield. The plant, which will have a capacity of 150 tons of acid per day, is expected to be ready for operation in October, and is costing close to \$500,000. The lead-lined acid chamber being constructed is 300 ft. in length, 100 ft. wide and 80 ft. high. The two Herreshoff roadsters to be used have been supplied by the Pacific Foundry Co., San Francisco. In these the necessary tonnage of copper sulphide ore will be roasted to liberate the sulphur, which as sulphurous fumes will be carried into the lead chamber. It is proposed to manufacture three grades of acid—60° and 66° Baumé, and a 98% acid. The main purpose in view is to manufacture acid to supply the Utah Copper Co. for its copper leaching plant, and for this purpose the 60° acid will be used. The following persons constitute the officers of the company: President, C. W. Whitley; vice-president, C. M. McNeil; second vice-president, R. G. Gemmil; secretary and treasurer, J. M. Bidwell; manager, Edgar L. Newhouse. The foregoing, together with John M. Hays, constitute the directors.

Wolframite is to be considered more in the nature of a basic phase of the refractory siliceous ore than as a separate and distinct deposit, for it always occurs in connection with them.

Copper exports from Atlantic ports for week ended Aug. 31 were 6955 tons; for August, 32,160, against 16,289 a year ago.

THE LAWRENCE GARDELLA DREDGE NEAR REDDING, CALIF.

What the Mining Companies are Doing

The Porphyry Production.

In the following tables is given the production of four leading porphyries for July, and comparisons for previous months and for the years 1915, 1914 and 1913:

Alaska Gold Mines.

President Hayden of the Alaska Gold Mines Co., who has recently visited the property in Alaska, says that while results have been disappointing there is no occasion for concern. In a recent interview he stated that he had never seen a mine more perfectly equipped in every detail—mill, power plant, transportation system, and that the low costs being obtained are something that any mine management might be proud of.

According to Mr. Hayden: "There has been but one disappointment, both to the stockholders and the officials of the property, and that is that the assay value of the ore has not been as high as that shown in development of the property before its purchase, and which was actually being obtained at that time.

"When the property was purchased the mine had been opened up by what was most natural, rational and normal method of development, viz.: the driving of a crosscut tunnel from the Silver Bow basin, where water power was available and where there was a natural mill and townsite, to that point in the middle of the mountain where such a tunnel driven perfectly straight would cut and cross the vein. Im-

mediately on passing into the vein the property was opened up along it both to the east and west for a distance of some 2000 ft. and stoping operations were begun and continued without any attempt towards or possibility of selection; and from 1907, in a small mill which could only run during summer months on account of inability to get power, nearly 400,000 tons of ore were treated which had an average grade of \$1.80, corresponding to a recovery under our present methods of milling of better than \$1.55 per ton.

"Summing the whole situation up, it is fair to say that the results up to date have been somewhat disappointing, but viewing it in the light of the more perfect information we now have, the financing, development and equipment of the property on its present showing and to the present extent is fully justified from every viewpoint, and the same people who have been responsible for these things would do the same thing if they saw the property as they see it today instead of as they saw it at the beginning."

Shattuck-Arizona.

The following is a summary of the mine and smelter production and costs for the quarter ending June 30, 1916:

	Copper ore.	Lead ore.
Dry tons mined	42,174	643
Dry tons shipped	42,338	634
Dry tons smelted	42,625	511
Pounds copper recovered		4,196,873
Ounces gold recovered		1,047
Ounces silver recovered		70,350
Pounds lead recovered		192,459
Net operating cost per pound of copper		10.09c
General office expense and taxes paid		.35c
Total net cost per pound refined copper		10.44c

Earnings for the quarter were as follows:

Gross value of all ores	\$1,205,741.26
Miscellaneous receipts	1,307.30
Interest received	731.81
Gross earnings	\$1,207,780.37
Operating expense	\$502,725.31
General office expense and taxes paid	15,439.12
Net earnings	\$ 689,615.94

During the quarter dividends amounted to \$437,500.

No. 15—April 20th, 1916	\$175,000
Extra, No. 3—April 20th, 1916	262,500
A total of	\$437,500

Miami Copper Co.

During the first half of the calendar year 1916 there was mined 850,550 tons of ore and there was treated in the concentrator 850,485 tons, which produced 32,213 tons of concentrate having a copper content of 41.80%.

The gross production of copper contained in the concentrate for the half year amounted to 26,931,915 lbs., divided as follows:

	Lbs.		Lbs.
January	4,097,333	April	4,330,882
February	4,141,286	May	4,978,243
March	4,459,783	June	4,924,388

From the above the smelter deduction of 5% gives the net production of merchantable copper as 25,585,314 lbs. The average assay of the ore treated during the period was 2.086% copper. The concentrator extraction was 71.44%, this being the copper contained in the concentrate, as compared with the copper contained in the ore. The saving of copper in the concentrate was 31.38 lbs., or in final merchantable copper after smelter losses, 29.81 lbs. per ton of ore treated. The grade of the concentrate produced, as above noted, was 41.80% copper.

In the concentrator continued improvements have been made along the line of fine grinding and increased tonnage. The three Chile mills in Sec. 5 are to be replaced by two large Hardinge mills using steel balls and it is expected that

the capacity of this section will be well up to 1000 tons per day.

With finer grinding and the expected increase of production up to 5,000,000 lbs. of copper per month, comes the need for more power and the company has ordered three Nordberg Carls Freres Diesel engines, each of a capacity of 1250-hp. sea level rating. These with our three Nordberg steam engines will give ample power and a spare unit. A high degree of economy is expected from the Diesel engines.

The average cost of copper for the period, after deducting miscellaneous income, is 8.9526 cts. per pound. The estimated profit and loss figures for the period are given as follows:

Gross income	\$5,810,257.45
Cost of plant operations.....	\$1,624,972.40
Smelting, refining, selling, etc.....	628,341.19
Administration, legal expense, interest, taxes	57,803.37
	<u>2,310,616.96</u>
Balance being estimated profit 6 mos. ended June 30, 1916	\$3,499,740.49
Less: Dividends Nos. 14 and 15.....	2,054,563.50
Surplus for half year.....	<u>\$1,445,176.99</u>

West End Con. Co., Nevada.

The report of the West End Con. Mining Co. for the year 1915 shows as follows:

Receipts—	
From ore reduction.....	\$880,642.05
Loans and accounts collectible.....	23,433.45
Interest collections	8,512.78
Dividends from Nevada Mill Co.....	30,000.00
Dividends in trust for Tonopah Ext. Mill and Mining Co.'s shareholders	1,332.50
	<u>\$943,920.78</u>
Disbursements—	
Advances to superintendent.....	\$510,000.00
Legal expense	780.95
Office expense	6,431.10
General expense	2,272.26
Ore purchases	44,073.76
Taxes	1,677.86
Dividends	178,848.60
Prospecting	3,182.71
Loans receivable	34,022.97
Mill rental	30,000.00
Deposit in escrow of net proceeds derived from Jim Butler and West End Con. Co.'s disputed ore.....	76,230.63
10,000 shares Alcyone Mg. Co.'s stock.....	500.00
Mason Valley mines.....	1,335.30
Halfax Tonopah Mg. Co.'s stock.....	38,727.15
	<u>\$928,083.29</u>
Balance Dec. 31, 1915.....	<u>\$122,329.50</u>

Miscellaneous Company Notes.

The Copper Range Co. has secured an option from the St. Mary's Mineral Co. on approximately 6 square miles of territory south of the Globe tract. A general exploration of this territory will be made. The land has a heavy overburden with no outcrop and no particular lode will be sought, but the mineral contents will be sought through diamond drill operations.

Now that Shannon's treasury has been strengthened it is expected that a dividend will be paid soon. Under present conditions the company is earning over \$3 per share annually. In the 7 months ended July 31 Shannon produced 5,364,570 lbs. of copper and earned \$190,000 net, or about \$1.60 per share on 300,000 shares. In that period net working capital increased from \$580,000 to \$1,070,000.

The property of the Ohio Copper Mining Co. has been sold for \$750,000 to a representative of the bondholders' committee. Not for 6 weeks, however, will the Federal Court in Salt Lake City confirm the proceeding or order it vacated, as a stay for that period has been granted by the Federal Court in New York on petition of stockholders not satisfied with the bondholders' proposed plan of reorganization. The New York court has ordered the Ohio trustees to give to stockholders' representatives a complete list of registered holders of both stock and bonds in order that their views on reorganization may be secured. From present indications two stockholders' committees will come into the field. The stock can be assessed \$2 per share should it be found necessary to have been so profitable that trustees and receivers are under-

stood to have about \$400,000 cash on hand, against about \$60,000 unsecured liabilities.

It is understood that the profits of the American Zinc, Lead & Smelting Co. for the month of July were better than \$900,000. This compares with \$871,784 for the two previous months. It is predicted that for the 12 months to the end of Dec. 31, American Zinc will show profits of \$10,000,000. This sum would be equal to \$46 per share on 193,000 shares of common stock after interest on \$2,000,000 bonds issued in connection with the Granby purchase and \$6 per share on 100,000 shares of American Zinc preferred.

The Anaconda Copper Mining Co., through its subsidiary, the International Smelting & Refining Co., has purchased the raise new working capital, but operations during the past year old Walker copper properties in Plumas, Cal., paying, it is reported, \$670,000. The property is developed only to a very limited extent. It consists of 16 claims, heavily timbered, with good water power available 18 miles northeast of Portola, Cal. The ore carries 6% copper, 3 ozs. silver, and \$1 in gold to the ton. It is considered a very promising property. The ore will be shipped to the International smelter at Tooele, Utah.

The 60 days' time given by the Michigan law in which mining company stockholders have the privilege of paying an assessment has expired on the Algomah Mining Co. assessment of \$1 per share which was due May 18. Under the Michigan statute stockholders now wishing to pay the assessment are chargeable with interest from the date the assessment became due. Under the terms of the underwriting agreement the company will soon be obliged to advertise all delinquent stock for sale. After notice of sale is published stock can be redeemed until date of sale only upon the payment of costs incurred in addition to the assessment and interest due.

The Nevada Con. Copper Co. is spending about \$500,000 to increase its mill capacity. Some additions will be made to the crushing department and some of the rolls will be discarded. The average mill run during July is reported to have been 12,000 tons daily and the average of the ore 1.9% copper. This is one of the highest yields ever made from this property and it is due in a measure to the fact that 2000 tons of the ore daily were produced from the Ruth mine. The average of the Ruth ore is given as 2.2%. This is some of the best ore that has ever been mined in Nevada Con. ground. The mill extraction is now 73%, which is an increase over former operations.

The Arizona Commercial Copper Co. produced in the 6 months ended June 30 2,251,000 lbs. of copper and earned approximately \$334,000 net, or \$1.25 per share on 260,000 shares outstanding. The company consequently had on June 30 net working capital of over \$550,000 compared with \$262,000 on Dec. 31, 1915. Production continues to be maintained at 300,000 to 400,000 lbs. per month, any increase being dependent upon the completion of the power plant a month or two hence. Deliveries of this equipment have been delayed, but are now commencing to come forward. Underground conditions show steady improvement. The 14th level, the deepest in the mine, is developing more ore and of higher grade than any other level in the property.

A. E. Carlton, Cripple Creek, has been elected president of the new Cresson Con. Mining & Milling Co. The deal for the purchase of the Cresson from its Chicago owners was recently consummated by Mr. Carlton, whereby the majority of the stock was taken over by the new company formed mostly of Colorado men. The remainder of the stock will soon be in the hands of the new company, it is said. Mr. Carlton is also president of the Golden Cycle Mining & Reduction Co. The other officers of the new Cresson Co. are: Claude Boettcher, Denver, vice-president; A. F. Zang, Denver, secretary, and E. P. Shove, Colorado Springs, treasurer. The officers, with the following, comprise the board of directors: T. B. Burbridge, Denver; Charles M. MacNeill, Spencer Penrose, Colorado Springs; Irving T. Snyder, Adolph Zang, Denver; L. G. Carlton, Cripple Creek, and Richard Roelofs, Cripple Creek.

THE MONEY-MAKERS.

I

Owning a block of mining stock,
 To the uninitiated
 Means no one home within the dome
 Where intellect is crated.
 Just why it's so I hardly know.
 But I have heard repeated
 That mining schemes are wiley dreams—
 Air bubbles, super-heated.

2

When sharpers thrive, and so derive
 A bank account unlawful,
 They seek the fools to be their tools,
 And put it over awful.
 It's my surmise, 'till all are wise
 The sharpers won't be grieving,
 But everywhere, will do their share
 Of plain and fancy thieving.

3

Now as to facts, I wouldn't tax
 Your mind with figures tiring,
 But in the end, the dividend
 Is what we're all desiring;
 And if perchance you ever glance
 Where mining stocks are listed,
 You'll recognize, with some surprise
 You've been a bit close-fisted.

4

Those figures that I hinted at
 Were dividends in mining,
 For to July the year gone by
 In profits has been shining.
 You multiply a million by
 At least one hundred fifty
 And you will say the miners pay
 Disbursements truly nifty.

 Dividends of Mines and Works. 485

*Illustrated.

Dividends of Mines and Works Con-
 tinue of Record Proportion.

August proved an exceptionally good month for holders of stock in American mines and works, for, according to reports made to Mining & Engineering World, \$16,983,721 in dividends were disbursed. Quite a number of new companies entered the dividend-paying list, among them being the United Verde Extension Copper Co., First National Copper Co., Mass Con. Mining Co., Utah Metal & Tunnel Co. (which absorbed the Bingham-New Haven), and the South Hecla.

During the 8 months of 1916 ending with August, 143 companies have paid dividends totaling \$169,716,976. Since incorporated these 143 companies have divided among shareholders no less than \$1,171,935,237. The combined issued capital of these companies amounts to \$890,251,861.

Of the above 143 companies 36 operate copper properties which have enriched shareholders so far in 1916 to the extent of \$65,024,878, the August copper disbursements totaling \$8,698,141. To date these 36 companies have to their credit in dividends paid, \$635,932,570. This is on an issued capitalization of \$332,209,078.

Gold-silver-lead-zinc properties divided among shareholders in August \$7,652,391. For the 8 months of 1916 holders of stocks, with 107 companies participating, received \$61,599,989. To date these companies have paid dividends totaling \$382,311,072, on an issued capital of \$332,209,078.

Eighty-four of the above 107 companies operate properties in the United States and they have paid dividends so far in 1916 amounting to \$55,595,257. August dividends total \$6,861,499. The total for these companies is \$254,510,556. Twenty Canadian companies in this class disbursed during the 8 months of 1916, \$6,302,722. August disbursements total \$633,665. But three Mexican companies report as having paid dividends in 1916, these amounting to \$986,402.

Metallurgical companies, six in number, have paid dividends for this year totaling \$13,481,113. Since incorporation these companies have shared with stockholders \$207,139,683.

In addition to the above dividends are those of the companies classed as securities-holding corporations, eight of these dividing among shareholders during 1916, \$29,293,022. Since incorporation these companies have paid dividends totaling \$146,744,136.

Then might be added the dividends paid by corporations giving out no reports of disbursements, which would add several million dollars to the month's disbursements. Privately owned properties, which are yielding goodly profits to their owners, would add as much more, making total disbursements for the month easily in excess of the \$20,000,000 mark.

In the following table is listed the companies pay-

ing dividends in August, giving the date of payment, amount per share and total amount paid:

	Aug.	Amt. per share.	Amount paid.
American Z., L. & S., Mo.....	1	\$1.50	\$342,180
Amparo, Mex.	10	.05	100,000
Anaconda, Mont.	28	2.00	4,662,500
Big Four Expl., Utah.....	5	.05	20,000
Bunker Hill Con., Calif.....	4	.02½	5,000

Yellow Pine, Nev.....	25	.10	100,000

The Copper Market.

The copper market is reported firm with leading producers and sellers asking 28 cts. a pound for November-December delivery, and 27 to 27¾ cts. a pound for delivery in the first quarter of 1917. Small producers and sellers, while asking 28 cts. for November delivery, continue to shade the December quotations to 27¾ cts., but they hold first quarter deliveries firm at 27 cts.

Announcement of the suspension of negotiations in the big Allied copper order amounting to 300,000,000 to 400,000,000 lbs. for delivery next year was made last week. The information did not cause any weakening in the copper situation. The Allies had simply missed their market by procrastination. Efforts to haggle over the price asked by the producers failed of success, in view of the heavy general buying of the red metal which not only acted to sustain the quotations given to the warring powers, but caused the producers to withdraw the option given to the purchasing agents without extension of the time.

The Allies *must* buy copper and their orders *must* be placed here. This, in sum, is the situation. Producers of copper have shown no desire to press this sale of copper. The market is not a buyer's one and it is either a matter of conceding the price asked or going without. On this basis the producers have refused to solicit orders for the red metal.

In fact the situation for this year is one where producers are experiencing great difficulty in supplying the wants of their favored customers. Thus with the current market extremely tight and the prospect

that the hostilities will continue into the summer of next year producers are maintaining a solid front on future business.

Manufacture of Electrochemical Products Increase Largely.

Electrochemical and electrometallurgical products enter into almost every phase of our industrial life and their manufacture has been increasing by leaps and bounds. The chief products made by the aid of the electric current are aluminum, phosphorous, silicon, sodium, graphite, chlorine, oxygen, hydrogen, ferro-alloys, copper, titanium, vanadium and other alloys, calcium carbide, carborundum, and other abrasives, caustic soda, caustic potash, sodium, peroxide, chloride of lime or bleaching powder, carbon bisulphide and muriatic acid.

According to a report issued by the U. S. Bureau of Census, the value of electrochemical products has increased from \$18,450,000 in 1909 to \$29,600,000 in 1914, an increase of over \$11,000,000. This does not include iron and steel made in the electric furnace, which also falls under this class. The extent to which we are dependent on electrochemical products is little realized. The manufacture of these products has been steadily increasing but today the supply is far short of the demand, due in many instances to the inability to obtain permission from the Government to use more power at Niagara Falls, the great electrochemical center. Of 36 establishments reporting in 1914 manufacturing electrochemical products, 18 were located in New York, four in Michigan, three in California, two each in Pennsylvania and West Virginia and several other states having one each. Most of the plants in New York state are at or near Niagara.

Portland cement has made possible the easy solution of some troublesome problems in underground mining operations as well as on the surface. Sinking shafts through wet ground, for example, has always been a troublesome and expensive operation, but this has been greatly simplified by the use of Portland cement to shut off the inflow of water that percolates in through fissures in the rock being penetrated. As this water may be under considerable pressure the difficulty of sealing the fissures at once becomes apparent. A method of closing these water channels by forcing cement into the rock in advance of the drills by means of a powerful pump is said to effectually accomplish the desired object.

Rates on iron ore from lower Lake Erie ports to Ohio, Kentucky, West Virginia, and western Pennsylvania have been pronounced generally unreasonable by the interstate commerce commission. Carriers were directed to make separate charges for dock, storage and switching services.

PERSONAL.

F. E. Wormser is with the Snake River Mining Co., Huntington, Ore.

Noel Cunningham, consulting metallurgical engineer, has opened offices in New York.

Charles Harrington is now general manager of the Over-all Mining Co., Dove Creek, Colo.

H. H. Miller, managing property in El Callao district, Venezuela, has returned to Los Angeles, Cal.

A. Chisholm, Ironwood, Mich., has been appointed assistant superintendent of the Newport mine.

Roscoe Edyvean will leave the Transvaal, South Africa, about Sept. 16 and return to Calumet, Mich.

Arthur Redner has been made superintendent of the Anvil mine of the Newport Mining Co., Bessemer, Mich.

G. L. Sheldon, Salt Lake, Utah, and Ely, Nev., is examining property in San Bernardino county, California.

R. B. Lamb, mining engineer, New York, will return from a trip to Nevada and California about Sept. 15.

H. K. Najarian is now engaged in designing work for the smelter of the Missouri Cobalt Co., Fredericktown, Mo.

F. A. Kroll, chief mining engineer at the Eighty-Five mine near Lordsburg, N. M., is visiting his old home at Houghton, Mich.

W. D. Manchester, Rocky Hill, Conn., has been appointed crushing superintendent for the Chile Exploration Co.'s plant at Chuquicamata, Chile.

A. G. De Goyler, New York, has been appointed general manager of the Vernon Mining Co., and will remove his headquarters to Ironton, Colo.

W. F. Jahn, formerly with the Honduras Rosario Co., Honduras, is now mill superintendent for the Tough-Oakes Mines Co., Kirkland Lake, Ont.

John M. and Hamilton W. Baker, formerly general manager and superintendent of the Baker Mines Co., Baker, Ore., have resigned and removed to Denver, Colo.

J. Parke Channing of New York, managing director of the Miami and president of the Naumkeag Copper Co., is in the Michigan copper country inspecting operations at the latter.

N. H. Emmons, former assistant manager of the Tennessee Copper Co., Copperhill, Tenn., has been appointed manager to fill the vacancy made by the resignation of J. B. Risque.

W. E. Greenough will engage in a consulting mining engineering practice with offices in Spokane, Wash. He was formerly managing director of the Marsh Mines Con., Wallace, Ida.

J. L. Bruce, general manager of the Butte & Superior Mining Co., has returned to Butte, Mont., from Rochester, Minn., where he underwent an operation for appendicitis. He has fully recovered.

Frank M. Estes, northwestern representative of the American Smelting & Refining Co., Spokane, Wash., is now in Alaska and on returning will be made general manager of the company's interests in Chile, S. A.

C. F. Sherwood, formerly metallurgist for the Butte-Superior Mining Co., and later general manager of Butte-Duluth mines, Butte, Mont., has opened an office and metallurgical laboratory at 222-23 Dooly building, Salt Lake, Utah, for ore testing and practice as a metallurgical engineer. Mr. Sherwood more recently worked out the process for sulphidizing and treating by flotation the carbonate mill tailings of

the Prince Con. at Bullionville, Nev. Many Montana operators will remember Mr. Sherwood.

William and Thomas P. Walters, Jr., left the employ of the Jones & Laughlin interests Sept. 1 and will be in Ishpeming, Mich., for the present.

E. B. Grant, assistant professor of the Physics and Mathematics department of the Michigan College of Mines, has had conferred on him the degree of doctor of philosophy by the University of Chicago.

J. Lebarthe, metallurgical engineer, San Francisco, Cal., is in charge of smelter construction for the Bunker Hill & Sullivan Co., and has been in Spokane, Wash., on his way to Homestead, Ore., where his company is erecting a mill.

G. H. Abeel of Ironwood, recently with the Pabst mine, and Garret F. Johnson, of Hancock, recently instructor in the department of mining at the Michigan College of Mines, have become members of the engineering staff at the Quincy.

SCHOOLS AND SOCIETIES.

Minnesota Joint Engineering Board.—The Engineers of Minnesota believe that through the co-operation of the various engineering societies that they can be more useful to their communities and are attempting to bring about closer co-operation through the formation of the Minnesota Joint Engineering Board. The constituent societies represented on the board are the Northwestern Association of the members of the American Society of Civil Engineers, Minnesota Section of the American Society of Mechanical Engineers, the Minnesota Section of the American Institute of Electrical Engineers, the Minnesota Surveyors' and Engineers' Society, the Engineers' Club of Minneapolis and the Civil Engineers' Society of St. Paul. It is hoped that through this central organization the activities of the engineers of Minnesota may be more closely correlated and more accomplished for the public welfare. Geo. W. Rathjens of St. Paul is the secretary of the board.

American Electrochemical Society.—At the coming convention of the American Electrochemical Society, which will be held in New York Sept. 27 and 30, one of the sessions will be devoted to "Made in America" products of the electric furnace and electric cell. These products include many of our most important staples, such as copper, aluminum, abrasives and many more. It is an interesting fact that whereas other chemical industries, such as the coal-tar dye industry, are distinctly European, the electrochemical industry is decidedly American. It is here in America where the production of aluminum was invented and put on a commercial basis. The first plant for the electrical synthesis of the elements of the air and the production of artificial fertilizer nitrate was erected at Niagara Falls. Here at the falls, also, tons of abrasives are produced in large, powerful electric furnaces. The importance of these abrasives can best be appreciated by the fact that if the supply from the falls were to cease today practically every mill and factory in the country would have to shut down within 3 months' time. Other electrochemical products of decided economical importance and value are graphite, phosphorus, hypo-chlorite of lime, magnesium, metal, carbon bisulphide, calcium carbide, hydrate of sodium, ferrosilicon and other iron alloys which are indispensable to the steel trade.

American Chemical Society.—The fifty-third meeting will be held in New York city Sept. 25 to 30, inclusive. The meeting will be held in conjunction with the Second National Exposition of Chemical Industries. The American Electrochemical Society and the Technical Association of the Pulp and Paper Industry will hold meetings in New York city during the same week. It is expected that 2000 to 2500 chemists will be in attendance during the week's exercises, and that this meeting of the American Chemical Society will be the banner chemical meeting of the world. No comparative opportunity for reviewing the progress in the nation's chemical industries has ever been offered.

TRADE PUBLICATIONS.

Oil Filtration Systems and Equipment. S. F. Bowser & Co., Inc., Fort Wayne, Ind. Booklet; pp. 51; illustrated.

With the ever-present call for efficiency and conservation the question of re-using lubricants should not be ignored. In this booklet many different styles of filtration and circulating systems are described, the redeeming features and uses of the system being spoken of. The operation and construction of the system is given a concise explanation and some of the accessory parts are described. Drawings showing oil connections on engines and an isometric view of a complete oil filtration and circulating system, including the machinery to which the oil is circulated, are reproduced.

Spraco System for Cooling Condensing Water. Spray Engineering Co., Boston, Mass. Booklet; pp. 16; illustrated.

An account is given in tabulated form of results obtained by a test on the Spraco system. One of the tests was made on a typical winter day with the temperature at from 16 to 30 degrees; a second on a spring day, with the temperature from 56 to 70 degrees; a third on a summer day at from 90 to 102 degrees, and the last on a power plant in southwestern United States in July with the temperature at from 85 to 93 degrees. With illustrations of installations the remaining pages are confined to a description of the system, its operation, installation and superior points. The superiority of condensing operation of plants in a general way are also brought forth.

Appliances for Burning Fuel Oil. Tate, Jones & Co., Inc., Pittsburgh, Pa. Catalog; pp. 31; illustrated.

This catalog gives considerable practical information as to general oil-burning practice and a comparison brings out the superior points of the use of oil for fuel instead of coal, etc. Oil is superseding coal in many mining districts because of its greater abundance in the immediate vicinity. This, however, is stated as being of minor importance in view of the fact that oil is cheaper, because 25% more heat units are procurable from it, the reasons for the discrepancy being brought out in the catalog, with other reasons for the superiority of oil. Part I is confined to listing different types of oil-burners and in connection with each an illustration is given accompanied with description and detail information. In this connection drawings and views are given showing complete metallurgical and boiler furnace installations using oil burners. Part II is on equipment for pumping oil to the burner. Systems are described as well as different types of pumps and equipment, and are illustrated and accompanied with tables of details.

INDUSTRIAL AND TRADE NOTES.

The Colorado & Eastern R. R. Co., a line running out of Denver to Scranton, Colo., was recently purchased by the Morse Bros. Machinery & Supply Co., of Denver. They will dismantle and ship all the rail, locomotives, etc., to Denver for resale. Twenty years ago this railroad was sold to a New York syndicate for over \$1,000,000.

COMMUNICATIONS.

[This department is for the exchange of ideas bearing on all branches of the mining and metallurgical industries. Mining and Engineering World will not be responsible for the statements made nor opinions expressed by correspondents.—Ed.]

Acetylene Trust.

The Editor: We have recently been confronted with a raise in price of acetylene for lighting purposes, with the statement that "on account of the war, etc." I am wondering what the "war" has to do with this commodity, made entirely in the United States. There seems to be no doubt

but what the acetylene trust has the industry by the throat. While the government is doing its investigation, why not look into this branch, so vital to our industry? Who is the trust composed of anyway?
MINER.

A Vanadium Monopoly.

The Editor: Under the headings of "Realization of Vanadium Co.," "Vanadium Co. Sold for \$7,000,000," etc., notices have lately appeared in the daily press, in which the American Vanadium Co. claims to control about 92% of the known vanadium deposits of the world, through ownership of mines in the Peruvian Andes.

This statement is hardly convincing to anybody conversant with the existing extensive technology on this metal. It is only necessary to consult the recent publications on this subject, besides the series of articles I have contributed to the Mining and Engineering World since 1904, to be aware that vanadium is an element widely distributed, forming large deposits in several of the geological formations in the American continent, in Europe, in Australia and elsewhere.

To own about 92% of the actually known vanadium in the world appears to be a rather large order, quite as good as controlling 92% of the copper or zinc deposits of the United States, not to say of the world. A vanadium monopoly is out of the question, as there exists large areas in which this element is found in large quantities.

In this country there are several other interests working vanadium independently from the American Vanadium Co., without mentioning outside interests, which are also well known.

The high prices of vanadium, due to actual conditions in the metal market, are not likely to continue in normal times. The extraction of the vanadium pentoxide used in the manufacturing of high-grade ferro, of steel vanadium with an average of 0.25% vanadium, is now a simple metallurgical operation which can be performed at a reasonably low cost and will allow the sale of vanadium alloys at a price far below the prices ruling before the European war.

It is not wise to base the earning capacity on actual abnormal, inflated prices, which are always temporary and which will fall considerably, like many other industrial commodities, at the termination of the present war.

BANERES DE ALZUGARAY.

New York.

NEW PUBLICATIONS.

Some Manganese Mines in Virginia and Maryland. By D. F. Hewitt. Washington, D. C., U. S. Geological Survey. Bulletin 640-C; pp. 35; illustrated.

The nature and genesis of the deposits with a general geological description of the country is brought out in the first few pages. Descriptions of some of the properties then follow in which some details are given on the methods and results of their operations.

The Underground and Surface Water Supplies of Wisconsin. By Samuel Weidman and Alfred R. Schults. Wisconsin Geological Survey, Madison, Wis. Bulletin No. 35; pp. 664; illustrated.

General conditions affecting water supplies and their chemical contents is first dealt with. The second part deals with the water supply by separate counties. Under each county a description of the geological formation, water supply for cities and villages, and quality of water and analysis is given.

Boston Creek Gold Area and Goodfish Lake Gold Area. By A. G. Burrows and P. E. Hopkins. Ontario Bureau of Mines, Toronto. Bulletin No. 29; pp. 24; illustrated.

These two areas are located in the Temiskaming district, about 45 miles northwest of Cobalt. A description of the general geology and nature and occurrence of the ore deposits is given for each area. This is followed by a brief description of the genesis of the ores and some of the more important prospects and mines.

Late News From the World's Mining Camps

Editorial and Special Correspondence.

ALASKA.

Seward.

In reviewing part of his trip Ben Bernard, general manager of the American Dredge Building & Construction Co., says the McKinley district looks good from a dredging point of view because as the gravels contained in many of the gold-bearing streams of the district were entirely free from boulders and hard pan, and particularly favorable for handling by means of the smaller sized dredges which with transportation facilities make it advisable to install. "We now have a crew of men drilling several of the properties and if the results show sufficient values a dredge will be installed. The rapid advancement of the railroad to its present terminus from Seward will greatly facilitate shipments of material for construction enabling shipments to be made from Seattle to Seward during the winter months, and after transporting by rail to the end of the railroad the material can then be taken over the winter trails at less cost than is possible during the summer."

Iditarod.

In considering the recent finds on the Boob and Mastodon creeks it is stated by some that the Tolstoy district is perhaps not worthy of all its praises. A brief review shows that Strandberg made pannings on No. 2 below, Boob creek, taking 3 pans from the dump and 3 from the bottom of the shaft. They gave a total of \$1.80, which would indicate a value of \$2.50 per ft. The gold is coarse and there is 3 to 4 ft. of gravel. J. S. Pitcher has pay in two shafts, one on the upper end of discovery and one near the upper end of No. 1 below. On the Emmet fraction they have better than \$3 per ft. It is getting better, but nearly all prospecting is at a standstill. Schwartzdahl exhibited gold panned from his claim which was flat and heavy and had run through 3 ft. of gravel. His pannings show results from 19 to 50 cts. This was on shallow bench ground averaging 10 ft. deep. The creek bed is wet, and there has been little or no prospecting there. Geer & McNulty, on Boob creek, have struck pay. They had 3 ft. of gravel that panned 6 to 35 cts. There are about 20 men on that creek, with 3 small boilers. The ground is said to be all frozen, and there is a depth of 35 ft. to bedrock. Some reports state that a small gasoline boat can get within 4 miles of the strike. A townsite, known as Cooper, has been located at the mouth of Mastodon creek, and supplies will be taken there when navigation opens. Two large scrapers will be operated next season, one by the Kuskokwim Commercial Co. and the other by Al Poormeister. The ground has been thoroughly prospected, and there is little doubt that they will make a showing. Cook & Co., in the Poorman district, near Ruby, have 6 ft. of dirt on the dump that will average 75 cts., per pan. Kickbush & Davis are working on ground that will go \$3 per ft., and good pay has been found on Spruce creek.

Juneau.

Alaska Gold Co.'s reports show that in the year ended Dec. 31 the company treated 1,115,291 tons averaging \$1.15, with losses in tails of 21.9 cts. It so happens that for the 8 months ended July 31 (including the month of December, 1915, when monthly statements were begun) the tonnage treated and the average grade of ore were practically the same as for the period covered by the annual report. For the 8 months referred to ore treated was 1,176,097 tons of an average grade of \$1.17. If losses in tails be estimated at 22 cts., the net recovery is found to have been 95 cts. In 1915 average mining, milling, smelting and miscellaneous costs were 71 cts. This does not include the entire cost of development,

as on Dec. 31 last there was a charge of \$574,690 for this work which had not been absorbed into operating expenses.

ARIZONA.

Oatman.

Two new important strikes have been recorded in the district during the past week. One of these is in the west drift of the Oatman Gold Mining & Milling Co., on the 500 level, where Chas. T. Arkins of Chicago reports average values for the length of the drift of better than \$15 gold. The ore shoot was encountered a little closer to the shaft than had been expected, and the operators believe that values will increase as the central part of the shoot is neared.

In the Lexington, at a vertical depth of 100 ft., a 6 ft. vein has been encountered which is reported to show $2\frac{1}{2}$ ft. of ore averaging \$14.50. A complete sampling of the vein exposures shown in the five shafts on the Lexington property has just been made. The shafts tap the vein at depths varying from 100 to 165 ft. along a stretch of 4000 ft., and the values and conditions revealed are very favorable. Work of continuing the main shaft down to the 500 point is now in progress.

The Black Range has suspended operations for a few days. Future development plans are now being perfected in Chicago by the syndicate which recently assumed control of the property.

Pending the completion of arrangements being made by the Lucky Boy Co. work has not been resumed on the property, but the operators state that there is little doubt that work will be started within a few days.

Development work is steadily progressing in the Big Jim on both 400 and 485 levels, and official statements as to the results of this work indicate that the property is developing into one of the important gold mines of the southwest. The last advice as to values covers the work of the past 30 days. It is stated that 69 mine samples, representing 160 ft. of new drifting on the 400 level and 180 ft. on the 485 level, gave an average value in excess of \$20. The ore shoot has been opened for a distance of about 375 ft. on the two levels, and all ore exposures on the two levels are stated to show average values of \$20, free milling gold. Sometimes the average runs a little below \$20, and again it will run a little above that figure, but it is well maintained. Upraises from the two levels are planned and have already been started from the 400 level with a view to finding the apex of the ore shoot. It is notable that in the Tom Reed mine, adjoining, the highest values were found at about 300 ft., then they decreased until about 500 ft. was reached, and then increased to 750, when they exceeded those at the 300, and thereafter remained very constant. Similar conditions appear to prevail in the Big Jim mine, and assay maps of corresponding levels in the Big Jim and Tom Reed mines show apparently identical values and conditions.

News of the final consummation of the transfer of the control of the Carter to an eastern syndicate is expected this week. In the meantime work on the property is not extensive.

The United Eastern has completed its retaining wall, 18 ft. in height, extending the entire length of the site of its cyaniding plant. The mill is being constructed. The new 3-compartment shaft is now down 435 ft., and has been connected with one of the laterals from the old working shaft, affording an air connection. Machinery for the mill is arriving daily.

Negotiations for the refinancing of the Gold Range Co.

are under way, and the officials state that they hope to resume work in the near future. It is intimated that money for a broad development campaign has already been pledged. This is one of the most attractive looking properties in the central part of the district and resumption of work on it will stimulate development in adjoining properties.

United Northern is crosscutting on the 400 level, and because of the stringers of highly oxidized hematites and quartz showing, Engineer Goldsworthy believes that the cut is very close to the vein and that good values will be found when it is penetrated.

Officials of the Tom Reed Mining Co. state that bullion valued at \$65,000 has just been shipped to the mint as the result of 2 weeks' clean-up. The mill is steadily running at full capacity, and insiders are predicting a resumption of dividends in the near future.

Esperanza and Lazy Boy are now working three shifts, sinking, after having been inoperative for some time.

Adams, Nellie, Murdock, Arizona Central, Hi Henry, Jerome Oatman, North Star, United Western, Midway, Oatman United, Sun Dial, Oatman Amalgamated, Oatman Syndicate, Arizona Tom Reed, Pioneer, Arizona Rex, Blue Bird, Boundary Cone, Chicago Syndicate, Ivanhoe, Iowa, Oatman Combination, Oatman Crescent, Telluride, Tipperary, and Wrigley Exploration are steadily operating.

Gold Reed is drifting and crosscutting on the 500 level and is reported to be opening satisfactory bodies of \$10 to \$18 ore. Mill tests of some of this ore are now being made.

Gold Ore is steadily developing, although milling operations have been checked by labor troubles at the Gold Road plant, which has been treating the ore from this property.

Gold Dust is steadily blocking out ore on two levels, while Gold Key, adjoining, is also reported to be placing a considerable tonnage of pay ore in sight.

Although it is reported that the Times Co. is well financed, operations have been discontinued. It is intimated that some change in the personnel of the company officials is pending, and that by the first of October operations will be resumed.

By the middle of September the hot weather will have been broken, and mining operations throughout the Oatman district will be materially increased. Already many operators who left on account of the hot weather are returning and preparing to resume work.

Jerome.

Sampler and smelter returns show 3,500,000 lbs. of copper from United Verde Extension (Little Daisy) during August. These figures correspond closely with the copper matte figures for July. The ore tonnage shipped during August was considerably less than July, showing that the average copper content of the ore was higher. The winze being sunk on the 1400 level is down better than 80 ft. in ore which carries from 20 to 50% copper. Native copper is a feature in the winze and the level above.

With the pump on the 700 level of the Jerome Victor Extension shaft, it is only a question of days now until the workings are completely drained and the work of sinking is started on the 1200 level. The officials of the company authorize the statement that there is no truth in the rumor to the effect that legal action has been taken in the matter of the purchase of the property by the Monarch Co. and its subsequent transfer by the latter to the Jerome Victor Extension Co. So far as can be learned, no legal step affecting title to the ground is contemplated as there is nothing upon which such an action could be based. With the unwatering of the shaft, therefore, it is probable the troubles of the management will be of the past.

Control of the Venture Apex property adjoining the Venture Hill Co. in the Jerome copper belt, will within a few days be vested in H. E. Schumate and other mining men of Prescott and Jerome. The first payment was made about 10 days ago and will be followed shortly by payment in full and a change in control as stated. The deal covers 85 acres. Development work in a tunnel 600 ft. long has exposed copper ore of commercial value and apparently in place. On the dump there are about 150 tons of ore that samples well.

Another tunnel has a length of 300 ft., but is not yet in the ore. A number of shafts from 25 to 50 ft. deep have also been sunk at various points.

The shaft on the property of the Jerome-Portland Co. is down better than 75 ft. in a schist formation that shows strong copper indications. A compressor, and other mine machinery have been installed, and the necessary camp buildings are being erected. The working force numbers 15 men.

Montana capital, represented by George D. Case, formerly of the Anaconda Copper Co.'s smelter, is back of a plan to finance and develop a group of claims south of Jerome. Several prominent mining men of the Jerome field are likewise interested in the project, among them being C. V. Hopkins, chief engineer of the United Verde Copper Co., and George Mitchell, former superintendent of the United Verde Copper Co.'s smelter.

Miami.

Inspiration Needles Copper Co., owning 35 claims, 500 acres is acquiring Miami Needles group of 11 adjoining claims. This will give Inspiration Needles 720 acres, a compact tract lying one-half mile west of Inspiration Con. Nearly 500 acres of the Pinal schist ore-bearing porphyry formation of the Miami Copper belt underlie the Inspiration Needles tract. This is traversed throughout its extent by the contact between the Pinal schist and the overlying Schultze intrusive granite. This contact zone produces the ore bodies in the Miami district. John S. Cook, Globe, is financing the development by churn drilling. Two drills are down about 400 ft., showing patches of oxidized copper. Two more drills are contracted for and should arrive the last week in August. Ultimately 7 drills will be in operation. Sulphide ore is expected at about 600 ft., judging from its occurrence in the tunnel on the Standard No. 5 claim.

Wenden.

The mines near Wenden are attracting capital and many new companies have been formed and are now doing development work. The "Critic" mine is shipping one car per week of copper-gold ore that yields \$3000 per car net. The Desert mine is now equipped with gasoline hoist and air and Black Reef mine is installing a plant of a like nature. Both of these properties will be producers as soon as the necessary improvements can be made.

Crown King.

Eastern capital has taken over the leasehold on the Tiger Gold property in the Crown King country, hitherto held by C. C. Cowan and R. W. Runnels. The latter returned here a few days ago from the East where negotiations for the transfer were consummated and plans for the future development of the property were made. Under the new regime the main-working shaft is immediately to be unwatered and development of the ore bodies taken up. In former years the Tiger Gold produced a large tonnage of high grade gold ore. As the shaft was deepened values fell off somewhat and base minerals made their appearance. The milling appliances then in use proved inadequate to handle the base ore and the mine was closed down. Modern methods of mining and milling make possible the profitable reclamation of the mineral contents of the refractory ore. A considerable tonnage of the latter is exposed on the various levels of the mine.

CALIFORNIA.

Copperopolis.

At a depth of 15 ft. an 8-ft. ledge of gold-copper ore has been encountered in the Napoleon mine. A new shaft is going down in ore and the vein is steadily widening. The old mill is being overhauled and will be placed in commission soon. It is likely a small flotation plant may be installed.

Woody.

The Weringer Mines Co. is constructing a flotation plant of 100 tons capacity at its copper mine here. It is planned to start production within 90 days. Developments have been in progress about 5 years and it is stated sufficient ore is

exposed to keep the plant in steady operation for 2 years. High-grade chalcocite has been exposed in the crosscut from the 200 level and the winze is going down on a strong body of 4% material. Shipments of rich sulphides are being made at the rate of a car load weekly.

Auburn.

The Pacific Dredging Co., a subsidiary of the Yukon Gold Co., has contracted for the thorough prospecting of gravel deposits along the north fork of the American river from Auburn to Colfax. Prospecting of the Grottlan ranch is proceeding with a large drilling outfit. Codfish canyon and Manhattan bars, both famous producers, will be given principal attention. Satisfactory results will be followed by the building of one or more dredges.

Oroville.

Natomas Con. has started re-dredging of the first land successfully worked by the dredging practice in California. On the tracts formerly worked by dredges, Couch No. 1, 2 and 3, the company has installed Feather River dredge No. 1, provided with the latest gold-saving appliances. The boat is expected to not only profitably work the old tailings, but to restore much of the land to a state of fertility. Successful culmination of the experiment will be followed by the placing of several boats in operation.

Daggett.

Arrangements have been made to convert the 200-ton mill of the Daggett Reduction Co. into a custom plant for treatment of ores from the Goldstone district. The mill will operate in the interests of lessees and is expected to stimulate developments in the new gold camp. Shipments of rich ore continue to be made from the leading mines and deeper work indicates some of the ore bodies will probably persist to considerable depth. A considerable percentage of the ore is free milling.

Jackson.

A general strike of miners along the Mother lode is threatened by labor leaders unless a further advance in the wage scale is granted. The operating companies state it will be impossible to meet the demands, as many are operating on small margins of profit, and another advance would mean actual losses. The scale ranges from \$2.75 to \$3.35, depending on the property and the class of labor. A few of the leading concerns recently adopted a scale of \$3 to \$3.25, and it is thought will not be affected by the trouble.

Construction of the new mill of the Argonaut Co. is nearing completion and the stamps will start crushing soon. The plant contains 60 heavy stamps and numerous departments calculated to lower costs and increase the gold recovery. The old mill has 40 stamps. From the final set of tables tailings will flow into an impounding pond, served by a dam 400 ft. long and 40 ft. high at the lowest point.

Additional rolls and concentrators are being added to the mill of the Bunker Hill Con., near Amador City. Recent developments have materially augmented supplies of visible ore, and the plant is operating at capacity. Dividends continue to be disbursed at the rate of \$5,000 per month.

Carrville.

The Pacific Dredging Co. has completed the hull of its massive dredge in Morrison gulch, and is installing the machinery. Within 60 days the dredge is scheduled to go into operation. A large acreage of excellent ground has been proven and the company is still prospecting broad areas along the Trinity river and its tributaries with Keystone drills.

Nevada City.

The bed and banks of the South Yuba river for a distance of 2000 ft. below the junction of Humbing creek and the river have been taken under bond by W. W. Kirkham, R. L. Plummer, and L. R. Kirkham of Nevada City, and leased to E. W. Kay and associates of San Francisco. It is planned to divert the river from its course and to shovel the gravel and sand into sluices for extraction of the gold.

Darwin.

The Darwin Development Co. is operating the Columbia Lane, Jim and Promotory mines with good results. On the 600 level of the Jim a 2-ft. ledge of \$125 ore has been cut, and rich ore has also been opened in the Promotory. From the latter a tramline is being constructed to the mill. The

mill practice is unique. After being finely crushed the ore is mixed with small quantities of oil and magnetite and rotated with a number of small steel balls. The minerals concentrate on the balls from which they are removed by friction on a screen. Tests show a recovery of 85 to 87%.

Big Pine.

The Bunker Hill mine, east of Big Pine, has been acquired by J. F. Fitting, the Nevada operator, and arrangements made for extensive work. Some good ore is blocked out and further satisfactory work will be followed by the building of a mill.

Sonora.

Unwatering of the Omega mine has progressed to a point beyond the 300 level and mining has been resumed at the 200 and 300-ft. points. As soon as the 600 level is cleared of water extensive drifting will start to seek the big ore body which formerly yielded well; 20 men are employed.

A bond has been taken by Boston capitalists on the Bell mine, near Tuttle town, and unwatering of the shaft will start as soon as equipment can be assembled. The mine has produced well and contains wide ledges of good-grade quartz. It is a typical Mother lode property. Operations will be in charge of Paul S. Bernard.

Mokelumne Hill.

Rich gravel has been uncovered in the lower channel of the Stockton Ridge mine and the gravel mill is running at capacity with good results. The mine has been developed by a 3000-ft. tunnel and comprehensive lateral workings, and is well equipped. George Chapman is superintendent.

Ubehebe.

The Lost Burro gold mine, 4 miles from Ubehebe, has been taken under option by the Montana-Tonopah Co. and is being examined by company engineers. The principal vein has an average width of 4 ft. and assays \$19 to \$21 in gold. Tests indicate 85% of the metal can be recovered by amalgamation. A good flow of water has been developed within 2 miles of the mine.

Folsom.

A new jig has been invented by Emory Oliver, L. D. Hopfield, F. W. Griffen and Edward Strous of the Natomas Con. Co., that has proven its ability to recover 90 to 97% of the fine gold formerly lost in gold dredging. All the Natomas boats will be equipped with the new device, which is expected to save the company thousands of dollars daily.

COLORADO.

Cripple Creek.

Supt. McDonald has temporarily suspended sinking at the main shaft of the Strong mine in Victor, where a depth of approximately 1500 ft. has been attained. He is now engaged in cutting out the station for 1400 level. The elevation at the collar of the Strong shaft is 9756 ft. so that the station will be located at an elevation of approximately 8256 ft. As compared with the Portland No. 2 shaft, the Strong mine is now the deeper. The Portland No. 2 is 10,244 ft. above sea level at the collar of the shafts at 1900 ft. deep, so that the bottom level station is located at an elevation of about 8344 ft. as compared to 8256 ft. for the Strong. If the depths are correct the Strong is 88 ft. deeper, but it is possible the laterals from the Strong may be carried out at the same approximate elevation for possible connection at a future date.

W. F. Kendrick, Denver, president and director of the Anona Mining Co., owning in all about 26 acres adjoining the Isabella Mining Co., and old Victor Co., on the eastern slope of Bull Cliff, has visited the property and arrangements are being completed for the resumption of work.

Progress is being made with the drive from the 1000 level of the Vindicator Con. Co.'s main shaft to a point directly under the main shaft of the Hondo Co. south from the Vindicator. This lateral will be approximately 900 ft. in length, when the objective point is attained. Of this distance about 450 ft. has been covered. The lateral is now well within the boundary lines of the Hondo Co.'s estate, and important developments are anticipated. The lateral has crosscut several

minor cross leads and is now entering a section where the northwestern extensions of the veins of the Golden Cycle system, known to traverse this territory should be encountered. Machine drills are used, and in addition there are two machines on development and exploitation work in the main workings of the Hondo shaft.

A 35-hp. electric hoist and a 6-drill electric compressor installed at the main shaft of the W. P. H. mine have been brought into commission. The power line is from the Arkansas Valley Railway Light & Power Co. The mine is owned by the United Gold Mines Co. and is operated under lease. With the hoisting plant in operation, ore already broken will be brought to surface and shipments will be shortly resumed.

Returns received from a recent shipment from the Queen Bess mine show the 16 tons screenings returned \$91.40 a ton, and 11 tons of coarse quartz brought \$61 a ton. The lessees are operating through the 750 level of the Mollie Kathleen shaft, and ore is hoisted by the Mollie plant. The shoot has been proven by drift for 60 ft., and while the values in the north heading have fallen the south heading is showing up richer. The lessees have another shipment ready. The Queen Bess is owned by C. L. Tutt, Colorado Springs, and is operated by present lessees under lease and bond. The bond calls for the payment of \$17,500 during the life of the lease and it is expected that the lessees will lift the bond and own the property before the lease expires.

Leadville.

Four new furnaces have been brought in by the Western Zinc Oxide Co. The addition gives the plant 12 furnaces with a capacity of 5 tons or a total capacity of 60 tons a day. A wood fire is now burning in the new furnaces heating them preparatory to charging for continuous service. The plant has been operating continuously for several months, opening a market for the low-grade zinc carbonates that have been practically worthless. From this carbonate a high-grade zinc oxide is manufactured, a product that has a permanent demand. The manufacture of zinc oxide has been successful and it is planned to increase the capacity as soon as possible. The addition of a roasting plant for the treatment of sulphide ores is contemplated and undoubtedly will be undertaken during the present year. Some months ago, difficulty in securing enough ore for the operation of the plant was experienced. This shortage has now been overcome and large reserve stocks are being crushed and piled. It is stated that the reason for the change in conditions is due to the drop in the spelter market during the past few months. When spelter was high, low-grade carbonate of zinc found a profitable market in the large zinc smelting concerns. Ore from 12 to 20% is being shipped to the company, instead of to Oklahoma, Kansas and other centers. The following mines are the principal shippers: Tip Top, Baby, La Plata, Robert E. Lee, Little Silver and the Yak tunnel, with occasional shipments from other properties. The finished product is being shipped to an eastern market at the rate of 50 tons a week. This oxide is stated to be between 75 and 80% zinc. The output will be increased 25 tons a week as soon as the new block of furnaces are operating permanently.

IDAHO.

Wallace.

Reports emanating from reliable sources state that the O. W. R. & N. Co. has decided to build a branch line up Beaver creek in the Coeur d'Alenes, connecting with the Murray branch near the Idora spur, and that the construction contract already has been let. Spokane officials profess to be in ignorance of any contemplated extensions to the system in that region, but last week executive and traffic officers of the corporation, together with Harry L. Day and Eugene R. Day and representatives of the construction firm said to have secured the contract, made a trip of inspection over the proposed route, and it is said that members of the party announced that the line would be built as soon as possible. The survey has been established for some time, and a water grade from the connecting point on the Murray branch to the terminus has been secured. The line would

serve the Ray-Jefferson, Interstate-Callahan, Idora, Tuscombina and Virginia, all producing properties, and the Friend, Toughnut, Parrott, Sunset and several other properties that will be able to ship as soon as transportation is provided. A minimum monthly tonnage agreement is said to have been entered into with the companies that will benefit, the deficit, if any, to be subscribed pro rata. The proposed line would enable the Interstate-Callahan Co. to deliver its output through the Amazon-Manhattan workings to within about 3700 ft. of the tracks, while the shipping bins of the Ray-Jefferson can be located within a few feet of its main tunnel. It will bring transportation within a mile of the Idora mill, which treats the product of both the Idora and Tuscombina mines, and undoubtedly will result in greater development in the Beaver creek district than ever before. The Ray-Jefferson and the Interstate-Callahan will be the chief beneficiaries if the line is built. The former now has its 400-ton daily capacity concentrator almost ready to operate, and probably will be able to produce to the limit by the time the branch is in service, and the latter will be able to reduce transportation costs materially. At present its output is transported to the Mullan branch of the Northern Pacific over a 10,000-ft. aerial tram, but if shipments are diverted to the Beaver creek line through the Amazon-Manhattan workings, now connected with the Interstate-Callahan under of the Rex, accompanied by Raymond Guyer, consulting engineer of the Rex mill and tramway which have been operated for several years past by the Tamarack & Custer Con. The tramway equipment, which had been transferred so as to connect the Tamarack-Custer workings with the mill, is being re-transferred to the Rex, and the Tamarack-Custer has closed down. Directors L. E. Whicher and Robert Sweeney, grounds, a carrier of not to exceed three-fourths of a mile will convey the product to the shipping bins.

The Rex Con. Mining Co. has terminated the lease on near, are completing a thorough inspection of the Rex property, and report tramway reconstruction and mill improvements proceeding satisfactorily, and the mine being put in readiness for early ore production.

The management of the Independent Mining Co., whose holdings adjoin those of the East Caledonia Co., on Silver creek, is installing a compressor plant and hoisting equipment, and sinking the main shaft will be resumed as soon as the electric power line from the East Caledonia station, about a half mile distant, is completed.

The Federal Mining & Smelting Co. will pay the regular quarterly dividend, \$1 a share, or \$120,000, on the preferred stock on Sept. 15. This will make the payments for the year \$360,000 and will increase the grand total to \$15,645,545, of which \$2,708,750 was paid on the common stock prior to 1909.

Kingston.

The Hypotheek Mining Co., which owns and is operating the Hypotheek mine and mill, shipped 4 cars of crude ore and 6 cars of concentrates in August, according to the official report of Manager Otto A. Olson. Total operating expenses for the period were \$7,000, and the net earnings are estimated at not less than \$35,000. The crude shipments averaged about 77% lead and 10 ozs. silver, or about \$80 a ton above freight and treatment charges, and the concentrates ran about 64% lead, \$5 in gold and 15 ozs. silver, netting about \$73. The mill now is treating about 175 tons of ore daily, producing approximately 15 tons of concentrates, and about 4 tons of crude ore daily is being sorted.

LAKE SUPERIOR.

COPPER.

Houghton.

The production of the Lake Copper mines for August was somewhat less than for July. There may be a slight loss in September as there is one less working day, but on the other hand there are likely to be some small gains from somewhat improved labor conditions.

There is a rumor in circulation that when the Adventure mill starts up Mass will secure the use of one of the Allis-

Chalmers stamps for the rock that it can mine in excess of that treated at its own mill, which has only one stamp. The two properties have the same superintendent, E. W. Walker. Another rumor is that the Isle Royale may, when the Michigan begins milling some time in the fall or winter, utilize a stamp there.

Tamarack gas fallen off somewhat in output of rock as it is hoisting at the rate of about 30,000 tons monthly as compared with that of a few weeks back of 37,000. Shaft No. 5 as No. 3, is working wholly on the Calumet conglomerate, while No. 2 is taking its rock from the Osceola amygdaloid, and is getting its tonnage from the 32nd to the 38th levels, inclusive, of about the average grade.

Copper Range Con. has secured from the St. Mary's Mineral Land Co. an option 6 miles of territory south of the Globe tract, which stretches from the Champion boundary 6000 ft. along the strike of the mineral-bearing formations. It will be explored by the diamond drill.

About 3500 ft. south of No. 1 shaft at the Champion—stretch of ground that averages the best of any amygdaloid in the district—an almost vertical fault was encountered beyond which the ground was broken and almost barren and resembled very closely that opened at the Globe 6 years ago.

Naumkeag is working on the Old Pewabic which is an east branch of the main Pewabic or Quincy lode, and has quite a promising occurrence of the metal.

Indiana has considerable copper of commercial values with some all the way for the 9 ft. that have been so far opened on the lode thought to be the Butler, by blasting into the outcrop. The vein has the regular amygdaloidal characteristics and gives indications of being quite wide.

New Arcadian will soon begin to sink the shaft which is now down 50 ft. to the lode discovered 265 ft. west of the exploratory shaft, 1800 ft. south of the first shaft, and which is supposed to be the old Arcadian lode, down 50 ft. further and then drift.

Michigan continues to disclose on the Butler lode at the 6th level a large amount of mass copper, though the west drifts are very much better than the east just at present. The western drift is running south 65° west and is in 180 ft. from the shaft; the eastern is in almost as far. The mining is very irregular. It will be some time before the exact nature of the bed is fully understood, but its future looks very promising. The main crosscut which passes through all the lodes of the Evergreen and Knowlton series has reached a length of 130 ft. from the shaft and will be steadily continued.

Baltic is finding that its West vein has a mineralization much more extensive than at first supposed, and it appears that it will be like the famous foot-wall disclosures at the Wolverine and South Kearsage. It has been cut into at all of the shafts and has been found to extend to the 20th level at No. 2, and is practically furnishing all the production at No. 5; and though like the foot wall at the South Kearsage, it is very lumpy, it seems now that with the rather slight amount of opening that has been made that it may be eventually regularly mined as the Baltic lode. It is only about 14 ft. wide on the average as compared with the Baltic which runs about 23 to 25 ft., and its rock is by no means as rich, but at the present time it is quite profitable at a very low cost. The deepening of the shafts is proceeding steadily, the method used being to sink No. 3 and to run drifts from it to Nos. 2 and 4, and then to raise, which effects quite a saving in cost; No. 2 has about finished holing up from the 28th level; No. 3 is below the 31st, and No. 4 is at the 29th. The new levels at No. 2 are good, and No. 3 is looking better.

Ahmeek will have its new shaft-rockhouse ready in about 3 months, but there will be very little loss of time in transferring from the old house to the new as the latter is built over the former.

Winona is shipping about 600 tons daily, and could ship much more but additional men are very hard to get. President Paine has returned to Boston and it is likely that the new leaching plant will be adopted for 100 tons a day capacity unless there should be a reduction of the market price of copper.

Michigan has about 180 ft. from the shaft on the exploratory crosscut entered for the distance of 7 ft. in an ex-

cellent grade of stamp rock of amygdaloid on the strike of the Ogimah, which it is thought to be. The crosscut that found this lode has met with a succession of cracks and fissures which have in almost every case carried copper, about a ton having been taken out in about a week. The lode will be entirely crossed and probably some drifting will be done. On the Butler in the eastern drift the copper still continues, and though there is what the miners call a "horse," a strip of barren trap, in the middle of the face of the drift there is 4 ft. of good stamp rock on one side of it and considerable on the other. The western drift which was turned to the footwall did not find any copper, so that now the copper above the present face will be followed.

Lake's purpose of immediately opening the old shaft on the Knowlton lode is most highly commended by those mining men here familiar with the old workings, many of whom thought this work should have been started when the continuation of the war for quite a long period seemed quite certain to take advantage of the high prices for the metal. Just after the formation of the present company in 1905 copper was taken out of the mine with but little work, that was sold for \$3800.

South Lake is getting good copper in the drift it is driving north for the purpose of making connection with Lake in order to secure necessary ventilation for the working of its South lodes, which are over 1400 ft. from the shaft. A good deal of mass is coming from the Butler lode. The drop-hammer for cleaning off the waste rock from the mass copper has arrived and is being set up, will soon be in operation, and the mass can soon go to the Quincy smelter.

Keweenaw is building a new rockhouse of wood, 25 ft. long by 24 ft. wide, which will be sufficiently large, as the mill is only a short distance from the mine and consequently no large storage bin will be required. It is thought now that the trestle for the connection with the Keweenaw Central, owned by this company, the rockhouse and the mill will be ready for forwarding the rock about Sept. 15. The mill, which belonged to the old Phoenix Co., has one Ball stamp, Hodge and Woodbury jigs, and Willey and Overstrom tables, and though not of the latest types this equipment should give a good recovery.

Houghton Copper is still getting good copper values at the bottom of the winze, the 12th level on the north drift. The drill will be shifted over to the south side of the shaft towards the Superior and better ground may be entered.

Cherokee is in at the depth of 65 ft., the same heavy copper that has been encountered all the way from the outcrop and with its two drills will make a greater rate of progress. The bottom is completely in the good ground.

Hancock is getting very good rock in all of its openings at the Quincy No. 7 shaft, where stoping is being carried on in the 66th, 68th, 69th, 70th and 71st levels and drifting in the 53d which is the 63d of the Quincy.

Michigan is getting, besides a fair quantity of amygdaloid, over 400 lbs. of mass copper daily, one piece weighing over 1000 lbs. The main crosscut has the length of 260 ft., and is disclosing a little copper occasionally when a crack is entered. The western drift is now in very good rock. The Ogimah lode is being cut into by drifts and the stamp rock is showing up on the average well.

Carp Lake continues to display the same high-grade copper in the upper mineralized belt, which is 6 ft. in width, and on which all the work now being carried on is being done. Drifting has been started in the first shaft opened at the bottom of the winze which is 35 ft. down from the outcrop and at the No. 9 shaft.

Osceola's production for August will be about 109,000 tons as compared with 105,000 for July and 111,000 for June.

Quincy is putting in a new 600-hp. boiler at the mills at Mason 6 miles south of the mine on Torch Lake in order to provide for the two conical tube mills.

IRON.

Ishpeming.

Contracts for a new shop at the Cliffs shafts, and also for repairs and alterations to the dry at the same property,

and the Lake mine have been awarded by the Cleveland-Cliffs Iron Co. to Louis Erickson & Son. The increased forces working at the mines have overtaxed the dry capacity for some time. The buildings will be of brick. Other building operations of the company include the construction of a new office at the Cliffs shafts and a new dry at the Holmes.

A new Sullivan first-motion hoist is being installed at Section 16 mines by the Oliver Iron Co. It has two 26-in. cylinders, and a 10-ft. drum, built to hold about 1500 ft. of hoisting cable. A steam head of 125 lbs. will be used. The machinery is nearly assembled, and the concrete foundation is being poured. The new hoist will be located much closer to the boiler house than the present one, and the engine house, the erection of which will soon be commenced will be of concrete construction. The company will build the structure itself, instead of letting a contract to outside parties. James Bryden is in charge of the installation. It is expected that the new hoist and engine house will be ready for operation about Nov. 1.

July iron ore shipments totaled 9,750,157 tons, which exceed June by 242,581. Ore shipments to Aug. 1 have broken all former records by more than 5,000,000 tons. The total carried was 29,365,724 tons. The former high record was made in 1913. Carriers now freely predict a season approximating 50,000,000 tons. The United States head of the lakes has shipped 20,376,405 tons up to Aug. 1, against 13,678,166 tons a year ago, or an increase of 6,698,239 tons.

The Oliver Co. is intending to educate its foreign employes. So far a definite program has not been adopted by the officials, but suggestions offered by M. H. Godfrey, general superintendent of the company for the Virginia district, who was made chairman of the committee to draw up plans, met with hearty approval and are recommended for adoption by the corporation. Godfrey suggests a card index plan for all of the employes of the corporation. The cards are to be in yellow, white and red. The yellow cards are to contain the names of those who have no papers, the red those who have taken out only their first papers and the white those who have taken out their final papers. The cards give the name and mine number of the employe, nationality, age and information as to whether he reads English and attends night school and if he has taken out naturalization papers. It will be the aim of the company to have every employe become a citizen and preference will be given those who take out their papers.

MISSOURI-KANSAS.

Joplin, Mo.

Due to the continued drouth of the past 3 months and to the high cost of supplies and labor, the close of this month sees one of the weakest markets this district has had for a number of years, with unsettled conditions generally. The biggest reduction in output of the year occurred in August, but despite this fact, there is a large tonnage of ore lying in the bins, due to the weakness of the ore market. At a meeting of the mine operators of the Joplin, Webb City and Miami districts, it was decided, however, that there would be no concerted shut-down of the mines of these districts, but many operators expressed their intention of shutting down—but there will be no united action.

The C. M. & H. Co. is installing a new 2-stage 6-in. pump at the old Glendale shaft on the Continental Zinc Co.'s tract in West Joplin. The water is being drained to permit the working of a new shaft a short distance to the east, which was put down by this company last winter. Good dirt is being taken out and the company desires to work it about 30 ft. deeper than is now permitted.

The A. W. C. Co. is taking advantage of the present enforced idleness and is installing a new compressor at No. 1 plant. It is a 900-ft. Laidlow machine and will be electrically driven.

The Franklin mine has been sold to Lown & Hastings, former owners of the O. F. & L. mine at Duenweg. The consideration is said to be around \$50,000. This mine has been

in the hands of J. A. McConnel of Joplin, as trustee in bankruptcy, since Aug. 3, and the sale was made through him. The new owners are experienced mine operators and will start operations immediately.

Work on the new shaft of Jonas Smith on the Continental Zinc Co.'s land, west of Joplin, is rapidly progressing. This shaft will be put down at least 160 ft.

Ten new shafts are being put down by small companies on the Lone Elm Mining Co.'s tract, which produces a very high-grade concentrate, making this land attractive to smaller operators.

The Log Cabin 40-acre tract just southwest of Galena has recently been leased by T. A. Hogg and several associates. Work of drilling the tract already has begun, and shafts will be sunk as soon as the land shows up sufficient ore-bearing dirt. Adjoining the Log Cabin tract is the Diplomat, West Virginia and Sapp mines, which are considered the best producers of the Galena district.

Miami, Okla.

The Defender Mining Co. is planning the erection of a concentrating plant on the Quapaw 80-acre tract, where a rich ore body has been proved by drilling. J. H. Wright of Joplin is president and general manager, A. J. Williford of St. Louis is vice-president, and J. L. Diffenderffer of Lebanon, Mo., is secretary and treasurer.

The Blue Mound Mining Co. has given the United Iron Works Co. of Joplin, a contract to erect a 300-ton concentrating plant on the former's land near Picher. The Blue Mound Co. has been operating eight drill rigs on its lease and rich clippings of usual high-grade Oklahoma ore have been brought out.

One of the largest mills in the district has recently started operations on the Netta tract owned by the Picher Lead Co., its capacity being 600 tons per 10-hour shift. At its other properties the Picher Co. is pushing developments. At the No. 7 shaft a big Gainesville pump is being installed, which is the largest in the Oklahoma section of the camp, with the exception of the Lennan pump at Commerce. At the No. 1 shaft new pumps are also being installed and draining will be done so dirt from this shaft can be utilized for the Crawfish mill, which since its starting is said to have averaged 2 tons of zinc ore per hour recovery.

The Amia Kenneth Co. is planning to sink a new shaft on the Saft-Hoffman lease north and east of Century, as a result of a good drill strike made recently. Pay dirt was encountered in the first hole at a depth of 105 ft., continuing to 160 ft., and in the second hole this same run was encountered and a heavier run beginning at 198 ft. and extending for 16 ft. Competent mining men declare this to be one of the richest strikes in this district.

MONTANA.

Butte.

East Butte began in January with a production of 1,060,000 lbs. and reported an output of 1,893,000 for July, showing an increase about 80%. Whether that rate of output will be continued or not remains to be seen but, with the splendid ore now coming from the lower levels, it is believed it will be and perhaps increased. Some of the smelter output is coming from custom ores, but the East Butte itself is doing exceptionally well. Many think the company will resume dividends this year.

Work is being rushed in the Great Butte property, and the management expects to have the plant in readiness to begin unwatering the Butte-Bacorn claims within 2 weeks. Much of the machinery for the surface plant is on the ground and completion of the plant only awaits the finishing of the concrete and brick work. The boilers are in place, the grading has been completed, concrete forms for the engine and compressor are finished and the compressor, pumps, pipes and auxiliary apparatus are on the ground. The construction of the 70-ft. head frame has also been completed and the collar of the shaft is cribbed and ready for the work of unwatering to start. It is stated that the Bacorn shaft, which

has a depth of 1000 ft., will be unwatered within 2 weeks, it is expected, after the pumps are started.

Virginia City.

More than 22,000 cu. yds. of gold-bearing gravel are washed daily by the four dredges of the Conrey Placer Mining Co. in Alder gulch and the Ruby valley, according to Charles Kammerer, general manager. The year ending this month has been the greatest for output in the history of dredging. The ground of Alder gulch is being worked for the third time in sections. The gulch was drifted by the first gold seekers of the early '60s. Then the same territory was ground-slucied in the '70s, and now the dredges are washing the soil and gravel for the third time. The diggings made famous in Montana history are still rich in gold. The company operates the largest dredge in the world. The machine handles 11,000 cu. yds. a day, or as much as the combined yardage of the other three dredges at work. The machine is called dredge No. 4, and is manned by 10 men, three on each shift and an extra man during the day shift. The dredges are kept running every hour of the year save when shut down for repairs. There are 85 men now on the payroll.

Bannock.

Bannock Gold Mining Co. will be ready to start in operation its 200-ton cyanide plant by Sept. 15. The equipment consists of a crusher, an Allis-Chalmers ball tube mill and facilities essential to an all-slime, continuous counter-current decantation system of cyanidation. The ore consists of white quartz, carrying gold and silver, and occurs in a contact vein, between limestone and svenyte. The vein was opened by a main 700-ft. crosscut, starting 90 ft. above the creek level and running to the contact. Three other openings were made in a similar manner at higher points. A winze was sunk 165 ft. on the vein, from the main level, at which depth water level was reached. Tests showed the grade of ore to average \$11.65, and mill tests indicated that a recovery of 94.7% of the gold could be made and 68% of the silver. The same tests showed a cyanide consumption of 0.6 lb., and a mechanical loss of 0.5 lb. It is estimated that 200,000 tons of ore are exposed in the mine. The company has its own plant for hydro-electric power. The property is 26 miles from Dillon, and 11 miles from Grant, the latter on the Pittsburgh & Gilmore railroad. The officers of the company are: President, John F. Cowan, Salt Lake; vice-president, B. Binnard; secretary and treasurer, Dr. W. C. Ebaugh, Salt Lake; managing director, G. T. Hansen, Salt Lake, manager for Allis-Chalmers Co.; W. S. McCornick, Salt Lake, director.

Coloma.

P. M. McCree, consulting engineer of the Montana Gold Mines, who is now at the mine on a visit of inspection, states that 1000 ft. of the main tunnel had been completed. Two shifts are now employed, making progress at the rate of about 35 ft. per week. The rock passed through is of good character for the tunnel, as timbering was found necessary for only short distances in one or two places. No evidences have yet been seen of No. 1 vein. This is altogether favorable, and it is hoped that it will not be struck for a further considerable distance, for the reason that the further the tunnel goes before cutting this vein, the more chance there is to find that veins Nos. 1, 2, 3 and 4 will either "bunch up" or strike the Contact vein above the tunnel level, in which case valuable deposits are expected to be found at that point.

McCree states that the work is running smoothly and the new Jackhamers are working splendidly. Additional ones are being secured with which it is hoped to make even more rapid progress.

Troy.

Regardless of the fact that a scarcity of laborers has retarded construction of the improvements being installed at the properties of the Snowstorm Mines Con., the work is progressing fairly satisfactorily, according to Leo Greenough, president and general manager. "Despite delays we have been able to maintain a force that is carrying the betterments to completion within the time that we estimated would be required to complete construction," said Mr. Greenough. "Our standard gage railway line from Troy to the millsite is completed and operating, and material and machinery for the different plants are being delivered in advance of the con-

tract date. The hydro-electric station is well under way, and the transmission line is being built. The poles now are being set, and we will have everything in readiness to turn on the current when it is required." The company practically is a reorganization of the old Snowstorm Mining Co., which operated the Snowstorm mine, near Mullan, Ida., for a number of years and paid \$1,169,610 in dividends. The officers and principal stockholders are the same as in the defunct corporation, and it recently took over the assets of the Snowstorm, together with the Banner & Bangle group of lead-silver-zinc claims and adjoining properties near Troy. The new holdings are extensively developed with a series of tunnels, opening the mine to a vertical depth of 1200 ft., and recent reports state that there is sufficient ore in reserve to keep the mill now being built supplied for several years. About \$500,000 are being expended in constructing the mill, compressor plant, hydro-electric station and the railway. The millsite is about 2 miles from Troy and the mines about 6. The railway will be extended from the mill to the mine workings, and the entire system probably will be ready to operate soon after the first of the year.

NEVADA.

Tonopah.

Sinking of the Victor shaft of the Tonopah Extension to a depth of 1840 ft. is about to start. From the bottom level a crosscut will be driven to intersect the Murray vein. Preparations for stoping on the Murray vein from the 1540 level have been made and a heavy tonnage of excellent ore will soon be drawn from this point. The Afterall crosscut is being extended to develop the ore body, which is the most northerly vein yet opened in the district. It is reported the capacity of the mill is to be increased at least 10%. The plant at present is crushing 2200 tons per week.

Goldfield.

The ore body recently encountered at a depth of 875 ft. in the Silver Pick is about 3 ft. wide and assays \$30 to \$80. A heavy flow of water drove the miners out before much work could be done. The company is installing powerful pumps. The vein was struck east of the Columbia Mountain fault and is considered one of the most important developments in the district since early discoveries. It has been definitely decided to send the shaft to a depth of 1200 ft. and prospect both the shale-latite and shale-alaskite contacts.

The big flotation mill of the Goldfield Con. is now treating 1000 tons of ore daily and handling some ore of excellent grade from the newly-opened lower workings. It is reported the company is arranging to send 600 tons of tailings from the old dumps through the cyanide plant daily, and this product is figured to return a net profit of \$1 to \$2 per ton. Mine developments are stated to be pleasing. Rich ore has been uncovered in new ground in the Mohawk mine and conditions in the Red Top-Laguna territory are decidedly good. At the company's Aurora Con. mine 500 to 600 tons are going through the mill daily, and profits are said to be higher than at any time since work started. About 250 men are on the payroll.

Ore indications in the Lone Star continue to improve and the management is expectant of opening the main vein in the early future. Work is centered on the 225 level, where a huge dike is being explored. Above this point some bonanza quartz was extracted in early days.

Manhattan.

The discovery of rich ore at a depth of 310 ft. in the White Caps mine has stirred great interest and is considered the most important ore disclosure since the discovery of the camp. In the east drift from this level the vein is 12 ft. wide and averages \$30. In the west drift the ore shoot has a width of 40 ins. and assays up to \$125. The veins are apparently trending toward a junction and sinking will be resumed to open the ore further down. It is stated the ore can be readily worked by the new process the White

Caps Co. has developed. Part of the treatment will consist of roasting and subsequent treatment with cyanide.

Virginia City.

It is persistently rumored that the leading operating companies of the camp are seriously contemplating joining their resources to form a strong pumping association preliminary to unwatering of the deeper levels of the Comstock lode. It is said unwatering will be conducted to a depth of 3300 ft. and valuable ore bodies at this point opened for extraction. The output of the Union Con. has increased to \$10,000 per week, and on the 2400 level a strong shoot averaging \$19 has been opened.

Jarbidge.

Fully 200 men are now on the payrolls of Jarbidge companies and a large amount of new work is proceeding at all the main properties. New discoveries have been made north of Gorge gulch and about 1000 ft. east of the river and prospecting in this section is very active. Several million are in commission and the bullion output is steadily increasing.

NEW MEXICO.

Mogollon.

Socorro Mining & Milling Co. shipped twenty-one 100-lb. bars gold and silver bullion from operations covering first half of August and several tons of concentrate. New headframe for wire-rope tramway from Pacific mine is nearing completion. It is 60 ft. in height to carry cable directly over mill. The company paid a 1% dividend on Aug. 1, the fourth of like amount in 1916.

New working shaft of Mogollon Mines Co. has reached a depth of 860 ft. No stations will be cut until 900 level is reached.

The limited amount of exploration on the Clifton mine since May, when it was taken over by the Oaks Co. under bond and lease, disclosed a grade of ore almost from the beginning that is being packed regularly to custom works by burro. This mine adjoins the Eberle, both on the Queen vein, the two occupying the geographical center of the district, and their position will have an important bearing on a general consolidation of interests in the camp towards which the controlling factors are gradually working.

S. J. Kidder, manager Mogollon Mines Co., has tried out crushed vein rock on roads around property the past few months and this stood up well during rainy season, forming a smooth, hard surface. This plan for road covering will undoubtedly be used on new roads coming into camp both from Clifton, and Magdalena, and henceforth in repairing grade over mountain into Mogollon.

OREGON.

Prairie City

The Farnish Co. of San Francisco is operating a chrome-iron property near here, and there is an estimated 60,000 tons ready for shipment. It will be worked as an open pit, and a road is now being built from the property to this city. This body of ore lies at the head of Quartz gulch. It is on the south side of the mountain and on the south side of the contact which carries gold value. The property is owned by Joe Beggs and C. McCorkle and is being leased on a royalty basis to the Farnish Co.

SOUTH DAKOTA.

Hill City.

The old Harney Peak Co.'s tin mill is being remodeled by St. Louis capital, for concentration of tungsten ores. The motive power will be electricity, generated at the company's plant by steam boilers, using oil fuel. The mill will be

equipped with individual motors. It is the intention to handle custom ores also. It was expected that the plant would be in operation by Aug. 1, but delays occurred, which has postponed the date.

Deadwood.

The Deadwood-Standard mine in the Ragged Top district, which has been shut down for several years, is again active. For 3 months past there has been considerable work done on the property in the way of development. A shoot of silicious ore has been uncovered, carrying better than commercial values for its entire width. The shoot is from 15 to 18 ft. high and of unknown width. The work which is now being done was undertaken by Prof. Dove of Lead. The mill, a dry-crushing cyaniding plant, has been started up and at the present time is treating about 100 tons per day. While the work in the mine has been going on for some time, the mill has been in operation but a few days, and a cleanup will soon be made. In a few days the mill will be running to capacity, which will be from 400 to 600 tons.

Custer City.

The Custer Peak Mining Co.'s property has been dewatered to the 250 level. Sinking below the 250 level will commence immediately and will continue to the 500. A No. 9 Cameron has been installed. Also a 5-drill Norwalk compressor and a new 100-hp. boiler, making the total boiler capacity 200 hp. The increase in the value of the copper bearing ore, which was noted between the 150 and the 250 levels, is expected to continue, which should produce an ore of good milling value at the 500 level.

Lead.

The Two Bit Gold & Tungsten Mining Co. has been formed to operate in the Two Bit district on four claims. The main development has been done in a tunnel, running from the east side of the creek, in an easterly direction. At 100 ft. from the mouth, a vertical tungsten-bearing vein was struck and it is on this that the present development is being conducted. The vein has varied in width from a few inches to 2 ft. and has shown an average value of 48% tungstic acid. One and one-half tons of this quality of ore have been taken out and the present appearance of the ledge indicates that it is a permanent formation. The tunnel is in 110 ft. It was originally driven to develop the gold-bearing rock, known to exist at that point, which assays as high as \$36 gold and 18 ozs. silver. The tungsten indications have been found to extend from the tunnel, driven on the Two Bit No. 2 claim through the "4884" and the Yellow Jacket.

TEXAS.

Toyah.

The West Texas Sulphur Co., composed of New Orleans men, is preparing to exploit on an extensive scale the large sulphur deposit in the Toyah district acquired some time ago, embracing 600 acres. Test holes show that the sulphur deposit extends from the surface outcroppings to a depth of about 75 ft. The product is high grade and can be easily mined, it is claimed. The Michigan Sulphur & Oil which owns a large sulphur deposit in Culberson county, in the same section, recently installed the first unit of a large sulphur reduction plant and it is now turning out and shipping considerable quantities of the product. A party of Mobile men, headed by F. H. Edington, recently visited this section and made an inspection of the different sulphur deposits with the view of becoming financially interested in the industry.

Cliffside.

Much significance is attached to the announcement that has been received here from Washington that the work of exploring this section for potash by the survey is soon to be resumed. The government began boring for potash near Cliffside more than a year ago. While no information was divulged as to the success or indications that were met with, it is said that the valuable mineral product was met with in more or less quantities. The appropriation for the purpose was exhausted and the hole was temporarily abandoned. It

is now authoritatively stated that boring will be immediately resumed. Explorations will also be made in other localities where signs of the existence of underground beds of potash are found. It is the expressed belief of experts that this part of the Panhandle of Texas contains potash in paying quantities. There are many brackishwater lakes in the South Plains country, lying immediately to the south of the Panhandle, and the territory adjacent to these mineralized reservoirs will be explored in the search for potash.

UTAH.

Eureka.

After being idle 3 years the Utah Con. has resumed operations under Supt. A. D. Moore. An air compressor has been installed to facilitate work on the raise from the tunnel and the force can now accomplish as much work in 1 week as formerly required a month. There is a good showing in the vein matter on which the development is being pushed and important developments are expected within a brief time.

At the Lehi Tintie a compressor and an electric engine of 2-drill capacity has just been installed. The Utah Light & Power Co. will furnish the current, extending its present connections about 4000 ft. A body of lead-silver ore that carries average values of between \$18 and \$20 has been opened in the lower tunnel and shipments will be made regularly.

It is believed that depth will bring in new and better ore reserves at the Eureka Lily and a campaign is being started with this idea in view. Supt. Holdaway says that for a long period the leading mine geologists have asserted that East Tintie contained a great base fissure zone and that this fissure would be found in or near the old Lily ground. He believes that the Eureka Lily fissure, upon which the development work is now being prosecuted, is the one that will reveal the real richness of the camp. That there might be no delay in the plan of the company to get down to the values, a hoist has been installed on the 500 level, a large station cut, ore bins built and a skip constructed. From this station the development will proceed down a timbered incline shaft that will follow the Eureka Lily as deep as may be necessary.

The Eagle & Blue Bell shaft General Manager Pett has decided to send down another 200 ft. until the water level is reached. In the other properties surrounding, where the water level has been reached, it was at a point which would be approximately 2000 ft. in the Eagle, or 185 ft. below where the station is being cut on the 1875 level. The shaft has gone through ore for 53 ft. and it is still showing strong in the sump 10 ft. below the 1875 level. Where the station is being cut the ore is scattered a little so that it was about the only place that was found where the station could be cut. It is the intention to start drifting and develop the ground as soon as the station is completed. The time is very opportune for this work as shipments from the property have been curtailed by the smelters.

American Fork.

The Miller Mining & Smelting Co. is planning to resume development, which has of late been operated only by leasers. Returns on the recent shipment of zinc gave values of 32.7%. The property has been worked at intervals since 1868. The mine has produced more than \$2,000,000 in this period. As yet no considerable depth has been attained, the ore being taken from workings none of which exceed 250 ft. The leasers who have been gophering around the old workings have, in addition to taking out the rich zinc ore, found small bodies of ore carrying as high as 3 ozs. gold and the fissures in the quartzite are carrying gold values that make development on a more comprehensive scale advisable.

It is expected that the Pacific mill will be ready for operation Nov. 1. The machinery, excepting one carload, is on the ground ready for installation, and this car is on the way. The plant will have a capacity of 65 tons daily. It is being so constructed that additional units may be added. On the Pacific dump there is sufficient ore to keep the mill going for a year

and the vein is said to have sufficient mill ore exposed to keep the plant going for 10 years longer. The ore from the Pacific is a sulphide and ideal for concentrating. Little power will be necessary for crushing. Tests made on the ore show that it will reduce down to four to one and produce concentrate values of between \$50 and \$60. This will mean a production of about 16 tons of concentrates daily. It will also make the extractions of the high-grade ore more convenient and less expensive. Supt. Ferlin expects to add materially to his mining force when the mill is completed. Ten teams are kept busy at present hauling the high-grade to the railroad. This ore is bringing the company from \$2500 to \$4500 per car. The ores are producing copper, silver and lead.

Park City.

In the last 2 months the Park City Mines Co. has been doing some work on its own account and the management expects to be shipping from the Easter vein on two levels within 4 or 5 weeks. From the American Flag mine since April 1, lessees on the old workings have mined ore to the value of \$9738.84. Supt. Forsman says he has 6 ins. of high-grade ore in a raise recently started from the 1000 level north. On the 700 level he is drifting north and south on the Easter vein from an east crosscut. Beddings will be intersected in both directions. These beddings will probably be productive of high-grade as they have been on other levels. A large part of the land embracing the north extension of the Easter fissure has not been prospected and several other known veins have been examined only enough to prove their mineral character. An extensive development campaign was started from the 1100 level, but the unusual flow of water caused the management to postpone deeper work until freezing.

WASHINGTON.

Spokane.

The sale of the Republic Con. Mines Co.'s holdings at Republic, to the Day interests, has been officially announced. The reported purchase price of the properties, including the Lone Pine, Pearl and Surprise mines, is \$143,000, of which \$93,000 were paid when the deal was closed. The holdings are gold producers, and were extensively developed by the former owners, the original company, the Republic Mines Corporation, having shipped a considerable tonnage of ore during the period the group was under control of J. L. Harper, who promoted the company, and his associates. The concern became heavily involved financially, and about 3 years ago George S. Bailey of Republic was appointed federal receiver. Later a sale of the assets was made to A. B. Willard, of Tekoa, Wash., and A. J. Laughon, Republic, stockholders and the principal creditors, for \$150,000. They then organized the Republic Con. Mines Co. to take over and operate the group under bond, and the first payment from the Days was devoted to liquidating the bond. The entrance into the Republic field of the Day interests is believed to presage resumption of activity in the camp, and more attention is being attracted to the district than at any time since the early days of its history. The ore is particularly desirable for fluxing purposes, and the proximity of the region to the Northport smelter undoubtedly means that production on an extensive scale will be inaugurated. This no doubt will result in stimulating development of other Republic properties and placing the camp in the position that its latent resources really justifies. Republic camp is one of the greatest low-grade gold regions in the west, and there also are deposits of high-grade ore. Lack of treatment and power facilities have been responsible for retarding development of the several promising properties, but it is believed that these obstacles to advancement eventually will be overcome, as the Days have the necessary capital to establish mills and provide power. Current can be obtained from the Bonnington Falls plant of the West Kootenay Power & Light Co., now owned by the Consolidated Mining & Smelting Co. of Canada, by building a transmission line about 30 miles long, and it is anticipated that this is a part of the Day plans.

At least two new Stevens county properties will be added to the shipping list of northern Washington mines in the

next 60 days, and several others now in the development stage probably will be producing before the first of the year. The Admiral Mining Co., operating the Admiral mine, near Valley, will ship a car in a few days, and about Oct. 1 will begin forwarding not less than 100 tons monthly, which it is estimated will net about \$25 a ton. A force of men now is employed at the property, chiefly on development work, but the crew will be doubled as soon as regular shipments begin.

The Hecla Mining Co., which owns and has been doing extensive development on the Hecla group of copper-silver claims, 3 miles from Chewelah, now has about 400 tons of ore on the dump and will begin shipping as soon as a 1½-mile wagon road from the main tunnel to the principal highway leading to Chewelah is completed. Commissioner John C. Argall of Spokane is president of the Hecla Co., and other local men are heavily interested in the corporation.

The Spokane Mining Men's club is organizing a 4-day excursion into the Nelson and Slocan districts of British Columbia, and the expedition probably will leave Spokane in a special Pullman train over the Spokane International railway Sept. 29, according to plans that have been outlined by Secretary Frank C. Bailey, and the return trip will be made the night of Oct. 2. The program provides for a joint meeting at Nelson of the Spokane and Nelson Mining Men's clubs, and it is hoped that a session of the Canadian Institute of Mining Engineers and the Columbia Section, American Institute of Mining Engineers, can be arranged at the same time, as many of the Spokane and British Columbia mining men are members of all four organizations. The special Spokane train will transport the excursionists to Kootenay landing, on Kootenay lake, where a special Canadian Pacific boat will be waiting to take them on to Nelson, and from the later point special boats and trains will convey the party to the different mines that are to be visited, including those in the Sheep Creek, Ainsworth, Kaslo and Slocan districts.

With the entrance into the shipping lists of the Deer Trail mine, in the Deer Trail district of Stevens county, which is forwarding consignments to the smelter at Trail, transporting the output in wagons to the Northern Pacific railway at Davenport, 22 miles distant, there now are 22 mines in Washington and Idaho that are contributing to the treatment tonnage of the Canadian Con. Co.'s plant. The shipments to date this year from these properties amount to 19,971 tons. Of these producers 11 are in Stevens county.

A small deposit of ore, running as high as 19.9% tungsten, according to assays by the Stowell Assay Co., was encountered recently in the Spokane Belle mine, near Valley, and the owner, E. H. Belden, now has a small force at work stripping the veins in an effort to discover more of the metal.

Recognizing the increasing importance of the Valley mining district, in Stevens county, where more properties now are under development than ever before, the Consolidated Mining & Smelting Co. of Canada has authorized a reduced treatment charge on ores of the region that go to its smelter at Trail, and the Great Northern Railway Co. also has announced a reduction in the freight rate to that point, both new schedules to become effective about Oct. 1. The reduction rate will be \$1.50 a ton on ore that runs between \$25 and \$50, and the freight will be \$2.45, making the combined freight and treatment charge \$3.95. If the ore values exceed \$50 a proportionate additional charge will be made for both freight and treatment.

WISCONSIN-ILLINOIS.

Montfort.

The O. P. David mine shipped last week to M. & H. Zinc Co., LaSalle, 3 cars high-grade. The building of a new separating plant at Linden is to benefit the O. P. David mine.

Highland.

The Hard Fibre Co., a new smelting project, is represented in the Wisconsin field for the first time, and has been active in this camp bidding on carbonate zinc ore. Several shipments by local producers have been made within the past 2 weeks. Three new power and concentrating plants are in operation in this district with good results. Shipments of

carbonate zinc ore from the mines of the New Jersey Zinc Co. continue in volume.

Linden.

Frank Saxe, of the Milwaukee-Saxe Development Co., is authority for the statement that the eastern capitalists now exercising option on the company's holdings will provide a new \$25,000 magnetic ore separating plant without delay. Shipments of zinc ore for week Sept. 2 showed improvement. There remains in bin however at latest reports nearly 2000 tons of zinc concentrates.

Miffin.

Shipments of zinc ore have been restricted for the past 30 days from the mines of this district and reserves carefully collated show 1800 tons of zinc concentrate being carried in bin.

The Peacock Mining Co. in prospecting, struck rich deposits under old workings. Two hundred tons of mill rock are handled daily on one shift. The Buck, Meyer & Brown Mining Co. is sinking a new shaft in ground recently explored with drills; 28 men are employed in the mine and the recovery is high-grade going above 57% zinc. The Grunow Mining Co. making an average recovery of 12 tons of concentrates daily assaying 30% zinc. The O. K. Mining Co., a new project, is moving mill feed to the concentrator, a part of the B. M. & B. equipment. The Biddick mine, owned by the B. M. & B., is making an average of 20 tons of 32% concentrates on single shift, and shipping to the Benton Roaster Co. at Benton, from 3 to 5 cars weekly. The Lucky Six Mining Co., operating with 35 men, is making 10 tons of 46% zinc ore daily on single shift. A crosscut has been completed to new deposits discovered with drills south of the oldest established works.

The M. & A. Mining Co., operating the Big Tom mine, is now equipped with a 200-ton concentrator. The mine has been dewatered and the ground is being opened up for a heavy as well as steady production.

Vinegar Hill Zinc Co. is rebuilding its mill on the Yewdall lease. A considerable stretch of ground has been thoroughly proven with drill. Two shafts are in operation and a new hoist house with hoisting machinery installed is ready for service on shaft No. 2. An aerial tram will connect both plants. The Peni mine, controlled by the Royal Mining Co., is operating on the Grunow lease. Drills are going for the Grunow Mining Co. on the Gundry farm. B. M. & B. is drilling on the original Squirrel lease. Peacock Mining Co. continues with drills on new land. The two Coker mines, the property of the New Jersey Zinc Co., are yielding heavily, shipments running as high as 10 cars weekly, the ore all going to the refineries of the company at Mineral Point. Coker No. 2 is operating the old Sunrise mine with success, making 25 tons of concentrates daily. The Vinegar Hill Co. has taken over the Senator mine.

Platteville.

Some gains in price were shown during the week on standard and premium grades from zinc ore refineries, the price holding at \$60, while seconds ranged down to \$53 on values as low as 50%. Better offerings on medium grades were effected as buying improved and more ore moved from the bins of independent operating companies. No shipments of lead ore were made. Pyrites moved more freely, but the reserve in the field at latest reports is in excess of 15,000 tons. Local shippers were represented with a light turn-in, much ore being carried along.

Cuba.

Receipts of raw ore at the National Separating Works continue at the rate of 1000 tons or better. Deliveries are made to Illinois Zinc Co. and Granby Con. The entire surface plant of the Utt-Thorne Mining Co. on the Lawrence mine, was destroyed by fire last week. The loss is placed at \$18,000. Plans for a new outfit are now solicited. Gritty-Six is ready with a new plant. Big Eight Mining Co. is figuring on the early construction of a complete surface outfit.

Benton.

The installation of a new table plant at the Champion mine at New Diggins by the Wisconsin Zinc Co. is a new innovation as far as this district is concerned, in that the new plant houses eight Wifley tables and operates as a separate unit. Heretofore attempts have been made to operate

with one or two tables with indifferent results. In this instance the plant is under supervision of an expert and is succeeding in making a profitable return. Further improvements will be by the installation of Whaley electric shovel. The Champion mine is now being supplied with one of these machines and others are contemplated by the Wis. Zinc Co.

Increased cost of wages with high costs of material mine managers hold is making present prices for ore less profitable than \$40 per ton for 60% ore some years ago. These same authorities declare it is a very difficult problem to reduce wages at this time. Machine men are paid \$3.25 to \$4; miners on the breast \$3; mill men \$25 weekly; muckers 16 cts. per ton; trimmers \$2.75; engineers \$20 to \$25 weekly; ground bosses \$25 weekly. Cartage is placed at 25 cts. per ton-mile. Even at these figures men of all classes are in universal demand.

Galena.

L. V. Rice, of the Fields Mining & Milling Co. of Chicago, operating the Thompson and Crawhall mines at Shullsburg and the Galena Refining Co. at Galena, is authority for the statement that the company is earnestly engaged in working out a new smelter process involving great reductions in the cost of spelter production, and that a small experimental plant is under consideration. C. C. Whittier, manager of the separating works at Galena, has been in conference with experts in St. Louis, returning recently after an extended trip, the main purpose of which is working out of plans looking to an early start in the carrying out of the project. That the company intends to entertain the proposition seriously is seen in the recent purchase of the Empire Separating Works at Platteville, which will be dismantled and removed to the company's mine sites, enabling it to make a larger output of high-grade ore necessary to provide a reasonable supply of spelter ore for the new plant. The location is yet in doubt.

WYOMING.

Holmes.

At the meeting, Aug. 23, arrangements were made to relieve Julius Thielman of his work at the Rambler mine and he has returned to his home in Wisconsin, where his private affairs now require his undivided attention. The actual technical work is now in charge of a competent and experienced mining engineer, who is giving his entire time to that work. The company has again opened up the high-grade ore and it looks very promising. The roads are now in good condition, the first car of concentrates has been shipped and regular shipments of both concentrates and high-grade ore will be made from now on. Dorchester Mapes will hereafter be in full charge of operations, as business manager and will spend most of his time at the mine.

CANADA.

BRITISH COLUMBIA.

Hudson Bay.

The Hudson Bay Zinc Co. is shipping 33% zinc ore to Mineral Point. The company is controlled by Butte & Superior and is managed by James L. Bruce of Butte, Mont.

Adamant.

The Utica Mines Co., which owns and is operating the Utica group, 6 miles from here, is shipping at the rate of 5 cars monthly, and this rate of production probably will be maintained indefinitely, according to Charles F. Caldwell, original promoter of the company and its general manager for several years. "Because of the lower price of silver prevailing earlier in the year, shipments made at that time netted us only about \$3000 a car, but returns from the first car shipped in August, the only one from which reports have been received, show that it ran \$5256. Mining is being confined chiefly to the stope on the west ledge of the property. The company, which has issued 1,600,000 shares of its capital stock, is in excellent financial condition. All outstanding indebtedness has been liquidated, and there is a substantial

balance to our credit in the banks." The operating profit of the company was \$14,796 in 1915, according to a recent report to stockholders by Manager Clyde B. White.

ONTARIO.

Cobalt.

The Jordan Veteran claim has been taken over by the Kennebec Silver Mines, Ltd., the last payments having been made. The values contrary to custom are here found in the Keewatin formation. Exploration and development work has been very successful. Two veins have been opened up showing native silver and a considerable quantity of high grade has been bagged. The company expects to ship 2 cars of ore before winter. The plant consists of a 5-drill compressor, steam driven, and a hoist. Power is furnished by two locomotive type boilers.

The crosscut on the 325 level at the Adanae is now under the shaft and raising will start to connect with the shaft at the 275 level. The raise from the 275 level to the 200 was completed only a short time ago. An additional 100 ft. of sinking will be done, giving a depth of 425 ft., and from that level all future exploratory work will be carried on. Some high-grade is being bagged from the west winze at present.

Diamond drilling has now been under way at the West Dome for about 6 months. A thorough system has been inaugurated starting near the shaft at the Big Dome line and working west. No. 1 hole was put down 834 ft. on an angle, to a vertical depth of 684 ft. At 513 ft. a 5-ft. ore body was encountered which assayed \$44. At 400 ft. 6 ft. was cut which assayed \$11.75. No. 2 hole which was put down under Edwards Lake showed nothing of value. It was bored to an angle depth of 1514 ft. No. 3 hole, one of the deepest in the camp, was put down 1814 ft. to a vertical depth of 1462 ft. This showed only low grade, of which 28 ft. was encountered in the entire depth. It ran from \$1.80 to \$4.40. No. 4, which was started at a distance of 2100 ft. west of the present working shaft, proves that values continue right across the southerly portion of the property. Sixteen hundred ft. were drilled to a vertical depth of 1150 ft. At 150 ft. a 5-ft. ore body was cut which assayed \$13.80, and at 1100 ft. there are 3 ft., giving \$14.80. At 1485 ft. there is 5 ft. of \$8 ore. This hole shows 52 ft. of ore with an average value of \$6.71. No. 5 is located 1200 ft. west of No. 1 shaft and shows the best results. At a depth of between 300 and 400 ft. a 10-ft. body was cut which averaged about \$20. The hole was put down 1570 ft., with a vertical depth of 1100 ft., and the entire core showed 64 ft. of ore averaging \$5.90 per ton. The location of the new 4-compartment working shaft will be about 1400 ft. west of the present shaft, or about the center of the property, to facilitate economic production on a large scale when plans for the mill are fully decided on. This shaft will be 12 by 12 ft. and a start will be made on it shortly. Since diamond drilling was commenced 20 veins have been encountered.

Porcupine.

On surface the vein at the Davidson has been proven for 1000 ft. and is 40 to 50 ft. wide. Channel assays taken at regular intervals for 500 ft. over a width of 10 ft. averaged \$21. The main shaft is down 246 ft. with working stations at the 100 and 200 levels. Drifting operations to the west on the 100 level are now in the vein for 70 ft. and for the last 50 ft. over its entire width values averaged \$21.60, while for 16 ft. in width the values run \$12 per ton. The west face of the drift shows the highest values. On the 200 level a crosscut is driven in ore for 35 ft. across a body. Sampling of this body is now being made and average values will run \$12 to \$15. The main shaft is being sunk to the 300 level, at which point extensive lateral work will be started. With the tapping of the main vein on this level it is expected it will provide a 2-year supply for a 100-ton mill. The present management states there must be at least 2 years proven ore blocked before the building of a mill is begun. The most important lateral development in progress is on the 200 level where a crosscut is being sent southeast to tap a shear zone which is regarded promising. A number of high-grade stringers are now showing in the breast of the workings, some of which while narrow, contain specimen ore and would run \$2000.

World's Index of Current Literature

A Weekly Classified Index to Current Periodical and other Literature, Appearing the World Over Relative to Mining, Mining Engineering, Metallurgy and Related Industries, in Four Parts.

Part 1. *Geology*—(a) Geology; (b) Ore Genesis; (c) Mineralogy.

Part 2. *Ores and Metals*—(a) Metals and Metal Ores; (b) Non-Metals.

Part 3. *Technology*—(a) Mines and Mining; (b) Mill and Milling; (c) Chemistry and Assaying; (d) Metallurgy; (e) Power and Machinery.

Part 4. *General Miscellany* (including Testing, Metallurgy, Waste, Law, Legislation, Taxation, Conservation, Government Ownership, History, Mining Schools and Societies, Financial, etc.

Articles mentioned will be supplied to subscribers of Mining and Engineering World and others at the prices quoted. Two-cent stamps will be received for amounts under

\$1. Subscribers will be allowed a discount of 5 cts. if the price of the article exceeds 50 cts. The entries show:

(1) The author of the article.

(2) A dash if the name is not apparent.

(3) The title, in italics, of the article or book. Titles in foreign languages are ordinarily followed by a translation or explanation in English.

(4) When the original title is insufficient a brief amplification is added. This addition is in brackets.

(5) The journal in which the article appeared; also the date of issue, and the page on which the article begins.

(6) Number of pages. Illustrated articles are indicated by an asterisk (*).

(7) The price.

Silver

Higgins, W. C.—*Operations at the South Hecla Mine at Alta, Utah*.—*S. L. Mg. Rev.* Aug. 15 1916; p 15; pp 2¼*; 25c.

Saint-Smith, Cecil E.—*The Tinto Copper Syndicate's Mine, Montalban Irvinebank District, Australia*. [A complete de-

scription of the mine workings].—*Queen. Gov't Mg. Jnl.* July 15 1916; p 316; pp 2¾*; 35c.

Scott, W. A.—*Concentrating Mill Tailings near Park City, Utah*. [Concentration and haulage are dealt with. To get rid of zinc considerable of the lead and silver was lost formerly].—*Mg. World* Aug. 26 1916; p 359; pp 2½*; 10c.

Silver Milling, Metallurgy, Etc.

See Mill and Milling, Metallurgy, Chemistry, Assaying, Etc.

Zinc

Higgins, W. C.—*Operations at the South Hecla Mine at Alta, Utah*.—*S. L. Mg. Rev.* Aug. 15 1916; p 15; pp 2¼*; 25c.

Scott, W. A.—*Concentrating Mill Tailings near Park City, Utah*. [Concentration and haulage are dealt with. To get rid of zinc considerable of the lead and silver was lost formerly].—*Mg. World* Aug. 26 1916; p 359; pp 2½*; 10c.

Sieenthal, C. E.—*Production of Primary Spelter First Half of 1916*. [Abst. from U. S. G. S. semi-annual report].—*Mg. World* Aug. 26 1916; p 370; pp 1¼; 10c.

(II) NON-METALS

(A) FUELS

Coal Fields and Mining

Blakeley, A. G.—*Chemistry in Coal Mining*. [Some details and speaks of lines along which the coal mine chemist could work].—*Coal Age* Aug. 19 1916; p 296; pp 6½; 20c.

Cooper, S. G.—*The Production and Use of Power and Its Relation to Fuel Economy*.—*I. & C. Tr. Rev.* Aug. 4 1916; p 125; pp 1; 35c.

Hopwood, William.—*Mining and Dealing with Mine Water in the Mold Coalfield, England*. [A paper read before the National Assn. of Eng., England].—*I. & C. Tr. Rev.* Aug. 4 1916; p 127; pp 1¼*; 35c.

Lloyd, John.—*Safety and Efficiency in Coal Mining*. [A general discussion of measures taken along this line].—*Coal Age* Aug. 26 1916; p 332; pp 3*; 20c.

Pope, George S.—*Methods of Sampling Delivered Coal*. [Methods of sampling used in the government purchase of coal].—*U. S. Bur. of Mines Bull.* 116; pp 64*; 25c.

Ting, V. K.—*The Coal Resources of China*. [A general review of the country as regards coal deposits].—*Far East. Rev.* June 1916; p 1; pp 4*; 35c.

Coal Dust, Fire Damp, Etc.

Hood, W. W.; Knox, G.; Evans, E. C.—*South Wales Coal Dust Experiments*. [A paper read before the South Wales Colliery Officials' Assn.].—*Coll'y Guard.* Aug. 11 1916; p 256; pp 1¼*; 35c.

Pellegrino, John.—*Quenching a Mine Fire in a Kansas Mine with Chemicals*.—*Coal Age* Aug. 26 1916; p 303; pp 1¼*; 20c.

Coal and Coke By-Products

Childs, W. H.—*The Disposition of By-Product Oven Derivatives*. [A paper read before the American Iron and Steel Inst. A complete flow sheet is shown].—*Coal Age* Aug. 26 1916; p 311; pp 2*; 20c.

Clarke, Thomas C.—*The By-Product Oven an Adjunct to Preparedness*. [A paper read before the Soc. of Chem. Ind.].—*Coal Age* Aug. 26 1916; p 312; pp 1¼; 20c.

Lishman, G. P.—*Recent Improvements in By-Product Coke Oven Practice*.—*Jnl. Soc. of Chem. Ind.* July 31 1916; p 767; pp 3*; 50c.

Petroleum

Lee, Wallace.—*Geology of the Kentucky Part of the Shawneetown Quadrangle*. [The economic deposits are composed of coal, oil, lead, zinc and clay].—*Kentucky Geol. Surv.*; pp 73.

—*New Under-Reamer Efficient*. [A device for use in oil-well drilling].—*Oil Age* Aug. 1916; p 9; pp 1½*; 35c.

Fuels Miscellaneous

Peabody, Ernest H.—*Oil Fuel*. [On the use of forced draft and blowers in using oil fuel for generating steam].—*Pract. Eng.* Sept. 1 1916; p 737; pp 2¼*; 20c.

Pope, George S.—*Methods of Sampling Delivered Coal*. [Methods of sampling used in the government purchase of coal].—*U. S. Bur. of Mines Bull.* 116; pp 64*; 25c.

(B) STRUCTURALS AND CERAMICS

Cement

Pierce, Edwin G.—*The Determination of Sulphuric Anhydride in Portland Cement Analysis*. [Complete description of a method].—*Chem. Eng. & Mfg.* Aug. 1916; p 62; pp 1¼*; 30c.

—*Utilization of Shells in Manufacture of Portland Cement—Plant of Texas Portland Cement Co.*—*Chem. Eng. & Mfg.* Aug. 1916; p 60; pp 1¼*; 30c.

Concrete

Gould, Harry J.—*A Simple and Efficient Cost Keeping System for Concrete Construction*. [Both forms and descriptive information are given].—*Engg. & Cont.* Aug. 30 1916; p 199; pp 3; 20c.

Sherwin, R. A.—*Forms for Concrete Work*. [Abst. of a paper read before the American Concrete Inst. Details for construction and design of the same].—*Canadian Eng.* Aug. 17 1916; p 3¾; 35c.

—*Snake Creek Tunnel, Utah*. [A concrete tunnel. The construction and methods used in driving it are described].—*M. & S. P.* Aug. 5 1916; p 205; pp 2*; 20c.

Lime

Crow, W.—*Chemically Correct Hydrate of Lime on a Commercial Basis*. [Discusses the subject and has a supplement drawing of a section of the Schaffner continuous hydrator].—*National Lime Mfg. Assn. Bull.* 14; pp 8*.

Loughlin, G. F.—*Lime in 1915*. [On the uses, units of measurement and production].—*Min. Res. of U. S.* 11:19; pp 20.

III. TECHNOLOGY

MINES AND MINING

Surveying and Drafting

Boericke, W. F.—*Some Practical Notes on Mine Surveying*. [An alternative for shaft plumbing is given].—*E. & M. J.* Aug. 19 1916; p 333; pp 2½*; 25c.

Jackson, A. M.—*Azimuth*. [A paper read before the Assn. of Ontario Land Surveyors].—*Canadian Eng.* Aug. 24 1916; p 115; pp 2; 35c.

Marshall, R. B.—*Primary Traverse in Illinois, Wisconsin, Minnesota, North Dakota and South Dakota*. [Survey data on survey stations established].—*U. S. G. S. Bull.* 644-E; pp 72.

Sanner, F. C.—*Set-Over Tables for the Mine Transitman*.—Coal Age Aug. 26 1916; p 335; pp 1*; 20c.

Ore Reserves

Campbell, M. R.—*Half Century Life of Coal Supply*. [Abst. from a U. S. G. S. report].—Coal Tr. Bull. Aug. 15 1916; p 40; pp 2½; 25c.

Ting, V. K.—*The Coal Resources of China*. [A general review of the country as regards coal deposits].—Far East Rev. June 1916; p 1; pp 4*; 35c.

Drilling and Boring

Parsons, L. A.—*Diamond Drilling at Sudbury, Ontario*. [Details of operation and costs].—E. & M. J. Aug. 26 1916; p 381; pp 1¾; 25c.

Phelps, Charles C.—*Shanking Drill Steels*. [Explanatory drawings are shown].—E. & M. J. Aug. 26 1916; p 387; pp 3½*; 25c.

Weston, E. M.—*Governing the Use of Explosives in Mines*. [From "Practical Mining on the Rand." Treats on the use of explosives and correct method of placing holes].—Mg. World Aug. 26 1916; p 363; pp 2½*; 10c.

Canadian Mining Corporation. [Cost and other details of operation].—E. & M. J. Aug. 19 1916; p 348; pp 1¼; 25c.

New Under-Reamer Efficient. [A device for use in oil-well drilling].—Oil Age Aug. 1916; p 9; pp 1½*; 35c.

Explosives and Blasting

Taylor, Guy B.; Cope, W. C.—*Sensitivity to Detonation of Trinitrotoluene and Tetranitromethylanilin*. [Describes method and apparatus for making test with some results obtained].—U. S. Bur. of Mines Tech. Paper 145; pp 13; 15c.

Weston, E. M.—*Governing the Use of Explosives in Mines*. [From "Practical Mining on the Rand." Treats on the use of explosives and correct method of placing holes].—Mg. World Aug. 26 1916; p 363; pp 2½*; 10c.

Shafts and Shaft Sinking

Rose, Hugh.—*Mining Practice at Santa Gertrudis, Mexico*. [Abst. from the A. I. M. E. Bulletin. Contains drawings, details and general description].—E. & M. J. Aug. 26 1916; p 371; pp 6*; 25c.

The Mount Morgan Mine and Works, Australia. [Complete description of the geology, mining and concentrating plant of this mine, once a gold mine but now copper].—Mg. & Engg. Rev. July 5 1916; p 244; pp 9*; 35c.

Ventilation

Crankshaw, H. M.—*Mining and Ventilation Methods in Thick Pitching Beds*. [A paper to be read at the A. I. M. E. Arizona meeting].—Coal Tr. Bull. Aug. 15 1916; p 23; pp 5*; 25c.

Queensland Mines Inspection. [Labor, wages, accidents, ventilation, etc.].—Queen. Gov't Mg. Jnl. July 15 1916; p 329; pp 3; 35c.

Dredging

Alderson, Matt. W.—*Mineral Possibilities in Colombia, S. A.* [The author's experience in placer and vein operations for gold in that country].—Mg. World Aug. 26 1916; p 367; pp 2¼*; 10c.

Eddy, Lewis H.—*Yuba No. 15 All-Steel Gold Dredge*. [A general detailed description of the dredge and its operation].—E. & M. J. Aug. 19 1916; p 329; pp 2*; 25c.

Young, Ralph A.—*Testing of Dredge*

Bucket Pins. [On the use of carbon-steel instead of more expensive alloyed steels].—E. & M. J. Aug. 26 1916; p 377; pp 2¼*; 25c.

Haulage and Conveying

Green, R.—*Horse Haulage vs. Compressed Air Haulage at Collieries*. [In discussing the subject a comparison of actual costs is made].—Canadian Mg. Inst. Bull. Aug. 1916; p 711; pp 6; 35c.

Hellmund, R. E.—*Rating of Mine Locomotives*.—Coal Age Aug. 26 1916; p 337; pp 2; 20c.

Scott, W. A.—*Concentrating Mill Tailings Near Park City, Utah*. [Concentration and haulage are dealt with. To get rid of zinc considerable of the lead and silver was lost formerly].—Mg. World Aug. 26 1916; p 359; pp 2½*; 10c.

The Mount Morgan Mine and Works, Australia. [Complete description of the geology, mining and concentrating plant of this mine, once a gold mine but now copper].—Mg. & Engg. Rev. July 5 1916; p 244; pp 9*; 35c.

Accidents

Fay, Albert H.—*Coal Mine Fatalities in the United States, May, 1916*. [The nature, number and location of the accidents are given in tabulated form].—U. S. Bur. of Mines Monthly Statement; pp 28.

Pellegrino, John.—*Quenching a Mine Fire in a Kansas Mine with Chemicals*.—Coal Age Aug. 26 1916; p 303; pp 1¼*; 20c.

Queensland Mines Inspection. [Labor, wages, accidents, ventilation, etc.].—Queen. Gov't Mg. Jnl. July 15 1916; p 329; pp 3; 35c.

Safety

Lloyd, John.—*Safety and Efficiency in Coal Mining*. [A general discussion of measures taken along this line].—Coal Age Aug. 26 1916; p 332; pp 3*; 20c.

Rose, Hugh.—*Mining Practice at Santa Gertrudis, Mexico*. [Abst. from the A. I. M. E. Bulletin. Contains drawings, details and general description].—E. & M. J. Aug. 26 1916; p 371; pp 6*; 25c.

Sanitation

Edwards, J. W.—*Industrial Diseases of Iron and Steel Workers in Meddelsborough, England*. [A paper read before the British Medical Assn.].—I. & C. Tr. Rev. Aug. 11 1916; p 153; pp 1; 35c.

Labor and Management

Queensland Mines Inspection. [Labor, wages, accidents, ventilation, etc.].—Queen. Gov't Mg. Jnl. July 15 1916; p 329; pp 3; 35c.

Accounts and Bookkeeping

Huac, A. J.—*Cost Accounting for the Clay Plant*. [A series of articles, including forms, tables and description for a complete cost accounting system].—B. & C. Rec. Aug. 15 1916; p 307; pp 3; 35c.

Production

Ball, Lionel C.—*Mount Cannindah Copper Mine, Australia*. [The history by years, geology, concentrating and smelting methods are taken up in detail with production figures].—Queen. Gov't Mg. Jnl. 1916; p 318; pp 6*; 35c.

Dunstan, B.—*Queensland Mineral Deposits, Australia*. [Occurrence, production, values, prospects and properties by the chief Government Geologist].—Queen. Gov't Mg. Jnl. July 15 1916; p 314; pp 1¾; 35c.

Kotze, R. N.—*Far East Rand and Suggested Changes in the Gold Law*. [Abst.

from a South African government report taking up operations and production with respect to suggested law].—Mg. Mag. Aug. 1916; p 75; pp 9*; 50c.

Loughlin, G. F.—*Lime in 1915*. [On the uses, units of measurement and production].—Min. Res. of U. S. II:19; pp 20.

Phalen, W. C.—*Bauxite and Aluminum in 1915*. [On the production, uses and methods of refining].—Min. Res. of U. S. I:7; pp 16*.

Siebenthal, C. E.—*Production of Primary Spelter First Half of 1916*. [Abst. from U. S. G. S. semi-annual report].—Mg. World Aug. 26 1916; p 370; pp 1¾; 10c.

Mining Costs

Parsons, L. A.—*Diamond Drilling at Sudbury, Ontario*. [Details of operation and costs].—E. & M. J. Aug. 26 1916; p 381; pp 1¾; 25c.

Rose, Hugh.—*Mining Practice at Santa Gertrudis, Mexico*. [Abst. from the A. I. M. E. Bulletin. Contains drawings, details and general description].—E. & M. J. Aug. 26 1916; p 371; pp 6*; 25c.

Wilson, Philip D.—*Comparison of Stopping Methods at Calumet & Arizona Mine*. [Abst. from the bulletin of the A. I. M. E. Description of methods used and comparisons of costs and advantages].—M. & S. P. Aug. 26 1916; p 315; pp 3½*; 20c.

Consolidation of the Treadwell Mines, Alaska. [Operating costs, production, description of the company's holdings, etc., and items of financial interest are given].—M. & S. P. Aug. 26 1916; p 307; pp 7*; 20c.

Mining Miscellany

Weimbren, M.—*Method of Removing Broken Ore from Flat Stopes*. [Abst. from the Jnl. of the Chem. Met. & Mg. Soc. of South Africa].—Mg. World Aug. 26 1916; p 362; pp ¾*; 10c.

Wilson, Philip D.—*Comparison of Stopping Methods at Calumet & Arizona Mine*. [Abst. from the bulletin of the A. I. M. E. Description of methods used and comparison of costs and advantages].—M. & S. P. Aug. 26 1916; p 315; pp 3½*; 20c.

MILL AND MILLING

Sampling

Pope, George S.—*Methods of Sampling Delivered Coal*. [Methods of sampling used in the government purchase of coal].—U. S. Bur. of Mines Bull. 116; pp 64*; 25c.

Crushing, Grinding, Etc.

Labbe, Charles.—*Replacing Mortar Blocks in Stamp Mills*.—E. & M. J. Aug. 26 1916; p 391; pp 1¾*; 25c.

The Mount Morgan Mine and Works, Australia. [Complete description of the geology, mining and concentrating plant of this mine, once a gold mine but now copper].—Mg. & Engg. Rev. July 5 1916; p 244; pp 9*; 35c.

Flotation

A New Flotation Machine. [An account of the recent patent to Eberenz and Brown].—Mg. World Aug. 26 1916; p 365; pp ¾*; 10c.

Concentration: Sorting, Sizing, Washing

Ball, Lionel C.—*Mount Cannindah Copper Mine, Australia*. [The history by years, geology, concentrating and smelt-

ing methods are taken up in detail with production figures].—Queen. Gov't Mg. Jnl. July 15 1916; p 318; pp 6*; 35c.

Bradley, W. W.—*Concentration Methods for the Reduction of Quicksilver Ores*. [Work now being carried on by the California Mining Bureau].—Mg. World Aug. 26 1916; p 366; pp ¾; 10c.

Scott, W. A.—*Concentrating Mill Tailings Near Park City, Utah*. [Concentration and haulage are dealt with. To get rid of zinc considerable of the lead and silver was lost formerly].—Mg. World Aug. 26 1916; p 359; pp 2½*; 10c.

—*The Mount Morgan Mine and Works, Australia*. [Complete description of the geology, mining and concentrating plant of this mine, once a gold mine but now copper].—Mg. & Eng. Rev. July 5 1916; p 244; pp 9*; 35c.

Mill and Smelter Costs

—*Consolidation of the Treadwell Mines, Alaska*. [Operating costs, production, description of the company's holdings, etc., and items of financial interest are given].—M. & S. P. Aug. 26 1916; p 307; pp 7*; 20c.

CHEMISTRY AND ASSAYING

Chemistry

Blakeley, A. G.—*Chemistry in Coal Mining*. [Some details and speaks of lines along which the coal mine chemist could work].—Coal Age Aug. 19 1916; p 296; pp 6½; 20c.

Pierce, Edwin G.—*The Determination of Sulphuric Anhydrid in Portland Cement Analysis*. [Complete description of a method].—Chem. Eng. & Mfg. Aug. 1916; p 62; pp 1¾*; 30c.

Analysis

Pierce, Edwin G.—*The Determination of Sulphuric Anhydrid in Portland Cement Analysis*. [Complete description of a method].—Chem. Eng. & Mfg. Aug. 1916; p 62; pp 1¾*; 30c.

Electrochemistry

Buck, H. W.—*Comparisons Between Steam and Water Power*. [Discussion of the two forms of power and their application].—Mg. World Aug. 26 1916; p 373; pp 1½; 10c.

METALLURGY

Electrometallurgy

Phalen, W. C.—*Bauxite and Aluminum in 1915*. [On the production, uses and methods of refining].—Min. Res. of U. S. I:7; pp 16*.

Thermic Metallurgy

Ball, Lionel C.—*Mount Cannindah Copper Mine, Australia*. [The history by years, geology, concentrating and smelting methods are taken up in detail with production figures].—Queen. Gov't Mg. Jnl. July 15 1916; p 318; pp 6*; 35c.

Bradley, W. W.—*Concentration Methods for the Reduction of Quicksilver Ores*. [Work now being carried on by the California Mining Bureau].—Mg. World Aug. 26 1916; p 366; pp ¾; 10c.

Dunstan, B.—*Queenland Mineral Deposits, Australia*. [Occurrence, production, values, prospects and properties by the chief Government Geologist].—Queen. Gov't Mg. Jnl. July 15 1916; p 314; pp 1¾; 35c.

Tournay-Hinde, A. W.—*The Flow of Air in Lead Blast Furnaces*. [Abst. of a paper read before the Engg. Assn. of New South Wales].—E. & M. J. Aug. 26 1916; p 392; pp 1; 25c.

Hydro-Metallurgy

Phalen, W. C.—*Bauxite and Aluminum in 1915*. [On the production, uses and methods of refining].—Min. Res. of U. S. I:7; pp 16*.

POWER AND MACHINERY

Electricity

Copeland, Clem A.—*Properties of Iron and Steel Wires and Cables*. [Gives curves and tabulated data showing both physical and electrical properties].—Jnl. Elect., Power & Gas. Aug. 26 1916; p 157; pp 2¼*; 35c.

Hellmund, R. E.—*Rating of Mine Locomotives*.—Coal Age Aug. 26 1916; p 337; pp 2; 20c.

Rose, Hugh.—*Mining Practice at Santa Gertrudis, Mexico*. [Abst. from the A. I. M. E. Bulletin. Contains drawings, details and general description].—E. & M. J. Aug. 26 1915; p 371; pp 6*; 25c.

—*Construction of a Big Plant*. [General arrangement and some special construction features at the Public Service Electric Co.'s Plant, Essex, New Jersey].—Pract. Eng. Sept. 1 1916; p 727; pp 15*; 20c.

Compressed Air

—*Fullerton, Hodgart and Barclay Vertical Air Compressor*. [Sectional and plain views are shown].—I. & C. Tr. Rev. Aug. 4 1916; p 132; pp 2*; 35c.

Gas Producers, Producer Gas

—*Lynn-Rambush Gas-Producer*. [Drawings and illustrations showing its operation and construction].—Engg. Mag. 11 1916; p 127; pp 1*; 35c.

Combustion Engines

Clarke, Thomas C.—*The By-Product Oven an Adjunct to Preparedness*. [A paper read before the Soc. of Chem. Ind.].—Coal Age Aug. 26 1916; p 312; pp 1¾; 20c.

Steam and Steam Engines

Buck, H. W.—*Comparisons Between Steam and Water Power*. [Discussion of the two forms of power and their application].—Mg. World Aug. 26 1916; p 373; pp 1½; 10c.

Crawford, C. W.—*The Steam Engine's Extravagance*. [A general discussion on the use of different designs of steam engines].—Coal Age Aug. 26 1916; p 351; pp 1¾; 20c.

Peabody, Ernest H.—*Oil Fuel*. [On the use of forced draft and blowers in using oil fuel for generating steam].—Pract. Eng. Sept. 1 1916; p 737; pp 2¾*; 20c.

Schiefer, H. V.—*Handling Coal in Large Boiler Houses*.—Coal Age Aug. 26 1916; p 349; pp 2*; 20c.

—*Construction of a Big Plant*. General arrangement and some special construction features at the Public Service Electric Co.'s Plant, Essex, N. J.].—Pract. Eng. Sept. 1 1916; p 727; pp 15*; 20c.

—*Steven's Under-Feed Stoker*.—Pract. Eng. Sept. 1 1916; p 761; pp 1½*; 20c.

Miscellaneous Power and Machinery

Buck, H. W.—*Comparisons Between Steam and Water Power*. [Discussion of the two forms of power and their application].—Mg. World Aug. 26 1916; p 373; pp 1½; 10c.

Kent, Robert T.—*Power Transmission by Leather Belting*.—Wiley & Sons; book; pp 114*; \$1.25.

IV. MISCELLANEOUS

Miscellaneous Costs

Gould, Harry J.—*A Simple and Efficient Cost Keeping System for Concrete Construction*. [Both forms and descriptive information are given].—Engg. & Cont. Aug. 30 1916; p 199; pp 3; 20c.

—*Canadian Mining Corporation*. [Cost and other details of operation].—E. & M. J. Aug. 19 1916; p 348; pp 1¾; 25c.

Testing

Hood, W. W.; Knox, G.; Evans, E. C.—*South Wales Coal Dust Experiments*. [A paper read before the South Wales Colliery Officials' Assn.].—Coll'y Guard. Aug. 11 1916; p 256; pp 1¾*; 35c.

Young, Ralph A.—*Testing of Dredge Bucket Pins*. [On the use of carbon-steel instead of more expensive alloyed steels].—E. & M. J. Aug. 26 1916; p 377; pp 2¼*; 25c.

Metallography

Tschishewsky, N.; Herdt, A.—*Iron-Boron and Iron-Carbon Alloys*. [A paper from the Journal of the Russian Met. Soc. Gives the properties, method of preparation and equilibrium curve for the alloys].—Iron Age Aug. 24 1916; p 396; pp 2*; 30c.

Waste: Slag, Tailings, Fumes, Etc.

—*Basic Phosphate Fertilizer as a By-Product in Iron Smelting*. [A method used in connection with open-hearth smelting].—Chem. Eng. & Mfg. Aug. 1916; p 68; pp 1*; 30c.

Law, Legislation, Taxation

Kotze, R. N.—*For East Rand and Suggested Changes in the Gold Law*. [Abst. from a South African government report, taking up operations and production with respect to suggested law].—Mg. Mag. Aug. 1916; p 75; pp 9*; 50c.

Conservation

Cooper, S. G.—*The Production and Use of Power and Its Relation to Fuel Economy*.—I. & C. Tr. Rev. Aug. 4 1916; p 125; pp 1; 35c.

History

Ball, Lionel C.—*Mount Cannindah Copper Mine, Australia*. [The history by years, geology, concentrating and smelting methods are taken up in detail, with production figures].—Queen. Gov't Mg. Jnl. July 15 1916; p 318; pp 6*; 35c.

—*The Mount Morgan Mine and Works, Australia*. [Complete description of the geology, mining and concentrating plant of this mine, once a gold mine but now copper].—Mg. & Engg. Rev. July 5 1916; p 244; pp 9*; 35c.

Societies

—*North of England Institute of Mining and Mechanical Engineers*.—Coll'y Guard. Aug. 11 1916; p 254; pp 2*; 35c.

Financial

—*Consolidation of the Treadwell Mines, Alaska*. [Operating costs, production, description of the companies' holdings, etc., and items of financial interest are given].—M. & S. P. Aug. 26 1916; p 307; pp 7*; 20c.

—*Recent Developments in the Sudbury District, Ontario*.—Canadian Mg. Jnl. Aug. 15 1916; p 391; pp 1¾*; 35c.

Ore and Metal Markets; Prices-Current

New York, Sept. 7, 1916.

Silver.—Quotations for silver per fine ounce at New York and per standard ounce at London for the week ended Sept. 6 were as follows:

	New York, cents.	London, pence.
Aug. 31.....	67¼	22
Sept. 1.....	68¼	32¾
2.....	68½	32¾
4.....	68	32¾
5.....	68	32¾
6.....	68¼	32½

MONTHLY AVERAGE PRICES OF SILVER.

Month.	New York			London Standard Oz.	
	High.	Low.	Avg.	1915.	1916.
January	57½	55½	56.775	48.890	26.875
February	57	56½	56.755	48.477	27.000

December	55.038	26.232
Year	49.690	23.470

Difference in domestic and foreign prices explained by the fact that the New York quotations are per fine ounce; the London per standard ounce 8.925 fine.

Copper.—General demand since our last report has been active. Domestic and foreign users have been buying steadily. Orders for delivery in November and December and in the first quarter of next year have been frequent and large. Paucity of nearby metal—spot and October—is becoming more acute. Electrolytic for November is not in plentiful supply either, while some producers are sold out for December. Spot electrolytic in second hands has been sold at 28½ cts. in 50-ton lots, while for October delivery sales have been made at 28¼ cts. Some dealers quote 27½ cts. for spot, but consumers who endeavored to buy at this price found that only 5 to 10 lots were available or the copper was off-grade. Prices for first hands for November delivery hold at 28 cts., with December quoted at 27¾@28 cts. Some prime lake copper on the spot sold at 27¾ cts., but lake copper for the fourth quarter is held at 28 cts. Spot casting copper changed hands at 25½ cts., with some producers quoting 25 cts. for the fourth quarter.

Europe is taking copper at the rate of 70,000,000 lbs. a month. Taking our output at the outside estimate of 165,000,000 lbs. a month, it will be seen that with domestic absorption 80,000,000 lbs. a month, refiners have little metal to put aside to maintain safeguards against interruptions. Indications are that exports will increase in the closing months of the year. Shipments of 80,000,000 lbs. are anticipated, while some factors report that 90,000,000 lbs. may go out each in November and December. On this reckoning it is likely that additional refining capacity will come into play before long. Augmentation of refining capacity to 200,000,000 lbs. a month was contemplated.

One of the largest copper producers declares that each month of war will add a like period to the extensive reconstruction absorption of copper. He asserts that for fully 2 years after the turmoil in Europe has ceased demand for copper will continue at a rate that will compel production at the present record-breaking volume. This view is being noted in a continually enlarging circle. The fear of a reaction after peace is declared is not being expressed so openly as hitherto. The situation, therefore, is not one where possibility of over-production acts as a restraining barrier on the market.

The London market last week again showed standard copper to be erratic, while electrolytic advanced £1 to £130. Standard opened the week with an advance, but closed £1 lower in spot and £1 10s in futures from the high price. The copper statistics just received show that the total visible

supply on Aug. 31 increased 492 tons to 11,514 tons. Stocks of furnace material in England increased 1660 tons to 4839 tons, while stocks of fine copper in France increased 32 tons to 2675 tons. The afloat from Chile was 850 tons and from Australia 3150 tons.

Quotations for copper per pound at New York for the week ended Sept. 6 were as follows:

Tin.—Indications of the independence of tin consumers insofar as current supplies are concerned were in view last week when sharp advances at London and Singapore failed to cause concern among users. Sellers on this side marked up prices, but on the absence of buying support the market subsided. The trade has had another week of inactivity and to a certain extent the market has been a speculative affair, as evidenced by the fluctuations.

Straits tin at London opened the week with a £2 5s ad-

vance, but subsequently declined to £170 10s, a drop of £2 10s. The Singapore market acted similarly, advancing to £175 and receding to £171 10s at the close. This market closely followed the movement abroad, with spot Straits closing at 38½ cts., at which price some sellers offered freely. The August deliveries were disappointing, amounting to only 4335 tons on both coasts; while the stocks and landing on Aug. 31 aggregated 4756 tons, a record-breaking figure.

The poor statistics influenced London and Singapore adversely this week, as expectations were that deliveries would run in excess of 5000 tons. The heavy stocks were not considered a depressant, as much of the tin at the seaboard is already owned by the large consumers and cannot under the guarantees be resold, despite the falling market. At this writing spot Straits is held at 38¾ cts., with October quoted at 38¾ cts. and November and December at 38½ cts.

Quotations for tin per pound at New York and per ton at London and Singapore during the week ended Sept. 6 were as follows:

Aug. 31	New York		London	Singapore
	Spot	Sept.	Straits, spot.	shipments.

Lead.—The market has lapsed into dullness and dealers who were holding nearby metal for further advances offered freely, their offers being further pressed by fears of a railroad strike. Spot metal as a result eased off to 6.50 cts. St. Louis, but the market for lead delivered New York held steady at 6.55@6.70 cts., although now that the railroad matter has been settled the eastern market may also ease off.

The position of lead is very strong. Independent producers are well sold up for September and have taken a considerable line of business for October delivery, price to be fixed at the A. S. & R. Co. quotation for that month. The situation as respects price changes this month is clouded. No hint as to what the principal producer will do can be obtained, but in view of the prevailing dullness there are some who believe that the quotations of 6.50 cts. New York and 6.42½ cts. St. Louis will be continued.

Canadian consumers who furnished the main support to the market on the recent rise are now well covered, while domestic users are also adequately supplied. Therefore, producers are not looking for another excited period this month unless Russia suddenly comes into the market, in which event prices will spring forward, in view of the scarcity of metal.

The London market has been very steady, with prices advancing, spot going up 12s 6d to £31 5s and futures 7s 6d to £29 17s 6d last week.

Quotations for lead per pound at New York and per ton at London for the week ended Sept. 6 were as follows:

Lead Ore.—In the Missouri-Kansas-Oklahoma district during the week ended Sept. 2 practically the same conditions prevailed in the district. The water supply is still short and with low prices there is little incentive to try for a heavier production. Prices were from \$65 to \$67 and the production for the week totaled 2,360,980 lbs. bringing the production for the year to date at 70,842,473 lbs. of concentrates. These respective productions were valued at \$76,570 and \$3,002,054.

Zinc Ore.—The stacking up of ore supplies due to the threatened railroad strike made considerable buying during the latter part of the week when fears of the threat were done away with and the prices due to the larger supply on hand were down \$5, the better grades bringing \$65 and this price ranging down to \$45. The week's production was 11,325,050 lbs. and the year's to date was 445,629,374 lbs. Values of these amounts were placed at \$329,876 and \$19,906,509.

Calamine.—With a dull market for its allied ores calamine was off \$5 the past week and brought from \$35 to \$45. Production was up again to its prevailing figure and 422,300 lbs. of concentrates were produced during the week, making the total for the year 20,632,610 lbs. The week's production was valued at \$8654 and the year's at \$737,536.

Spelter.—The situation in spelter has undergone no change since our last report. The market has been very dull, with prices receding, although the factors that are causing the lower prices are the subject of conflicting views, some attributing the weakness to producers and others to speculation by dealers. In any event the market has been abnormally quiet and interests who formerly took an optimistic viewpoint on the future of the metal are now beginning to feel that overproduction has furnished a corrective towards the high prices. Foreign demand was the dominant support to the market, and with England now pressing its policy to free itself of American spelter the problem of maintaining the market is a difficult one to solve, especially in view of the fact that some copper companies producing spelter as a by-product at a low cost are in a position to sell much lower than prevailing prices and still obtain profits.

Spot spelter has been offered down to 8.87½ cts. New York and it was not difficult to shade to 8¾ cts., while for the fourth quarter sellers freely offered at 8¾ cts., although

no business could be traced as having been closed at this price, or any other price, for that matter.

The London market has declined rather sharply, with cables reporting that English producers were seeking to liquidate spot holdings, while Americans were offering futures freely, indicating a renewal of shipment of consignment lots to the English market. Spot spelter at London declined £7 last week, while future dropped £3.

Quotations for spelter per pound at New York and per ton at London for the week ended Sept. 6 were as follows:

MISCELLANEOUS METALS.

Tungsten.—The market has continued its activity and again over 200 tons have changed hands; and prices ranging around \$20. For a special quality ore, as much as \$22.50 was paid for immediate delivery. During the past week one feature of the market has been the fact that since a very long time, a contract has been made for forward delivery. Business has been done for October and November shipment for some quantities and it appears as if buyers have come to the opinion that the market has touched about bottom. Besides the 200 tons mentioned above for spot, 250 tons changed hands for home consumption.

Quicksilver.—Improved demand from powder makers and smaller receipts have acted to strengthen this metal. Prices have been advanced to \$80 per flask for spot virgin, with sellers reporting users freely seeking metal, but little to be had. Some large export business has been closed in the past week and indications are that England has been a steady buyer since the first of August.

Antimony.—The boom is over. Business in antimony is poor and sellers have resumed price concessions in an effort to stimulate sales. The recent buying spurt served to clear the market of spot metal, but arrivals have again created stocks and sellers are finding it difficult to attract buyers. Spot metal has been offered down to 12½ cts. and in some cases 12¼ cts. has been quietly quoted. Some Chinese interests recently sent out advices that conditions in China arising from the revolt were causing small producers to suspend operations and that a scarcity of antimony was likely, but these advices were considered as being representative of the customary Asiatic method of seeking a support for the market.

Finished Copper, Brass and Other Products.—There has been no change in prices on finished goods, but the market is very strong except in zinc sheets. Makers report an active demand, with many of them booked full over the rest of the year.

Platinum.—A sudden and sharp spurt developed in platinum last week, the price advancing \$15 an ounce to \$80 an ounce. Refiners declared that increased demand and smaller supplies had caused the advance.

Ferromanganese.—Although the English government

has continued its policy of limiting licenses for shipments of ferromanganese, the market is quiet and somewhat easy. Spot English 80% was offered at \$160 seaboard by one seller, but others continued to ask \$170 seaboard for unrestricted.

Pig Iron.—Further improvement in pig iron as respects both demand and prices has been noted. Some large tonnages have been purchased and furnaces are intimating that prices will soon go up sharply. The Worthington Pump & Machinery Co. took 16,000 tons foundry irons for the first half, while in the west some round lots as basic iron figured in the week's business.

Surface Tension of Oil-Water Emulsions—A Flotation Theory

GEORGE BELCHIC* and ROY O. NEAL.**

Many theories to explain the process of oil flotation have been advanced by various investigators with a view of bringing flotation from an empirical to a more scientific process. The fact that the flotation process is adaptable to most sulphide ores has made this process of paramount importance in ore dressing. Although successful flotation has been accomplished without the use of oil, as in the Delprat process, today, with but few exceptions oil is used.

The part played by the oil in producing successful flotation has held the attention of many investigators for a long time, because, if it were possible to definitely point to a specific value of the oil in the flotation process, much labor and time could be saved in the successful treatment of a particular ore by flotation.

Confining ourselves directly to oil flotation, we find in the literature on this subject that various investi-

gators believe that the following explains the value of oil in flotation:

T. A. Rickard: "The addition of oil lowers the surface tension and imparts a decided viscosity to the surface of water."

C. T. Durell: "That oil not only toughens the air bubbles, but exerts a cohesive force on the oil-coated metallic particles."

O. C. Ralston: "That the addition of oil to water decreases the surface tension of water."

T. M. Bains, Jr.: "From an electric standpoint, oil will insulate the air bubbles and prevent the dissipation of its charge."

George Huston: "Oil is needed to form a surface film, so necessary for the preservation of the air bubbles."

The above shows that in general, investigators have not reached similar conclusions with regard to the part played by oil in flotation.

In order to bear out the assumptions made by various investigators that oil reduces the surface tension of water, and thus allows the air bubbles to exist when they reach the surface of the water in the flota-

tion machine, the authors undertook to measure a series of surface tensions of mixtures of oil in water.

In this investigation the flotation machine used was of the Minerals Separation type, consisting of an agitating and floating cell, with a propeller and blades to mix the pulp and beat air into it.

The capacity of the agitating cell of this machine was 2000 grams of water and 400 grams of ore, making a dilution of 5:1. In making the surface tension measurements, 2000 grams of water and 1, 2, 3, and 5 grams of oil were used. Of course, no ore was added in these tests. The oil and water were agitated for 7

4. Neutral water with 1, 2, 3, and 5 grams of a series of oils.

5. Alkaline water with 1, 2, 3, and 5 grams of the same series of oils.

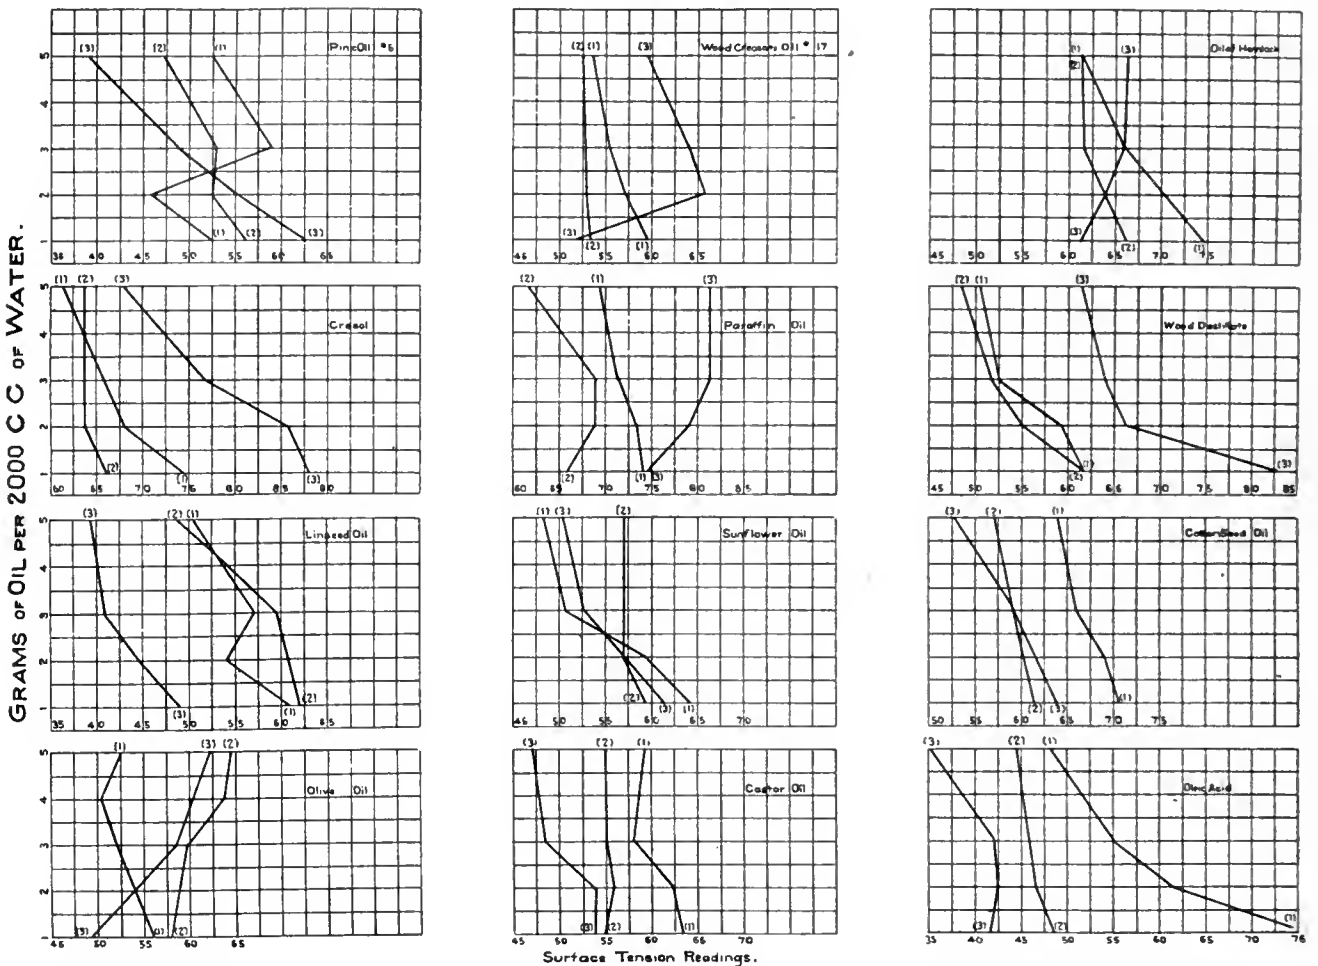

6. Acid water with similar quantities of the same series of oils.

The surface tension measurements are shown in table I and table of curves.

Discussion of the Results.

The discussion of the results is taken up under the following headings:

Curves of Surface Tension Measurements.

NOTES.—(1) Water neutral. (2) Water acid: 2 grams H_2SO_4 per 2000 c.c. H_2O . (3) Water alkaline: 2 grams $NaOH$ per 2000 c.c. H_2O .
 Surface tension by the Capillary Method at 22° C. (71.6° F.). Surface tension at 22° C. water—89; water + H_2SO_4 —60; water + $NaOH$ —88.

minutes, a sample of the mixture, or oil-water emulsion, was removed and immediately its surface tension ascertained by the capillary method. Since acid and alkali are now commonly used with oil in flotation, a series of surface tension measurements were made with the addition of acid and alkali.

The following surface tension measurements were therefore ascertained:

1. Neutral water alone.
2. Alkali water alone.
3. Acid water alone.

1. Surface tension measurements when neutral water is used.

2. Surface tension measurements when acid water is used.

3. Surface tension measurements when alkaline water is used.

It is important to note first that the addition of sodium hydroxide to water hardly makes any perceptible difference in the surface tension. The surface tension of neutral water, as shown in the table, is 89, while that of water and sodium hydroxide is 88.

This would then indicate that a small addition of sodium hydroxide (2 lbs. of sodium hydroxide to a ton of water), has no effect upon the surface tension of water.

The addition of sulphuric acid (2 lbs. to a ton of water), decreases the surface tension of water from 89 to 60.

Surface Tension Measurements When Neutral Water is Used.

In looking over the surface tension measurements when neutral water is used, it is seen that all of the oils reduce the surface tension of the water. However, there is no relation between the amount of reduction in the surface tension of water and the surface tension of the oil. For example, pine oil No. 5 and oleic acid have surface tensions of 23.3 and 23.7 respectively. yet 1 gram of pine oil reduces the surface tension of water from 89 to 52, while 1 gram of oleic acid reduces the surface tension of water from 89 to 74.

Cresol has a surface tension of 44.5 and castor oil 43.5; equal quantities of the two oils produce different reduction in the surface tension of water. If successful flotation depended upon a particular surface tension reading of an oil-water emulsion, it is seen from the table that it would require 3 grams of cresol to the 1 gram of castor oil to produce a surface tension reading of 66. Furthermore, if the above assumption would hold, then many oils would be precluded from the list of successful flotation oils. In other words, if only 4 lbs. of castor oil to the ton of ore is necessary to produce successful flotation, by reason of establishing the necessary surface tension measurement, of the oil-water emulsion, then it would require about 12 lbs. of cresol oil to produce equal results.

Another interesting comparison is that of paraffin, hemlock and wood-distillate oils, having surface tensions of 30.1, 30 and 30.1 respectively. The addition of 1 gram of these oils to water reduces the surface tension of water from 89 to 73.92, 89 to 61.6, and 89 to 61.6 respectively.

Surface Tension Measurements When Acid Water is Used.

The surface tension of acid water, as shown in the table, is 60. The effect of adding oils to acid water is either to increase or decrease the surface tension. With the addition of larger amounts of the same oil, the surface tension is decreased, with but one exception, olive oil.

Surface Tension Measurements When Alkaline Water is Used.

While the oils in this series of measurements do not show a surface tension increase above that of alkaline water alone, it is, however, significant to note that a number of them increase the surface tension with the increase in the added amounts of the oil. For example, olive, wood creosote No. 17, and paraffin oils

show higher surface tension readings when 5 grams of the respective oils are added to the alkaline water than the readings shown by the addition of only 1 gram of the respective oils.

Summary.

The conclusion drawn from the table of results indicates that large quantities of oil added to water (acid, alkaline and neutral) do not necessarily produce a marked reduction in the surface tension of water. In some cases, as with acid water, the surface tension is even increased above that of acid water alone; and with alkaline water, large quantities of some oils increase rather than decrease the surface tension.

What is then the value of oil in flotation? In closely observing the action of the various oils when agitated with water, it was found that each oil formed a somewhat different foam. That is to say, that the foaming power of one oil differs from another. While nearly all oils produce a foam with alkaline water, many of them do not with acid or neutral waters. The amount of air included in the foam varied likewise, so that the ability to produce a persistent bubble foam appeared to be independent of the surface tension. For example, while pine oil No. 5 foamed more copiously with alkaline than with neutral and acid waters, yet the surface tension reading is higher in the former case, when 1 and 2 grams of oil are added.

The writers are of the opinion, therefore, that the foaming power of an oil should be closely studied, rather than the effect of the oil upon the surface tension of water. The mere fact that an oil has the property of causing a reduction of the surface tension of water when added to it in either large or small quantities, does not qualify it as a good flotation oil.

Finally, surface tension alone cannot any more be regarded as a theory to explain the process of oil flotation than can the electrical theory, or any other theory; but by combining all the possible phases relating to oil flotation a good working theory may be eventually brought forth.

The experiments were made in the laboratories of the Division of State Chemical Research, University of Kansas, Lawrence.

British Imports of Manganese Ore.—British imports of manganese ore in July were 33,817 gross tons, against 50,826 tons in June. The total imports to August 1 were 259,309 tons, against 154,158 tons to August 1, 1915. The monthly import rate to August 1, this year, has been 37,044 tons, against 22,022 tons per month in the same period in 1915. The 1913 and 1914 rates were 39,953 tons and 50,098 tons respectively per month.

In the exploitation of new ground, the elevation of ore bodies in contiguous territory is a basis upon which to determine the depth to carry on prospect work.

A New Flotation Oil from Sage Brush.

MAXWELL ADAMS.*

Considerable interest has recently been developed in sage-brush oil because of its possible utilization as a flotation agent in the mining industry. A list of some of its physical properties, together with the method used in its extraction, may prove of interest at this time.

Something over a year ago, a study of the essential oils in desert plants was begun in the chemical laboratory of the University of Nevada. None of the oils so far studied possess properties of special interest to engineers, except the oil of sage, *Artemisia tridentate*, which has exceptional power as a flotation agent. This plant, known as common sage brush, also called black sage, is widely distributed over the semi-arid west, being found quite generally on most of the dry plains and mountains west of Missouri.

The method of extracting the oil followed in these experiments is very simple. The leaves, twigs and small branches are placed in an airtight drum, having a capacity of about 27 cu. ft. Steam is admitted through a number of small openings at the bottom of the retort, and the pressure maintained at 20 to 25 lbs. per sq. in. for 3 hours. The escape of the steam from the retort is regulated by allowing it to pass through a stop-cock into a condenser. The water in the receiver is drawn off from time to time and the oil, which is insoluble and floats upon the water, is thus collected. At the end of 2 hours most of the oil has been driven out, though traces continue to come over for a much longer time. By raising the pressure, the time required could probably be shortened and the yield increased, but the lack of laboratory equipment has prevented the carrying out of this experiment.

The stock wood, bark and branches contain no oil, the distribution of the oil being limited to the leaves and young shoots. There is a seasonal variation in the amount of oil contained. Samples collected on different dates gave the following amount of oil: May 1, 0.42%; May 27, 0.6%; June 30, 0.72%; Aug. 1, 0.9%; Sept. 10, 1%. The increase appears fairly constant from early spring, when the leaves first appear, until light frosts occur in the autumn. When the plant is air-dried there is some loss of oil, as the following data will show: Two 100-lb. samples were collected at the same time. One was distilled when green; the other was air dried for 10 days before distillation. The green sample yielded 275 grams, and the dried sample 248 grams of oil, showing a loss of about 10%.

A laboratory experiment can furnish little data useful in forming an estimate of the commercial cost of production. A man working for 6 hours, and using a pair of common pruning shears, collected twigs which yielded 1 lb. of oil. Since only a small percentage of the oil is lost if the brush is dried, the most

economical method of production would perhaps be to collect it in large quantities, by using a tractor engine and a drag, in some such way as land is cleared for farming. When the brush is dry, the leaves and young shoots are easily shaken from the limbs. Thus the amount of material to be distilled would be greatly diminished and the oil perhaps obtained at a cost and in quantity sufficient to make it available as a flotation oil, if not alone, possibly as an ingredient, to increase the flotative power of other oils.

The crude oil is dark in color. When redistilled with steam it is water-white at first, changing gradually to a straw-yellow color upon standing. It has the following physical properties: Density at 15° C., 0.9206. Refractive index at 20° C., 1.4732. Rotation at 20° C., -4.69. At 98° C., a light oil, with a very sharp and pungent odor, begins to distill, but only after the temperature is above 165° C. does rapid distillation take place. At 180° C., the oil turns dark and decomposition begins. At a pressure of 12 mms., and below 125° C., almost all the oil can be distilled.

The chemical properties of the oil are as yet undetermined. There are small quantities of alpha and beta pinene. The main part of the oil has a camphor-like odor and taste, but has failed to give the ordinary tests for ketones. The fraction boiling at 175 to 180° C. has some of the properties of ordinary cineol, but is acted upon by metallic sodium, which indicates that the chief ingredient is not cineol. The chemical composition, which has little interest in this connection, will be worked out later. The important question for the engineer is: Can the oil be produced in quantity and at a cost that will make it available for ore flotation?

Pig Iron Production for First Half of 1916.

The bulletin just issued by the American Iron and Steel Institute shows that the production of coke pig iron in the United States for the first half of 1916 amounted to 19,347,935 tons, compared with 17,473,500 tons in the second half of 1915. Including the production of charcoal pig iron, which amounted to 191,996 tons, and anthracite and mixed anthracite and coke pig iron, which amounted to 79,591, the total production of all kinds of pig iron for the first half of 1916 amounted to 19,610,522 tons. This pig iron as to grades consisted of 8,830,085 tons of basic, 6,839,177 tons of bessemer and low phosphorus, 3,086,410 tons of foundry grades, 460,839 tons of malleable, 169,306 tons of forge, 189,046 tons spiegeleisen and ferro-manganese and 44,659 tons of other grades.

By a special process of annealing, toughness and malleability may be developed to a remarkable degree in white cast iron. In this way castings are made to answer for forgings in many cases.

*Arizona Meeting, A. I. M. E.

Mining Operations in Bingham Camp, Utah

W. A. SCOTT.

The group of mining properties operated in Bingham canyon, Utah, by the United States Smelting Co. comprises the Galena, Telegraph, Niagara, Last Chance and others. Operations are carried on without hoisting ore and without pumping water. A main haulage and drainage level was driven 6,000 ft. from the canyon to the Galena workings, connecting with Galena shaft at a depth of 730 feet. Branches were driven from this main level to connect with other centers of operation. One branch, 2000 ft. long, was extended into Telegraph ground; another branch of 1000 ft. taps the Niagara; a 2500-ft. drift northwesterly runs on the contact of limestone and quartzite, and another 700-ft. drift is being extended along the line of Last Chance vein.

This main level, and more than 4000 ft. of branches, are equipped with tracks of 30-lb. rails, laid upon heavy ties. Ore cars of 8 tons' capacity, 2-ton cars for waste, and timber trucks, are drawn by pneumatic locomotives, which are supplied with air by high-power compressors. The compressed air is conducted into the tunnels through a special pipe line, which connects with charging stations, where air at 1100-lbs. pressure may be transferred to the locomotives.

There is one station near the tunnel entrance; the next station is 1000 ft. in, and the third being 4500 ft. from the portal. The air is let into the locomotive engines through reducing valves, whereby the pressure is reduced to 250 lbs.

In ordinary use in this system of haulage, the locomotive, on being charged at the entrance, runs in 4000 ft., where it is again charged for a run to the farthest ore chutes and return.

The compressor plant for supplying air to locomotives is situated near the tunnel entrance. A small locomotive of this type is operated on the 400-ft. level from Galena shaft, for moving ore to a chute that connects with the main haulage level.

All ore being mined is taken from stopes above the main tunnel, and is hauled out through that channel. Some waste is being hoisted to the surface through the Galena shaft; but future plans contemplate the disposal of all waste in the old stopes.

Ore being shipped from this group to the smelters and concentrator at present amounts to 450 to 500 tons per day. In some of the stopes is mostly a copper sulphide, while that found in other stopes is practically all lead sulphide. All ore contains some gold and silver and a small percentage of zinc. About two-thirds of the lead ore is of milling grade. Treatment at the company's mill at Midvale results in three products—lead, iron and zinc concentrates. In the wet concentrating mill a zinc middling is obtained which is further concentrated by an electrostatic process. The lead ore of smelting grade is sent to the company's

own smelters at Midvale; the copper ore to the American Smelting & Refining Co.'s smelter at Garfield.

Utah-Apex Property.

The Utah-Apex mine and mill, on Carr fork, are operated under directions of Wm. L. Creden, managing director, and V. S. Rood, general superintendent. The main transportation level, starting close to the bed of the canyon, runs 3000 ft. to the shaft, and has been extended 2000 ft. beyond that point. This interior shaft has been sunk 500 ft. below the tunnel level, and is being raised from that level to the surface, 1000 ft. This raise is now 300 ft., operations being conducted by means of an air hoist at that point, which is the 700 level, measured from the surface. A new double-drum electric hoist, to be operated by a 500-hp. motor, is being set in position at the surface, to be put in service as soon as the rising shaft is completed. This will open a continuous shaft to a depth of 1500 ft., or to a point 500 ft. below the haulage level.

A section of the mine above the 700-ft. level was formerly operated through an old inclined shaft, which will be abandoned as soon as the new shaft and equipment are completed. The water that accumulates below the haulage tunnel is raised to that level by a pump stationed at the bottom of the shaft. The raising of this shaft and the installation of hoist and accessory equipment involves the expenditure of close to \$100,000. Within the last three years two air-compressors have been installed at the tunnel entrance. These are Ingersoll-Rand, electric driven, belt connected.

The company is mining 400 tons of smelting ore and 200 tons of milling ore per day. The smelting ore carries 13 to 16% lead, 12% zinc, and 4 to 5 ozs. silver. This is a sulphide and is shipped to the plant of U. S. Smelting Co. The mill ore, which is quite silicious, runs 9 to 10% lead, 3 ozs. silver and about 1% zinc. The concentration of 3½ tons into 1 results in the elimination of most of the silica by jigs and tables. The jig product and coarse table concentrate amounts to 60% of the recovery. The jig tailings are reground and passed to classifiers, the spigot material going to the tables and the overflow, to Janney flotation machines, these being preceded by two emulsifiers. There are 12 Janney cells, the first nine being roughers, the last three being cleaners. The capacity of the mill is to be increased from 200 to 300 tons per day by Jan. 1.

Highland Boy Property.

The Highland Boy mine, situated farther up Carr fork, is producing 1250 tons of ore per day, all of which is transported to the plant of International

Smelting Co., over the Highland Boy's 4-mile aerial tramway, which has a carrying capacity of 100 tons per hour. The ore is of two classes, which are mined and transported separately, consisting of 1050 tons of copper and 200 tons of lead ore per day. The copper ore runs about 2%, the lead ore running about 16%, with 4 ozs. silver. The entire mine output is hauled out through the main tunnel level to the tramway terminal.

At a point on the tunnel, 900 ft. from the entrance, is an incline shaft, at 45°, which goes to a vertical depth of 600 ft. This is a 3-compartment incline; 4-ton skips are being operated in two of them, by which the ore is raised to the tunnel level and dumped into shipping pockets. The waste is disposed of by filling in the worked-out stopes. The water in lower levels is pumped to the tunnel level by two Prescott station pumps, set at the base of the incline. These are electric driven, and handle 250 gals. per minute. The Highland Boy belongs to Utah Con. Mining Co., Fred Cowans, Salt Lake, being general manager; A. S. Winther is superintendent.

The Utah Metal.

The Utah Metal & Tunnel Co., C. H. Doolittle, general manager, controls Bingham & Newhaven mine and mill, the Utah metal mine and other contiguous properties. Included, is the Utah metal tunnel, 12,000 ft. long, extending from a point on Carr fork, below Bingham & Newhaven, through the mountain range to Middle canyon, on the Tooele side. Good bodies of ore were opened on the course of this tunnel, near the Carr fork end, shipments of which are being made direct to the smelter by railway. Bingham & Newhaven ore and concentrates are shipped to International smelter over the Highland Boy's aerial tramway, same being let down through chutes to loading bins on the Highland Boy haulage level.

A source of revenue to Utah Metal & Tunnel Co. is from a supply of water piped from Middle canyon through the long tunnel and sold to Utah Copper Co. for steam shovel, boiler and domestic use along Bingham canyon.

About 225 tons per day of Bingham & New Haven ore is concentrated in its mill, making 90 tons of concentrates that run about 12% lead, 3.87 ozs. silver, 27% iron, 0.8 to 1% copper and 0.23 oz. gold. Besides this, about 100 tons of ore per day are shipped direct to the smelter.

The mill is equipped with crusher, rolls, trommels, jigs, classifiers, tube mill, tables and slimers, making several grades of jig, table and vanner products. As an auxiliary to this mill, a flotation plant is being constructed in a separate building, to retreat the slimes from the gravity concentrating mill. The plan is to pass the slimes through Dorr classifiers and thickeners, after which it will pass to Pachuca mixers, where the oils will be introduced before being treated by flotation machines, which consist of Callow cells—four

roughers and one cleaner. The new plant is expected to be ready for operation late in September. G. E. Adams, mill superintendent, has the work well in hand, and expects to make the flotation plant a profitable adjunct.

Bingham Coalation.

Bingham Coalation Mines Co., controlling the Redwing, Butler-Liberal and Massasoit properties in Markham gulch, is under the management of A. T. Hastings, Bingham, who has a number of short-term leases in force, some shipments from which are being made. The company is developing on the several fissures of the group, and expects to sink a new shaft on the Butler-Liberal.

Dump Car Ladle Easily Loaded.

The ladle or tank of a dump car, when loaded with molten metal or slag, weighs about 20 tons. Also, it is terrifically hot. To swing this ladle by a crane, from the furnace, and set it in the dump car yoke is difficult, if the yoke is so arranged that any delicate adjustment is necessary to get the ladle in place. The yoke arrangement shown in the illustration permits the trick to be turned easily and quickly. The ladle is

DUMP CAR LADLE EASILY LOADED.

conical and sets into the ring-shaped yoke, lowering easily into place without any see-sawing. Ribs in the ladle are then engaged by the simple locking device shown at the left. At the dump, the ring itself is tipped on the trunnions. Carl P. Astrum of East Orange, N. J., is the inventor, his patent being assigned to the M. H. Treadwell Co., of New York.

The strength of current employed in American electrolytic copper refineries is from 12 to 15 amperes per square foot of cathode surface.

Mining and Prospecting in National Forests

CHARLES S. BROTHERS.*

Broadly speaking, the rules relating to prospecting for mineral and the location, entry and patenting of mining claims within the National Forests are the same as those relating to the public domain. The law (Act of June 4, 1897), which defines the purposes of the National Forests and provides for their administration, states that "it is not the purpose or intent of these provisions or of the Act providing for such reservations, to authorize the inclusion therein of lands more valuable for the mineral therein, or for agricultural purposes, than for forest purposes." And, "any mineral lands in any forest reservation which have been or which may be shown to be such, and subject to entry under the existing mining laws of the United States and the rules and regulations applying thereto, shall continue to be subject to such location and entry notwithstanding any provisions herein contained."

The Government's Intention.

Also the following provisions of law are in the interest of the miner and settler:

"The Secretary of the Interior (now the Secretary of Agriculture according to a later law) may permit, under regulations prescribed by him, the use of timber and stone found upon such reservations, free of charge, by bona fide settlers, miners, residents, and prospectors for mineral, for firewood, fencing, buildings, mining, prospecting, and other domestic purposes, as may be needed by such persons for such purposes; such timber to be used within the state or territory, respectively, where such reservations may be located."

"All water on such reservations may be used for domestic, mining, milling, or irrigation purposes, under the laws of the state wherein such forest reservations are situated, or under the laws of the United States and the rules and regulations established hereunder."

"Nothing herein shall be construed as prohibiting the egress or ingress of actual settlers residing within the boundaries of such reservations, or from crossing the same to and from their property or homes; and such wagon roads and other improvements may be constructed thereon as may be necessary to reach their homes and to utilize their property under such rules and regulations for all proper and lawful purposes, including that of prospecting, locating and developing for mineral resources thereof: *Provided*, That such persons comply with the rules and regulations covering such forest reservations."

No comment on the law seems necessary; its purpose and intent are perfectly clear. Now, let us turn to the "rules and regulations" laid down by the Secretary of Agriculture and the Forester governing the field men actually in charge of the National Forests. The following are quotations from "The Use Book":

There is no restriction whatever on going on the National Forests for prospecting and locating mining claims. No permit is necessary.

The locator, or subsequent owner, of a mining claim has a right to the use of sufficient timber from his claim for development purposes. This includes the construction of such buildings as may be necessary as an adjunct to such development and the timber for shafts and tunnels, as well as for fuel in connection with such development. Timber, however, may not be cut from one claim to be used on another claim, even if it be of the same group, unless its use tends to develop the claim from which it is cut, as well as the one on which it is used, except under free-use permit.

Free use of timber may be granted to bona fide settlers, miners, residents, and prospectors for minerals, for firewood,

fencing, building, mining, prospecting, and other domestic purposes.

Supervisors may, with the approval of the district forester, designate as free-use areas, portions or all of any National Forest, and settlers, miners, residents and prospectors for minerals may cut and remove from such areas, free of charge and without permit, under such rules as may be prescribed by forest officers, any dead timber needed for their own use for firewood, fencing, buildings, mining, prospecting, and other domestic purposes. No timber may be taken under this regulation for sale to other persons or for commercial use.

Material may be cut outside of a free-use area without permit in cases of emergency or of immediate need. The person taking such material shall promptly notify the forest officer in charge of the district.

The administration of the National Forests is a duty imposed upon the Secretary of Agriculture by law. In order properly to discharge that duty, it is necessary that he ascertain the status of all lands within the National Forest. The examination of claims within National Forests by forest officers is therefore made primarily in furtherance of this object. The information thus obtained by the employes of this department is, as a matter of governmental economy, placed at the disposal of the Secretary of the Interior, upon whom rests the responsibility for determining the title to all lands within the National Forests.

A valid claim is one initiated in good faith under some act of Congress for the acquisition of title to public lands and continued by use consistent with the character of the claim and necessary for its actual development.

No claims can be initiated upon lands withdrawn for National Forest purposes, except under the mining laws, the coal-land laws, certain right-of-way laws, and under the act of June 11, 1915 (34 Stat., 233). Claims, however, within a National Forest, initiated prior to the withdrawal of the lands, or their inclusion therein, may be perfected and patents obtained by compliance with the law under which such claims were initiated.

Prospecting will not be interfered with and mineral locations will not be examined prior to application for mineral patent, except where a report is requested by the Department of the Interior or where locations interfere with the administration of the National Forest. No adverse report will be submitted to the Department of the Interior which has not been made by a mineral examiner. Prospecting may be carried on without obtaining a permit from forest officers.

Some Interesting Facts.

So much for the law and the rules and regulations. Congress, the Secretary of Agriculture and the Forester having done their part—let us see what can be shown in the way of performance on the part of the field men. In the very nature of things the showing cannot be complete since the great majority of prospectors and miners never come in contact with the forest officers except to pass the time of day or swap tobacco, but pursue the even tenor of their way undisturbed. However, the records of the Forest Service show some interesting facts in this connection. During the fiscal year ending June 30, 1915, 518 mining claims within National Forests passed to patent. Of these, 24 claims were in California. During the same time 17 claims in California were canceled by the Department of the Interior after hearings had been held and evidence presented on both sides.

The timber upon the 17 canceled claims amounted to 36,776,000 ft. board measure, whereas that upon the 24 patented claims was only 2,333,000 ft. Some of these canceled claims were not initiated by bona

*National Forest Inspector, Dist. 5, U. S. Forest Service.

fide miners or prospectors for mineral but by those who desired to secure title to the land for its timber. It is gratifying, however, that each year the number of attempts to use the mining laws to secure lands for purposes other than mining grows smaller. During the fiscal year 1915 favorable reports were made upon 17 mining claims in California and eight unfavorable reports were made. A large number of selections of land under the railroad and state school land grants have been protested. There were 59 of these protests pending at the end of the fiscal year, June 30, 1915, affecting lands in California. When these are finally disposed of such lands as are shown to be mineral in character will become available for prospecting and development under the mining laws.

During the fiscal year 1915, 40,015 free-use permits were issued to prospectors, miners, settlers and residents for 123,168,000 ft. board measure of timber, valued at \$206,464.13, according to sales prices for National Forest timber. Data is not readily available to show what part of this went to the prospector and miner, but it is safe to assume that he got a liberal share of it.

This much for law established by Congress, rules and regulations established by the Secretary and the Forester, and practice and performance on the part of the forest officers in the field. At the present time I know of no important difficulties existing between the Forest Service and bona fide miners or prospectors. I believe it is safe to say that everything of that kind has disappeared in California due to a better understanding on both sides.

Limits to the Miner's Rights.

While it is true that the United States is very liberal to the prospector and miner, it should not be overlooked that there are certain limits to existing laws and that the men in charge of the administration of the National Forests must observe these limits with the same good faith that they observe in carrying out the laws' most liberal provisions.

For instance, the right to cut timber for mining purposes extends only to the timber on the land embraced in the claim, or in claims of the same group when the workings in which the timber is used develop the claim from which taken. And a mining claimant can not lawfully cut or remove timber from his claim for sale or for purposes other than the development of the claim, except where a removal of the timber reasonably in advance of the mining work is necessary to the development of the claim.

The Department of the Interior and the courts have held that development work, for which timber may be cut on a claim, is restricted under the law to that work which directly facilitates the extraction of mineral from the ground. Therefore, timber for use in smelters, ore reduction works, etc., should ordinarily be purchased.

It is essential to the validity of a mining claim that

it shall be initiated upon the discovery of mineral for the purpose of developing a mine and not merely to secure title to the land for some purpose foreign to mining.

These limitations are not peculiar to National Forests but apply to all claims regardless of whether or not they are within a National Forest. Obviously, it is within the power of the claimants to aid greatly in the efficient performance of the public business by recognizing and observing these limits and by according to forest officers the same frankness and consideration which forest officers must show them.

Few Real Causes for Disputes.

Forest officers are not only custodians charged with the duty of protecting and conserving the forest resources but they are also agents of the people and must assist the public in making use of these resources. If there is just cause for complaint regarding the conduct of any forest officer, the matter should be taken up in writing either with the immediate superior of the officer complained against or with the Forester at Washington. In the interest of keeping "practice and performance" on the part of field officers up to the standard set by law and the rules and regulations, the service will welcome investigation of any unsatisfied complaint by officers or committees of any association or other organization of miners.

The purposes of the Forest Service and of the bona fide miner and prospector are not at variance in any particular and all differences will vanish in the light of mutual understanding and confidence. Let us always approach the subject in that spirit and with patience and frankness when apparent causes for differences arise.

Atmospheres Deficient in Oxygen.

Some recent tests or experiments by members of the Bureau of Mines may be summarized as follows:

Atmospheres that are deficient in oxygen begin to affect men when the percentage of oxygen is about as low as that affecting canaries and mice. Canaries are slightly more susceptible to "oxygen want" than are mice. In mixtures of air and nitrogen containing about 7.6 to 7.8% nitrogen canaries show pronounced distress. When the oxygen content is about 7% mice show considerable distress, and a man is in grave danger of dying; hence canaries and mice should not be used by exploring parties in mines to show when men unequipped with breathing helmets should retreat because the atmosphere is low in oxygen. Mice and canaries, especially the latter, are chiefly of value for indicating to exploring parties the presence of dangerous proportions of carbon monoxide. In an atmosphere in which oil-fed lamps will not burn an exploring party should not depend upon canaries for further guidance, but should use breathing apparatus in advancing into the atmosphere.

Semi-Annual Report of the American Smelting & Refining Co.

In reviewing the half year's operations of the American Smelting & Refining Co., President Daniel Guggenheim states that the profits of the company, during the period in question, make an abnormal comparison with the earnings of the same period in 1915.

During the first 6 months of last year, the prices of all metals were depressed, and the production of ores was correspondingly decreased.

But, during the past 6 months, the company has realized the reverse effect of the European war. Prices have been stimulated beyond any previous record, and this has inevitably resulted in a large increase of production.

On the other hand, the costs of operations have been very much higher during the past 6 months. Wages have been advanced and an 8-hour day introduced at all points. The cost of materials has been advanced 50%, and, in more than one instance, more than 100%. On this account, the profits per ton of ore smelted, or bullion refined, have been seriously reduced, due to the fact that the toll received from the mines and smelters has been fixed in long-time contracts, made when present costs were not believed possible.

The present favorable showing as to profits is due, partly, to a very large and abnormal increase in business, but, to a greater extent to the production of company mines and to new lines of business in which the company has interested itself, and which, it is hoped, will be increasingly profitable. A few years since, the business of the company was almost entirely the smelting of lead and silver ores, and the refining of the resulting bullion. This portion of the company's business has been far less profitable per ton of materials handled than during the same period of last year.

The company again records with regret the entire lack of earnings from the very valuable properties of the company in the Republic of Mexico.

Consolidated General Balance Sheet.

The following is the consolidated general balance sheet as of June 30, 1916, of the American Smelting & Refining Co., and American Smelters Securities Co.

ASSETS—	Amount.
Property Account:	
Cost of plants, properties of subsidiary companies and additions and improvements less depreciation and additions and improvements written off to profit and loss	\$112,047,705.49
Investment in Securities and Other Companies	558,412.63
Metal Stocks:	
Ore, bullion and factory product on hand and in transit	\$75,589,421.62
Less:	
Approximate value of metals purchased and on hand, payment of which is to be made in refined metals and not in cash	\$45,026,796.84
Unearned treatment charges	7,713,090.11
Total	\$52,739,886.95

Remainder	22,849,534.07
Working Assets:	
Materials and supplies	\$ 3,735,159.47
Prepaid taxes and insurance and suspended debtor accounts	325,871.16
Total working assets	4,061,030.63
Current Assets:	
Cash on hand and in transit	\$19,358,096.88
Loans secured by Stock Exchange collateral and bankers' acceptances	4,425,704.29
Loans secured by copper in process of refining	379,000.78
Advances to affiliated companies	403,825.21
Accounts and notes receivable	11,404,450.93
Total current assets	35,971,168.09
Cash, Securities and Accrued Interest in Funds:	
Sinking fund, American Smelters Securities Co. 6% 15-year debenture bonds:	
Cash with trustee	\$ 1,461,164.43
Accrued interest	69,075.00
Pension fund	620,419.84
Total in funds	2,150,659.27
Unextinguished discount on bonds	479,166.66
Grand total	\$208,117,676.84
LIABILITIES:	
Preferred capital stock outstanding:	Amount.
American Smelting & Refining Co. American Smelters Securities Co. Series "A"	\$50,000,000.00
Less amount deposited with trustee for redemption under stock retirement agreement	\$17,000,000.00
Series "B"	350,200.00
Total preferred capital stock outstanding	16,649,800.00
Common capital stock outstanding:	30,000,000.00
American Smelting & Refining Co. Debenture bonds outstanding:	\$96,649,800.00
American Smelters Securities Co. issue maturing Feb. 1, 1926	50,108,000.00
Less:	
Par value held by trustee in sinking fund	\$15,000,000.00
Remainder	2,763,000.00
Current Liabilities:	
Accounts, drafts and wages payable	12,237,000.00
Deferred payments on mining properties	\$15,510,866.74
Interest on debenture bonds:	
Unclaimed	21,250.00
Accrued not due	44,325.00
Dividends:	
Unclaimed	375,000.00
Payable after close of period	61,615.67
Accrued taxes not due	2,117,146.25
Miscellaneous	466,870.45
Total current liabilities	18,597,074.11
Reserve and Suspended Creditor Accounts:	
Reserve for enlargement and extension	\$ 1,900,109.83
Employees' benefit pension reserve	615,109.67
Fire insurance reserve	384,589.72
Safety and welfare	244,618.24
Miscellaneous	1,177,277.01
Total reserve and suspended creditor accounts	4,322,404.47
Profit and loss surplus	26,203,398.26
Grand total	\$208,117,676.84

The net income for the 6 months' period, applicable to the payment of dividends, amounted to \$11,145,693.89, or an increase over the same period of last year of \$6,125,711.87.

The last two quarterly dividends on the common stock were declared at the regular rate of 4% per annum, and 2% per annum extra.

After the payment of regular dividends on the preferred stocks, and at the rate of 6 per cent on the common stock, there was carried to the credit of surplus \$6,642,959.89.

During the past 6 months, the company has purchased new properties, and largely extended the capac-

ity of old works, at a cost of \$3,623,786.02. It is expected that at least an equal amount will be expended during the balance of the year for similar purposes.

Of this amount, there was charged to depreciation and ore depletion \$1,019,489.33, and to the reserve created out of the earnings of 1915 for enlargement and extension \$1,999,590.17. The balance, amounting to \$604,706.52, was added to the property account. The very large increase in the production of all character of ores has required an equal increase in smelting and refining capacity. How well this has been accomplished is evidenced by the fact that, although the daily product of the company, both in amount and in value, is much greater than at the beginning of the year, the total value of ores and furnace products on hand has decreased more than three-quarters of a million dollars. The inventory was taken at the same conservative unit values as in the past.

With the decrease in the stock of raw material there has been an increase of cash and demand loans of over \$5,000,000.

Income and Profit and Loss.

The following is a summary of the consolidated income and profit and loss.

	6 Mos. ended June 30, 1916.	6 Mos. ended June 30, 1915.
Net earnings of smelting and refining plants and industries immediately dependent thereon	\$10,132,100.73	\$5,234,925.47
Net earnings from mining properties	1,635,283.65	767,469.09
Total net earnings of operating properties	\$11,767,384.38	\$6,002,394.56
Other income—Net:		
Interest, rent, dividends received, commissions, etc.	1,461,674.25	754,958.68
Gross income	\$13,229,058.63	\$6,757,353.24
Charges against gross income:		
Administrative expenses	\$ 452,379.83	\$ 449,105.75
Research and examination expenses	106,484.37	23,492.23
Corporate taxes (including accrued income tax)	111,023.71	71,480.03
Interest on debenture bonds outstanding with public	368,987.50	388,680.61
Amortization of discount on bonds	25,000.00	25,000.00
Depreciation	889,972.15	779,612.60
Depletion of ore reserves	129,517.18	
Total charges	\$ 2,083,364.74	\$1,737,371.22
Net income for six months	\$11,145,693.89	\$5,019,982.02
Profit and loss surplus at the beginning of year	19,560,438.37	19,510,057.77
Profit and loss gross surplus	\$30,706,132.26	\$24,530,039.79
Less Dividends:		
On preferred stocks:		
American Smelting & Refining	\$ 1,750,000.00	\$1,750,000.00
American Smelters Securities Preferred "A"	499,494.00	504,900.00
American Smelters Securities Preferred "B"	750,000.00	750,000.00
Total preferred stock	\$ 2,999,494.00	\$3,004,900.00
On American Smelting & Refining common stock	1,503,240.00	1,000,000.00
Total dividends	\$ 4,502,734.00	\$4,004,900.00
Profit and loss surplus	\$26,203,398.26	\$20,525,139.79

New Concentrator for the Beeson Tungsten Property, Nevada.

H. M. Byllesby & Co., Chicago, who purchased the Beeson tungsten property, at Ragged Top, 22 miles southwest of Lovelock, Nev., have let a contract to Stearns-Rogers Manufacturing Co., Denver, for constructing a concentrating mill at Toulon siding, on S. P. Co. railroad, to treat the scheelite ore, now being

mined and hauled to Toulon. The plant is designed for 65 tons capacity, and will be operated by electric power. This is to be the first unit. Two caterpillar tractors and several teams are being used for hauling ore, the distance being 20 miles.

The ore occurs as a deposit in garnetized lime, at a contact of limestone and granite. Initiatory operations are carried on by open cuts and glory-hole methods. The accompanying illustration shows a cut and glory-hole, following a blast which broke 250 tons of ore. In addition to this, a vertical shaft is being sunk, and two tunnel levels are being driven in ore. The

GLORY HOLE ON RAGGED TOP TUNGSTEN MINE.

ore runs over 2% tungsten, and the plan is to concentrate to a shipping, marketable product. The mill is to be ready to operate in 90 days. The operations and instruction are under direction of Forbes Rickard, Denver, general manager and consulting engineer. Hubert C. Charles, local manager, is in charge of the Lovelock office.

The Ozokerite Field in Central Utah

HEATH M. ROBINSON.*

The largest district in the United States in which ozokerite has been mined and prospected is an area in central Utah a little more than 12 miles long and from 1 to 4 wide. The map shows the location of this field.

The main line of the Denver & Rio Grande railroad borders the field on the southwest, which is only from 1 to 4 miles wide, all the mines and prospects are within short distances of railroad facilities. Wagon roads have been built from many of the mines and prospects to shipping points on the railroad. As the mines have not been continuously worked, many of these roads have been little used and were found to be in poor condition at the time the field was examined.

Composition and Properties.

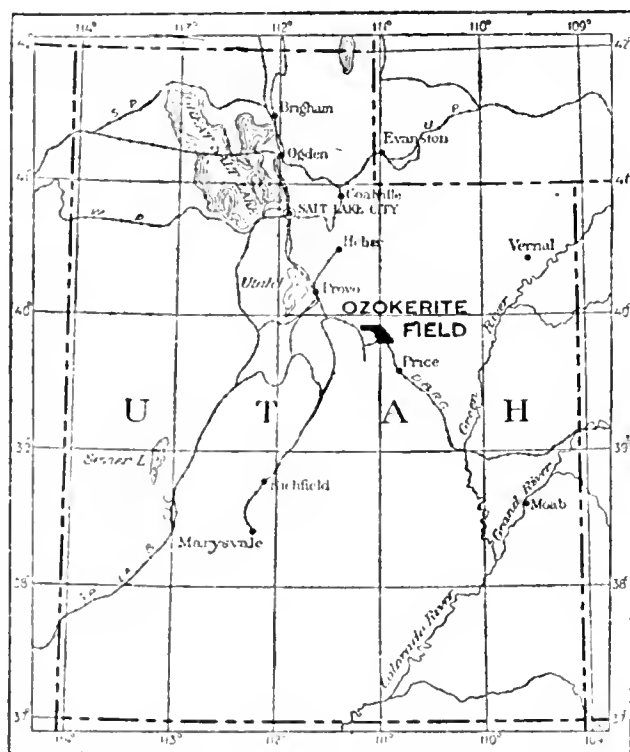

Ozokerite is a mixture of hydrocarbons in various proportions, the exact nature of which is a subject of dispute. Some authors consider that it is composed of members of the paraffin series; others place its chief constituents in the olefin series. In commenting on certain experiments, Redwood says: "The natural inference is that in addition to crystalline paraffin ozokerite contains certain colloidal substances (amorphous paraffin), the presence of which hinders the crystallization of the paraffin." In color ozokerite varies from black or dark brown to light yellow, but some specimens have a greenish color. It may be as soft as tallow or as hard as gypsum. The light-colored varieties yield the largest amounts of ceresin, the refined product. The melting point of ozokerite ranges, in general, from 58° to about 80° C., but a very few specimens have been reported to have a melting point at 100° C. Although paraffin with a melting point as high as that of ozokerite may be extracted from petroleum, it is not a commercial product, and the paraffin that is put on the market has a melting point considerably lower. The specific gravity ranges from about 0.85 to 0.97. Ozokerite is soluble in ether, petroleum, benzene, turpentine and carbon bisulphide.

Origin.

There appears to be a close relationship between ozokerite and certain kinds of petroleum. In a paper by Gosling an analysis of ozokerite is compared with one of American petroleum, and the comparison shows that the two substances contain the same compounds or fractions, though in different proportions. As would naturally be expected, the paraffin content of the ozokerite is higher than that of the petroleum. In the Galician mines all gradations between oil high in paraffin and ozokerite containing some petroleum have been observed. Some of the veins of ozokerite in the Utah field have a width about equal to that of thick

paper, a condition which implies a somewhat fluid state of the material at the time of impregnation and suggests that the substance which first filled the fissures was a petroleum rich in paraffin. Thus from laboratory and field observations all mixtures of petroleum and ozokerite are known to exist, and it may be concluded that the ozokerite of the Utah field is derived from a petroleum high in paraffin.

The passage from petroleum to ozokerite is thought by some geologists to have been accomplished by the oxidation and decomposition of the hydrocarbons of

SHOWING LOCATION OF OZOKERITE FIELD.

petroleum. However, the probability of the lack of oxidizing agents at considerable depths below the ground-water level would argue against this as a general process. On the other hand, it is now generally accepted that solid hydrocarbons, which of course embrace paraffin, exist in many crude oils at low temperatures. Kast and Seidner have found that the mud which separates out on the bottom of storage tanks containing crude petroleum is made up largely of paraffin, and they suggest that "this amorphous paraffin closely resembles and is evidently identical with ozokerite." Petroleum may be regarded as a solvent holding paraffin in solution, and on evaporation of the solvent the ozokerite is left as a residue. Slight changes in temperature, such as are found with increasing depth below the surface, would be a factor in solution and

*Abstract from Bull. 641A, U. S. Geol. Survey.

deposition, but this factor probably is not so important as evaporation of the lighter and more volatile oils of the petroleum.

The petroleum from which the ozokerite has been derived may have had two sources. It may have been derived from the overlying oil shale or it may have been forced up from lower beds. The bituminous material in the oil shale is largely made up of vegetal remains, and it is thought by Peckham that oil containing a large percentage of paraffin is indicative of a vegetable origin. On the other hand, Eldridge believes that the veins of solid hydrocarbons in the Uinta Basin, to the northeast, were formed by the forcing into the crevices and later rapid solidification of semifluid hydrocarbons. It would be interesting to know if the ozokerite contains more volatile oils in the lower levels of the mines than in the higher, or if the reverse is true, as such facts may have a bearing on the source of the petroleum from which the ozokerite has been derived. Analyses of the ozokerite compared with analyses of oil from the oil shale might possibly show some significant resemblances.

The Utah ozokerite field resembles in a number of places the Boryslaw field of Galicia, Austria, which is the most productive field of ozokerite. The Galician field is less than 1 sq. mile in area. The ozokerite is found in fissures, usually measuring from 2 to 12 ins. in width, which cut shale and sandstone of Miocene age that overlie beds of petroliferous shale. All gradations between solid ozokerite and petroleum rich in paraffin are found in the mines. The mine shafts in this field are very closely spaced and range in depth from 66 to 656 ft. Much of the semifluid material is under high pressure, and it is reported that certain of the mine openings have at times been filled by the squeezing of semifluid ozokerite. The Boryslaw deposits become narrower with increasing depth, and Redwood is inclined to believe that the ozokerite has been forced up from below.

Production and Concentration.

The first prospecting of this region was done in 1886. Since that time mining and prospecting have been carried on at irregular periods, for litigation has prevented continuous development. Exact figures for the production of the field are not available, and at the time of the writer's examination all the mines were inactive. According to statistics published by the Survey in the yearly reports on mineral resources, the Utah field produced over 640,000 lbs. of ozokerite previous to 1900, and it is reported by officials of the American Ozokerite Co. that the field has yielded about 120,000 lbs. since that date. The total output of the Utah field is only a small fraction of the quantity imported into the United States in a single year, but the production of the past is not a measure of the production that is possible under favorable market and mining conditions.

The following concise description of the methods of concentration used in the Utah field is given by Taff

and Smith: The manner of separating ozokerite from the associated rocks is a simple process. The plant * * * consists of a steam boiler and engine, a crusher, and steam-heated vats. The soft rock and ozokerite mixture is crushed and run into long vats with narrow bottoms containing water kept at a boiling temperature. The ozokerite melts at a temperature of 54 to 70° C. (129 to 158° F.) and floats off as a liquid into cooling vats, while the rock is driven out along the narrow bottom of the vats by revolving screws. On cooling the ozokerite is remelted into dry pans to remove the moisture.

Uses of Ozokerite.

Ozokerite is a nonconductor of electricity and is extensively used for insulating. Candles made from ozokerite have qualities superior to those found in other candles. Much of the ozokerite mined is converted into ceresin, a highly purified product which is used to replace or adulterate beeswax and has a variety of other uses. It is also used as a foundation for various waxes and polishes; as a covering to protect metal surfaces from the action of moisture, acids, or alkalies; and for wax figures and dolls.

Lagonda Boiler Tube Cleaners.

The one positive way to keep boiler tubes free from scale is to clean them frequently and thoroughly by mechanical means. In a new catalogue recently issued by the Lagonda Mfg. Co., there is a line of cleaning equipment described which is complete from cutter head to hose line. These cleaners are ball bearing, thrust bearing, steam, water or air-driven, designed

CLEANING A HEINE BOILER WITH CENTER DRIVE DIRECT MOTOR CLEANER.

for all sorts of conditions of service from moderate "cases" to the most stubborn found in the hard-water regions. For 20 years, these people have been making boiler tube cleaners, and the best of their experience is boiled down into this book, which is practical and worth having.

Mining in the Willow Creek District, Alaska

STEPHEN R. CAPPS.*

Mining in the Willow Creek district was continued in 1915 on about the same scale as in the preceding year. The output was derived mainly from the three mines that have been in active operation for several years, although a small single stamp mill was erected on one claim that has heretofore not been among the producers. As a result of the beginning of construction on the new Government railroad, which will pass along the edge of this district, prospecting was active, and plans are under way for active mining on several properties. In September, 1915, the writer spent about a week in the Willow Creek district, and visited all the working mines and many of the more promising prospects. The following notes on the various properties are not intended to be complete in themselves, but to supplement the more complete report by carrying the account of mining developments up to the fall of 1915.

Alaska Free Gold Mining Co.

The Alaska Free Gold Mining Co. operated throughout the open season and employed on an average about 50 men. The mill was run in three shifts of 8 hours each, as was also a part of the mine. In other parts of the mine two shifts only were worked. The capacity of the mill has been greatly increased by the installation, in 1914, of an additional Lane mill of 40 tons capacity and a 40-ton cyanide plant and by the elevation of the flume to give a head of 54 ft. at the Pelton wheel, instead of the 35-ft. head formerly used. During the season of 1915 both mills were in operation only a part of the time there being either not enough water available to operate both or not enough ore mined to keep both working to their capacity. All the tailings from the mill are now treated by cyanidation. It is reported that even with the greater depth below the surface from which the ore is now taken the tenor of the tailings after amalgamation remains fairly constant and is much the same for tailings from rich and poor ores alike. This fact indicates that even at considerable depth the gold in the veins is likely to be present predominantly in the form of free gold, and the ore from even deeper levels will probably be free milling. Three aerial tramways are in operation—two extending to openings on the Smuggler-Union vein and one to the Eldorado vein.

Since this mine was last visited, in 1913, much underground work has been done on the upper of the two main veins on the property. On this vein, referred to previously as the Skyscraper vein, but now known as the Smuggler-Union vein, the main tunnel has been driven along the vein to its outcrop on the southeast side of the mountain, a total distance of

380 ft., and from it stopes and winzes have been made. Two additional tunnels on the same vein have been driven. The upper one, about 100 ft. below the main tunnel, is over 250 ft. long, and the lower one, 175 ft. below the main tunnel, is 175 ft. long. Both the vein and the ore shoots have been shown to be continuous between the several levels. The vein, so called, in reality consists of two nearly parallel veins, of which the upper is locally referred to as the hanging-wall vein and the lower as the footwall vein. These veins are in most places separated from each other by several feet of diorite, though they are connected by numerous quartz stringers. Locally they diverge somewhat or approach rather closely, but in general each of the two maintains its own individuality.

On the Eldorado vein, which is apparently the southward continuation of the Smuggler-Union vein, an incline now 40 ft. long has been driven, and from it an aerial tram leads to the mill. It is expected that considerable ore will be supplied to the mill from this claim.

Gold Bullion Mining Co.

The Gold Bullion mine was operated in 1915 throughout the open season, beginning June 3. During that period the stamps were dropping for 24 hours a day, and two shifts were worked at the mines. About 60 men were employed. No increases were made in the mill capacity, but a 45-ton cyanide plant, installed in 1914, was operated, all the tailings from the mill and a quantity of stored tailings being treated by cyanidation. As the length of the milling season is controlled mainly by the period of adequate run-off in Craige creek, from which water for power is taken, a dam 13 ft. high was built across the basin of that stream, thus forming a storage reservoir of 13½ acres. Two smaller dams above give additional storage capacity, and the water thus impounded was expected to be sufficient to keep the mill in operation for a season several weeks longer than heretofore.

A large amount of underground work has been done since the property was last visited in 1913. In the fall of 1915 the No. 2 tunnel had over 930 linear feet of underground workings, not including considerable stopes. From this tunnel about half the ore mined in 1915 was taken.

The new Gold Dust tunnel was 360 ft. long in 1915, and the nearby No. 1 Gold Dust tunnel 200 ft. long, and a large area of the vein between them was stoped out, furnishing about half the season's supply of ore. The No. 3 Gold Dust tunnel had been driven to a length of 139 ft., the No. 4 Gold Dust tunnel about 45 ft., and the No. 2 Gold Dust, which contains a large stope, 65 ft.

The result of this underground development has

*Mineral Resources of Alaska; U. S. G. S.

been to keep the mill supplied to capacity with ore during the 1915 season, and to block out considerable ore bodies for future mining. The Gold Dust No. 3 tunnel follows a thick, strong vein said to be exceptionally high in gold.

Independence Gold Mines Co.

The property of the Alaska Gold Quartz Mining Co. was taken over by the Independence Gold Mines Co. in 1914. Since the transfer no important changes have been made in the surface equipment, although plans have been made for the installation of a new crushing mill. In 1915 the mill was put into operation on May 19 and, except for some short stops for repairs, was run continuously until the cold weather cut off the water supply. About 18 men were employed in two shifts. Although sufficient ore to keep the mill running was mined, the developments of the year were directed primarily to blocking out ore, in order to determine whether or not the installation of a new mill would be justified. The main tunnel, on the Granite Mountain vein, was driven to a total length of 540 ft. along the vein, and at a point 400 ft. from the portal a winze follows the vein down the dip for 70 ft. These additional developments show little change in character or gold tenor of the vein with increase in depth, although the breast of the main tunnel is now estimated to be 300 ft. below the surface. The veins show the same tendency to pinch and swell that they display nearer the surface; the ore shoots continue, and the ore is apparently as free milling as that taken from shallower parts of the vein. The driving of a long tunnel, to tap the vein at a lower level, is among the plans now being considered.

The upper or Independence vein was opened in 1914 and 1915 by one tunnel 105 ft. long and another 15 ft. long, and 240 ft. of stripping was done on the vein outcrop. The vein is in places 3 ft. thick, but in general has not been found to contain as much gold as the Granite Mountain vein.

Mabel Mine.

At the Mabel mine development work has been continued. The adit tunnel, begun in 1913, was driven about 75 ft. to the vein, and short drifts were run along the vein in both directions. In these workings the vein pinches and swells within short distances, and the quartz ranges from a mere stringer to a band 1 ft. wide. On the surface the vein has been exposed by stripping and open cuts almost continuously for a distance of about 2000 ft. and shows a persistent quartz vein from a few inches to about 2 ft. in thickness. The assay values are said to be encouraging. An aerial tramway to extend from the vein croppings to the mill site is on the ground, and it was said that a 20-ton mill was to be installed during the winter of 1915-16, to be run by water taken from Reed creek.

Miscellaneous Claims.

The Rosenthal claims, on the ridge between the basins of Fishhook creek and Little Susitna river,

promise to become productive soon. Some additional underground work has been done since 1913, and the extent of the ore body is now fairly well known, as the flat-lying vein crops out around the mountain top and tunnels pierce almost through the center. The ore broken in driving the tunnels has been banked at the portal and in the drifts, and a considerable amount is ready to be trammed to the mill. Control of the property has recently been acquired by the Alaska Free Gold Mining Co., and it is planned to erect an aerial tramway from this ground to the mill in the valley of Fishhook creek.

Prospecting has been vigorously carried on during 1914-15 on the claims of the Oregon group. A winding tunnel with a total length of 150 ft. has now been driven along an irregular quartz vein. The quartz is said to contain only moderate quantities of gold, but the main objective of the tunnel is to crosscut a fault zone that may be traced along the surface for some distance. It is estimated by the owner that a distance of 50 to 70 ft. still remains between the breast of the tunnel and this fault zone. It is said that at a point about three-eighths of a mile southwest of the tunnel the fault zone was ground-sluciced off to a depth at which the clayey gouge began to give place to solid pieces of quartz. The whole zone, to a width of 60 feet, is said to carry several dollars a ton in gold.

Prospecting has been done for some years on ground locally known as the Jap claims, lying on the northwest side of upper Willow creek, opposite the Gold Bullion mine. It is reported that a small 1-stamp mill, with a daily capacity of 200 to 300 lbs. of ore, was installed and in operation part of the 1915 season, milling ore of encouraging gold tenor.

Some additional underground development work has been done on the Mammoth claims, in the upper Willow creek basin, since that property was visited in 1913. It is reported that a crosscut 100 ft. from the portal of the main tunnel has been driven an additional distance of 30 ft., and from it a 40-ft. raise has been made. About 30 ft. of miscellaneous raises and drifts were also opened.

Gold Placers.

The only placer-mining operations of note within this district in 1915 were those on lower Grubstake creek and on adjoining portions of Willow creek. These operations were directed to prospecting the gravel benches, and hydraulic methods were available, as the hydraulic plant formerly used for mining on this creek is still in working condition. Work was carried on for only a part of the season.

British Iron-Ore Output in 1915—An estimate of 5,100,000 tons of iron ore obtained from quarries in 1915 brings the total iron ore mined in Great Britain to 12,976,105 gross tons which includes the 6,080,218 tons mined under the Coal Mines act and the 1,795,887 tons under the Metalliferous Mines act. The total in 1914 was 14,867,582 tons, and in 1913 it was 15,997,328 tons.

Hoist Recorder for Mine and Elevators

The accompanying illustration shows a unique hoist recorder for mines and elevators as developed by the Cleveland-Cliffs Iron Co. at its Salisbury mine, Ishpeming, Mich. This hoist recorder will furnish a complete record of the movement of the skip for each shift of 12 hours or less, showing the time taken in moving same from one point to another, showing all delays, the length of same and just where these delays occurred; also the number of loads hoisted from each level and the total amount hoisted daily. This record will also furnish valuable evidence in the case of accidents connected with the skip, delays and mistakes which occur from time to time, and which record will eliminate conflicting reports between men underground and engineer in charge of hoist, and a

made in three sizes; 15, 18 and 24 ins. high. As different make hoists necessitates the attachment being made in different places, the recorder can usually be attached to one of the following shafts: At end of drum shaft, on reverse shaft, indicator shaft, or any shaft which runs true and moves and reverses with the hoisting drum. The recorder should not be placed too far from the shaft to which it is connected, so as to cause loose motion in chain.

The means of recording the movement of the skip is simple. There are two drums mounted on vertical spindles, one drum being driven by a clock, winds the sheet from the other drum, so that when skip is idle, sheet is being wound on the first drum; the plan and exact length of time idle being registered by a pen which is attached to a nut working on the screw noted in the foreground. When the skip moves up or down the pen records such movement, receiving its motion through the chain, shaft, bevel gears and screw.

As it is essential to know the working conditions, these recorders are of inestimable value to any mining company. This device records every movement of the skip, together with a record of the kind of signals, and the exact time same were given so that it can be seen just where delays occur and whether caused underground or by the engineer in charge of hoist. The charts being made so that the position of the levels and important points conform with the same in the mine, these records can be read very easily. The record of the signals given is also very plain, as it shows just where the skip was when the signal was given, and the kind of signal given, so that if there was a mistake or delay in moving the skip, same will appear by the movement of the skip.

HOIST RECORDER AT SALISBURY MINE.

record which may be filed and referred to at any time.

Where electric signalling is in use this machine will record the signal given, so that where different signals are used for the different materials, it can be seen just what material is being handled, and from and to what point—also the exact time signals are given, so that it can be plainly seen whether delays are caused underground or on the surface. Where "Pull Ball" signalling is used a contact can be arranged which will give the same result in recording signals as where electric signalling is used.

The position and attachment of recorder is important. It should be placed where there is sufficient room and at a height convenient to get at it, about 36 ins. to top of stand for recorder. The base measurements of recorder are 16 by 16 ins., height depending on the depth of mine, the recorders being

Low Phosphorus Iron from High Phosphorus Ores.

The making of pig iron practically free from phosphorus and sulphur from an ore high in phosphorus is covered by a patent (U. S. 1,172,597, Feb. 22, 1916) granted to Paul L. T. Heroult, who died 2 years ago. Ordinarily molten pig iron from the blast furnace is transferred to an electric arc furnace where a basic slag, containing as much lime as possible and some oxide of iron, is applied to the bath with the current so regulated as to maintain a temperature sufficient to keep the slag molten and maintain a chemical reaction between the slag and the metal, leaving the carbon content of the metal unchanged or only slightly reduced. After the desired dephosphorization the first slag is renewed and a second substituted, consisting of lime and fluorspar with coke dust added, which removes nearly all the sulphur. It is claimed that this process produces from phosphoric ores a dephosphorized and desulphurized pig iron of the finest quality and at less expense than by any other process.

New Method of Extracting Zinc.

Several features in connection with a new process of zinc extraction are worthy of careful consideration, varying considerably from present practice.

(1) The method permits the use of reverberatory furnaces, simpler and more economical, commercially, than muffle furnaces.

(2) The process is a cyclic one, permitting a very high percentage of extraction, and leaving the residues, if valuable, in suitable form for further treatment.

(3) When roasting is required, the furnace gases are passed into an absorption tower and there supplied with a circuit solution (mainly zinc sulphate) so as to produce a dilute solution of sulphur dioxide, in turn employed in leaching the ore.

(4) The crushed material (previously roasted if necessary) is introduced into a filter press or leaching tank in such a manner that the first runnings of the solutions obtained from the filter press are rich in sulphates, while the subsequent solutions are mainly zinc sulphite.

The theory of this cyclic process is made plain by inspection of the graphic chart, Fig. 1, while the arrangement of the plant is shown in Fig. 2.

In Fig. 2, (A) is the roasting furnace, the gases passing into the absorption tower (B). From tank (B²), the circuit solution is delivered to the top of

FIG. 2. DURANT CYCLIC PLANT FOR ZINC EXTRACTION.

acid) and is separately stored in the tank (K). Finally solution containing free acid will leave the filter press; this solution is also separately stored in the tank (J).

If the solution contains only zinc sulphate, no oxidation is necessary. If it does, it is subjected to an oxidizing process to convert the zinc into sulphate. This is done in tanks (M) and (N).

Henry T. Durant of London, Eng., is the inventor of this process, which he has assigned to the Metals Extraction Corporation, Ltd., also of London.

Sane "Blue Sky" Law Permit.

H. L. Carnahan, California Commissioner of Corporations, has devised a method to afford protection to investors in shares of purely speculative value and has issued a permit to the Imperial Mining and Oil Realization Co. of San Diego. The company is acquiring undeveloped mining claims in San Diego and Imperial counties. Two of the claims in the former county near the Mexican border are first to be prospected. The commissioner permits the sale of 300,000 shares at 10 cts. per share, with the limitation that but 50,000 shares shall be sold until the proceeds shall have been expended in development work. If it can then be shown to the satisfaction of the commissioner and his engineer that the expenditure of further money is justified by the results obtained, the sale of the remaining shares to develop and equip the property will be permitted. Six hundred thousand shares issued to William Kelley and nine others interested in the exploitation of the company are required to be deposited in escrow and withheld from the market until the value of the properties has been established.

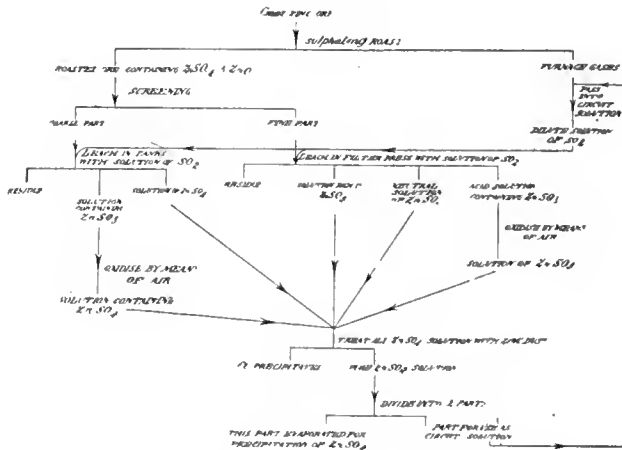

FIG. 1. CHART SHOWING THEORY OF DURANT PROCESS.

the tower, and the sulphur dioxide solution produced therein is discharged at the bottom into tank (C), which acts as a storage. (B) is a chimney for the escape of the flue gases.

The leaching tanks (DD²) are the ordinary kind, and (F) is a pulp tank where the non-leachable product is pulped up with circuit solution and pumped into filter press (E).

After the pulped up fines have been pumped into the filter press the circuit solution is pumped in by means of the washing pump by way of the washing inlet. As the solutions leached from the coarse material are exactly comparable with those that leave the filter press it is only necessary to consider these latter.

Yavapai County, Arizona, Mines and Mills

WILLIAM P. DE WOLF.

All of the mills and a majority of the mines in Yavapai county are working at capacity. The output of base metal and bullion—copper, tungsten, lead, zinc, gold and silver—is heavier than ever before. The output of ore is likewise greater than heretofore, and is steadily increasing as new ore bodies are opened and old mines for some time dormant are added to the active list. There has been no period when investors were so thoroughly interested in and capital was so generally available for the development of the mines here as now; and there has been no time when results were so thoroughly in keeping with the outlay of money, time and energy as now.

Local capital is responding to the development demands of the county's mines quite as generously as is capital from outside points. The condition is both commendable and noteworthy, as it demonstrates the confidence the local people have in their mines and their willingness to back their confidence. Neither they nor people from abroad are, however, investing their money in chimerical get-rich-quick mining schemes, such as have in past years cursed and cheapened the mining industry here. The Arizona Corporation Commission is inimical to them and they cannot gain a foothold here. As a result of the activities of the commission the mining industry of this county and state is being fostered along clean and progressive lines.

Among the mining propositions of this county which have of late received generous backing locally are the Loma Prieta Mines Co., Boston & Jerome Copper Co., Tip Top Con. Mining Co., the Tuscumbia Mining & Milling Co., Schuber Copper Co., Golden Dragon Mining & Milling Co., Bradshaw Development Co., Jerome Victor Extension Copper Co. and Venture Hill Mining Co. The last mentioned, although not of recent incorporation, is of late being reorganized by Prescott and Jerome mining and business men, most of whom have been holders of Venture Hill shares for a considerable period. These people have provided an initial development fund of \$18,000 and have pledged an additional \$12,000 for the same purpose, payable in 4 months. The company owns six patented claims in the United Verde copper belt at Jerome. At a meeting of the stockholders held in that camp on June 10 arrangements were made to resume mining operations.

The property of the Venture Hill Co. was first worked about 14 years ago. At that time, however, the price of copper was nominal; interest in copper issues was apathetic and the reduction charge was higher, with the result that the company, after varied financial vicissitudes, was forced to suspend mining operations. The holdings adjoin those of the Verde

Apex, Verde Con. and Hill Copper companies, and are adjacent to the United Verde and United Verde Extension companies. By reason of their proximity to the properties mentioned, the Venture Hill holdings are viewed favorably by investors and the company's shares are popular here.

Development work to date consists of a tunnel and a number of shafts of varying depth, many of which yield pay values at the present price of copper. The main copper-bearing dike lies about 100 ft. ahead of the present face of the tunnel, which has a length of 400 ft. The tunnel will crosscut this dike at a depth of 400 ft. A winze will be sunk at the intersection to determine the average grade of the ore below that point. Where sampled above, the dike yields pay values across a wide area.

Monthly dividend disbursements of 75 cts. per share continue to feature mining operations of the United Verde Co. The corporation started the current year by posting two dividends of 75 cts. each in January, since which time dividends have been paid monthly at the rate mentioned. W. A. Clark, owner of approximately 297,000 shares of United Verde, derives an income from dividends approximating \$222,750 per month, or \$2,673,000 per annum. The advance in the price of silver has of late been an important factor in the earnings of the company. The tonnage mined last year yielded 902,000 ozs. of silver, for which the company received an average of 50.607 cts. per ounce. This mine, first worked as a silver-gold property, has now reached the capacity of its new smelter at Clarkdale, which is to say the mine is now outputting 8000 tons of copper ore daily.

Superintendent George W. Salisbury of the Jerome Victor Extension Copper Co. has about completed unwatering the mine workings. Plans contemplate the lowering of the present shaft from a depth of 1225 ft. to approximately 1700 ft. Salisbury is well acquainted with the ore depositions at Jerome, having formerly been a member of the engineering staff of the United Verde Co.

The United Verde shaft is located within 1000 ft. of the Jerome Victor Extension shaft, and it is reported that the ore body on the 1500-level of the first mentioned has been stoped to the Victor Extension boundary line. It is also stated that the Victor Extension shaft was carrying stringers of 6% copper ore on the lower levels at the time the former owner—Haynes Copper Co.—was forced to close the mine owing to a lack of funds. One of the first acts of Superintendent Salisbury will be to determine the truth of these reports.

It is reported here that the pending deal has been closed for the passing of the control of the Arkansas

& Arizona Copper Co. to the Goodrich-Lockhart people of New York, and that the latter have taken possession of the mine holdings and books. The deal, as ratified, provides for the payment to the Goodrich-Lockhart people of 2,000,000 shares of Arkansas & Arizona for the properties of the Mowles Copper Co. and a year's option on 1,500,000 additional shares at 25 cts. per share. Reports from Jerome are to the effect that development work is immediately to be resumed.

Important Tungsten Deposits of Inyo County, Cal.

The demand for tungsten has recently led to an extremely energetic development of the tungsten deposits 8 miles west of Bishop, Inyo county, Cal. The deposits were discovered in 1913 but remained practically unknown until the spring of 1916. On April 7 the Standard Tungsten Co. began work. Trails and roads were built, ore bodies were opened up, a mill was erected and electric power was brought in. On June 7 the mill began to crush ore. The Tungsten Mines Co. started work on May 1 and by the later part of July had completed a mill of 300 tons daily capacity and was rapidly opening its main ore body, disclosing a lode as much as 60 ft. wide. This activity has greatly stimulated prospecting, and tungsten has been found in a belt 15 miles long.

The ore bodies, which have been visited by Adolph Knopf of the Survey, are remarkable and in fact are of a kind not mentioned by the recognized authorities on ore deposits as a commercial source of tungsten. The ore consists of scheelite associated mainly with garnet, epidote and quartz. The general country rock is granite, but in it are scattered masses of limestone which became mineralized at the time when the granite cooled from a molten condition. The limestones were altered to masses of garnet carrying subordinate scheelite by the metallic vapors then given off, and these are the ore bodies now worked. They average about 2% tungsten trioxide (WO_3). The deposits, like those recently discovered near Lovelock, Nev., belong to the so-called contact-metamorphic class, a well known source of copper but not heretofore recognized as a source of tungsten.

The fact that the tungsten-bearing mineral—scheelite—is associated with garnet is a great help to the prospector, and all bodies of garnet rock scattered through the great granite masses of the eastern Sierra slope bordering Owens valley are being carefully examined and panned for scheelite

Ferrous oxide (FeO) is a transitional product in the reduction of higher oxides and the oxidation of metallic iron. It is not known in the isolated state, owing to the readiness with which it combines to form higher oxides and salts. It is basic in character, forming easily fusible compounds with silica.

New Ore-Classifying Machine.

Selden I. Clawson, Salt Lake, Utah, describes in a recent patent an apparatus for classifying ore, in which the screens are cleansed with water, which is at the same time mixed with the material to assist in the process. The illustration shows a side elevation, the inclined screens being either rocked or revolved, according to type, by power supplied as shown. A system of piping carries water from the storage tank above to nozzles located above each screen. From

AN ORE CLASSIFYING MACHINE.

these nozzles the water is forced in jets onto the screens. In this patent are described a number of screens to cover all operating conditions. In one type, which rocks, partitions are arranged to retard the material in its passage. In another there is a screw which revolves and forces the material slowly along the length of the cylindrical screen. Underneath the screens are inclined troughs. Each trough collects material of a certain fineness and delivers it to a conveyor tube.

Fluxes are divided into three classes—acid, basic and neutral. Silica is the common acid flux. The basic fluxes are lime, magnesia, ferrous oxide, manganoous oxide and alumina, which is feebly basic. Fluorspar is a neutral flux.

Anode mud obtained in the electrolytic refining of copper is treated for the recovery of silver and gold.

Who Is Your Engineer?

By GLENVILLE A. COLLINS.*

When you attempt to present your project to the capitalist that is his first question.

Instead of being turned down at the outset, or told that your proposition was not presentable, why not start off on the right foot by having your proposition put in shape and thereby take no chances.

Many a fine mining proposition is going begging because it was not backed by a strong, honest, qualifying report signed by an engineer who knows and is known.

The engineer you want is the one who has a keen perception of real business as well as technical discernment. One who can state the case so concisely that there are no uncertainties left to qualify. One whose conception of principle is strictly ethical, unbiased and sound.

The engineer who writes a report on this basis needs no further qualifications. You can see his unquestioned reputation between each line.

There is unlimited capital for anything good. When you do not land your man do not blame him, but qualify your whole proposition by the report of an engineer who knows exactly how to present the matter in a masterful way.

Mr. Capitalist, Who Is Your Engineer?

When the gentleman with a proposition comes in asking for your help, why not ask him, Who is your engineer?

You owe it to yourself as protection. You may be very wise in business matters, but you do appreciate that a "mere detail," so-called, often determines the difference between success and failure.

A frequent question is, Can the bonds be sold? Many think the financier can answer, but after all it is the engineer who determines the point. The public qualify bond offerings these days and your best buyers consult their engineer.

Mr. Bond Buyer, Who Is Your Engineer?

Do you handle bond issues on properties that are not first analyzed by your own engineer?

How can you tell that the value is there and for how long? Why take the responsibility?

Bonds on any proposition indorsed by capable engineering advice are easier sold at better prices.

Mr. Mining Man, Who Is Your Engineer?

Did you ever sell a mine without an engineer's report, or did you ever operate one without technical advice?

The mine that pays dividends is one which manifests good engineering.

The man who says he has many worthless mining stock certificates never employed an engineer first.

Safety first in mining means to be guided first and all the time by a talented and reputable mining engineer.

Public utilities, mines and industrial propositions are in demand, also their securities.

The channels for trade are wide open, but the travel is light and the conveyances are few.

New Electric Hoists for Butte.

Two new electric hoists of exceptionally interesting design will be installed shortly at the Black Rock shaft of the Butte & Superior Copper Co., Ltd.

The main ore hoist as first built will have two drums each driven through axial plate clutches. Drums will be 9 ft. diameter by 7 ft. 6 in. face, designed to wind 3000 ft. of rope, in two layers, with a maximum rope pull of 41,000 lbs. Rope speed 2250 ft. per minute. These drums are so constructed that after reaching the 3000 ft. level, new drum shells can be applied converting the drums into 12 ft. diameter by 10 ft. face, after which they will wind 5000 ft. of rope in two layers with a maximum rope pull of 52,000 lbs. Rope speed 3000 ft. per minute.

The hoist is first motion driven by a D. C. motor receiving its energy from a flywheel motor generator set. While the 9-ft. drums are used the hoist will be driven by one 1000-hp. motor. When the change over is made and the 12-ft. drums are put in use, a second 1800-hp. motor will be added to the other end of the drum shaft, and the flywheel set will be doubled up.

The cage hoist is similar in construction to the ore hoist, having 8 ft. in diameter by 7 ft. face, designed to wind 5000 ft. of rope in three layers, with a maximum rope pull of 24,000 lbs.; rope speed 1650 ft. per minute. This hoist is geared through a single reduction of Wuest gears to a D. C. motor, receiving its energy from the motor-driven flywheel set.

Both hoists, which are of the Nordberg Mfg. Co.'s design, will be built with steel plate drums, Nordberg axial plate clutches, parallel motion post brakes, brake posts constructed of boilerplate built up. The brakes and clutches on both hoists will be operated by oil under pressure with the use of accumulators, receiving oil from motor-driven triplex pumps. Hoist bearings will be of the two part ring oiling type, and in addition will be oiled with a gravity oiling system. Control of the hoists will be the Westinghouse standard type for limiting the rate of acceleration and retardation, same to be put in operation by cams directly driven through gearing from each drum.

In addition to the electrical control a Welch safety stop will be supplied with each drum, which will take full control and stop the hoists, should electrical equipment fail. A further reason for applying Welch stops on these hoists was due to their practice of lowering one drum on the brakes frequently, under which condition, where no electrical energy is in use, electrical control would have no effect.

The first motion motors will be coupled to the hoist shaft with rigid flange coupling integral with the motor and hoist shafts. The cage hoist motor to be connected to the pinion shaft by a Francke flexible coupling.

*Mining Engineer, Seattle, Wash.

Chlorination Aided by Actinic Light.

In the chlorination of hydrocarbons such as gasoline, petroleum oils, benzol, toluol, etc., the action, in the absence of facilitating catalysts, depends largely upon the illumination. For some unknown reason, light causes chlorine to enter into substitutive reaction with the various hydrocarbons with the production of chlorine substitution products and HCl. But the trouble with the practical application of this fact is that the action is apt to be uncontrollable. It is, for example, very difficult to chlorinate any hydrocarbon, whether liquid or gaseous, to produce monochlor products (that is, products containing only one chlorine atom in the molecule) to the practical exclusion of di, tri, etc., compounds. Similarly, it is difficult to produce

CHLORINATION AIDED BY ACTINIC LIGHT.

the dichlor compounds to the exclusion of the higher chlorinated compounds. Further, it is often difficult to prevent the reaction becoming so violent as in some cases to lead to the deposition of carbon, or, in the presence of sufficient chlorine, to explosion. Direct chlorination is therefore not as much used as the value of the products which may be obtained thereby would warrant. For this reason, where halogen substitution products are wanted for chemical purposes as a rule, another halogen, bromine, is used and bromine compounds are made, bromination being less difficult to control than chlorination.

The exact nature of the action which light exerts upon chlorine, rendering it more prone to combination, is not known; but it is known that the rays of the spectrum which produce this action lie toward the ultra violet end; and it is also known that the rays

capable of activating chlorine are absorbed by chlorine. Taking advantage of these facts, Benjamin T. Brooks, Harry Essex and Dillon F. Smith, all of Pittsburgh, Pa., have devised a simple, cheap and ready method of controllably chlorinating liquid hydrocarbons and other liquid bodies capable of dissolving chlorine and of reacting therewith under the influence of light. This method they have patented and assigned to the Gulf Refining Co., Pittsburgh.

It may, for example, be used for converting liquid hydrocarbons into the monochlor derivatives, for converting the monochlor derivatives into dichlor derivatives, and so on. In this they simply irradiate one end of a body of liquid hydrocarbon or other liquid to be treated from a source of actinic rays, while introducing chlorine at the other end, and causing it, or the solution it produces in dissolving, to approach the illuminated end. In practice, the illuminated end of the body of liquid, for obvious reasons, is usually the top, while the chlorine is introduced as gas at the bottom. Presuming a body of gasolene, or a fraction obtained by distilling gasolene, to be chlorinated, the oil is placed in an opaque vessel having means for controllable illumination at its end; such means being, for example, a mercury vapor lamp, or a nitrogen-filled tungsten lamp. The lamp is best provided with a rheostat whereby the amount of light emitted may be controlled. At the bottom of the container they provide means for introducing gaseous chlorine.

The chlorine dissolving in the oil colors it yellow and as the chlorine disappears from the solution by reaction with the liquid, the color in the liquid also disappears. With this disappearance, the striking down or absorbing of active rays also disappears; that is, the rays pass through the uncolored oil but not through the colored.

The container as shown in the drawing is of enameled iron or stoneware. Through windows (2) the color of the liquid may be observed. A cooling coil is indicated by (5) and the lamp is shown at (6). A propellor agitates the liquid.

The gaseous matter is collected and cooled by worm (16), the liquids being discharged into a receiver where the aqueous hydrochloric acid and oily liquids separate into layers (19) and (20) respectively. The former is drawn off and the latter returned to the reaction vessel. Such portion of the vapors as is not condensed pass on into another worm shown at the right where the process is continued. A train of these cooling and washing devices is maintained, as many as necessary, for the completion of the process.

The equipment of a mine should be up to the requirements for economical operation to a capacity which prospecting and development work has assured, but to equip lavishly before that stage has been reached is the height of folly.

Clay is formed by the natural decomposition of rocks of the feldspar group.

What the Mining Companies are Doing

American Smelting & Refining.

Plans for the further enlargement of the Baltimore refinery of the American Smelting & Refining Co., now being perfected, will bring the capacity of this plant to 1,080,000 lbs. of copper a year. An addition to be begun immediately will add 5,000 tons a month to the output, at a cost of \$500,000.

An enlargement program at Baltimore now nearing completion will give the plant there capacity of 20,000 tons a month. This work is expected to be finished about close of this month. When undertaken the plant had capacity of about 13,000 tons a month.

Outside of Baltimore the American Smelting & Refining Co. has capacity to handle an equal amount of copper, or 480,000,000 lbs. a year. Enlargement of Tacoma plant has been completed and the plant is in full swing. Alaska ores, part of which for a time had to be sent to the Garfield, Mont., smelter, are now being handled at the Tacoma plant.

In view of prospective smelting and refining capacity of 1,080,000,000 lbs. next year it is interesting to note that when the smelting company entered the metal refining business in 1901 it had capacity of 60,000,000 lbs. yearly. Last year its capacity was 720,000,000 a year.

The construction and enlargement program still contemplates the expenditure of several million, but a considerable part will carry over into 1917. At the beginning of 1916 a program was outlined of \$6,000,000, but additions to this have since been made.

On the basis of business done by smelting in first 8 months of this year and outlook for the metal industry, it is expected that fully 30% will be earned on the \$50,100,000 common stock this year.

Alaska's Copper Shipments.

The Kennecott Copper Corporation is responsible for the position of Alaska as a copper producing section. Considerably more than 100,000,000 lbs. came to the United States from that territory in the 11 months to June 1.

Valued at \$23,203,510, there was shipped from Alaska 105,453,045 lbs. of copper in the period mentioned, against but 29,761,117 lbs. in the previous year.

Shipments from Alaska for a series of years have been as follows:

	1916.	1915.	1914.	1913.
January	9,365,733	2,149,476	2,784,802	1,668,328
February	10,913,458	3,678,889	1,859,360	660,250
March	10,992,707	2,149,272	2,133,980	472,293
April	12,992,523	2,845,980	1,319,110	1,730,252
May	12,405,421	3,525,690	603,492	1,771,508

As the Alaskan production of the Kennecott Copper Corporation has been approximately 10,000,000 lbs. monthly for some time, it would appear that the operations of the other shippers have not reached very large proportions.

American Zinc.

Upon the consummation of the merger of the Granby Mining & Smelting Co. into the American Zinc, Lead & Smelting Co., the latter will become the third largest individual factor in the zinc-smelting industry of the country.

Through subsidiaries the American Zinc, Lead & Smelting Co. already owns and operates three smelters having a total of 15,424 retorts. Through acquisition of the two smelters of the Granby Co. capacity will be increased to 22,404 retorts. Based on an average of 3½ tons of spelter per retort per annum this capacity would give the American Co. a yearly output of 78,414 tons—156,800,000 lbs.

This would be apportioned as below:

	Retorts.	Tons Spelter.
American Zinc Co., Illinois	4,864	17,024
American Zinc Co., Caney, Kan.	6,080	21,280
American Zinc Co., Deering, Kan.	4,480	15,680
Granby Co., Illinois	3,220	11,270
Granby Co., Kansas	3,760	13,160
Totals	22,404	78,414

Should an equitable basis be reached, another consideration, involving the American Co. and Butte & Superior Min-

ing Co., may take place later on, resulting in the largest zinc producing combination in the world. Butte & Superior already operates the largest zinc mine and the product from its mill now goes for treatment to the smelters of three different companies, as no one smelting corporation had sufficient capacity to handle the entire output of concentrates.

Con. Interstate-Callahan, Idaho.

The following statement has been issued at the close of the company's fiscal year, June 30, 1916:

	Tons.	Value.
Income—		
Lead ore	781	\$ 20,949.59
Zinc ore	9,498	611,271.60
Lead concentrates	3,723	128,414.57
Zinc concentrates	51,715	3,225,459.72
Totals	65,715	\$3,986,095.48
		27,076.34
Miscellaneous receipts		\$4,013,171.82
Expenditures—		
Mining and milling		\$ 727,164.35
Improvements		72,038.90
Operating and general expenses		113,477.29
Total		\$ 912,680.54
Surplus for year		\$3,100,491.28
Total accumulated surplus		\$4,061,640.66
Less dividends paid		3,254,930.00
Surplus June 30, 1916		\$ 806,710.66
Assets—		
Cash		\$ 143,573.46
Accounts receivable		46,596.68
Ore shipped		593,135.36
Ore on hand		3,153.58
Supplies on hand		55,112.01
Total		\$ 841,571.09
Liabilities—		
Mine vouchers payable		\$ 21,339.23
Mine wages payable		521.20
Taxes accrued		13,000.00
		\$ 34,860.43

Alaska's Low-Grade Gold Properties.

We are in receipt of the returns for the July operations of Alaska Treadwell, Alaska Mexican and Alaska United gold mining companies. We give figures below:

	Alaska Treadwell.	Alaska Mexican.	Alaska R. B. Claim.	United 700 Claim.
Tons ore crushed	77,721	14,385	23,660	21,350
Tons concentrate saved	1,752.12	390.11	572.67	358.58
Est. gross value of free gold	\$69,400.86	\$ 9,238.14	\$25,497.10	\$11,241.60
Est. gross value of concentrate	88,063.90	9,883.52	24,721.45	12,592.02
Est. tot. production	\$157,464.76	\$19,121.66	\$50,218.55	\$23,833.62
Est. total realizable value	155,890.12	18,930.45	49,716.37	23,595.29
Operating expenses	98,727.09	22,094.77	31,823.24	45,621.60
Est. operating profit	\$57,163.03	*\$ 3,164.32	\$17,893.13	*\$22,026.31
Construction expense	12,326.42	2,424.24	4,489.86	6,848.59
Est. net profit	\$44,836.61	*\$ 5,588.56	\$13,403.27	*\$28,874.90
Other income	11,281.00	3,730.00	†3,730.00	†.....
Yield per ton ore milled	2.03	1.33	2.12	1.12
	*Loss. †Total for Alaska United.			

Chile Copper Co.

According to estimates of officials Chile Copper Co. has now developed 351,130,660 tons of 2% ore, an increase of 50,000,000 tons, since April, 1915. Increases in developed ore have been as follows:

	Tons.	% copper.
August, 1916	354,130,660	2
April, 1915	303,330,789	2.23
April, 1913	85,657,000	2.41
December, 1912	75,000,000	2.70

The 2.23% ore as of April, 1915, was considered as 2% to allow for dilution due to waste material and other causes. This doubtless applies to the latest estimates of reserves. The Guggenheim interests, controlling the Chile Co., believe at least 500,000,000 tons will ultimately be developed. Fur-

ther plant enlargement to the contemplated capacity of 30,000 tons of ore per day will call for new financing. On the basis of treating 30,000 tons of ore per day, present ore reserves give the property a life of over 30 years.

La Salle Copper Co.

The La Salle Copper Co. has filed with the Massachusetts secretary of state a statement of its financial condition, dated May 31, 1916, which compares as follows:

Assets—	1916.	1915.
Real estate	\$6,414,595	\$4,773,092
Tecumseh Copper Co., property.....	1,849,120	2,139,886
Machinery and equipment	49,994
Merchandise, material, stock in process	126,524	2,620
Cash and debts receivable	48,266	104,868
Profit and loss	976,740	560,821
Totals	\$7,616,121	\$7,581,288
Liabilities—		
Capital stock	\$7,574,425	\$7,574,425
Accounts payable	31,696	6,863
Floating debt	10,000
Totals	\$7,616,121	\$7,581,288

August Copper Figures.

During August American copper producers generally increased production over the previous month. Production figures of some of the companies are given as follows:

	August.	July.
Miami	4,698,795	4,310,000
East Butte	1,849,120	1,893,120
Anaconda	28,800,000	28,200,000
Inspiration	11,450,000	11,300,000
Kennecott	10,200,000	10,750,000
Old Dominion	3,600,000	3,852,000
Greene-Cananea	5,000,000	4,700,000
Arizona Copper	4,800,000	4,400,000

Miscellaneous Companies.

The Kerr Lake Mining Co.'s August production of silver was 244,020 ozs.

The Schumacher Gold Mines, Ontario, reports for the 9 months ended with June 30, 1916, as follows: Tons milled, 30,120; operating cost, \$131,719.42; bullion produced, \$161,949; net profit, \$30,229.59.

The Tonopah Belmont Mining Co. reports for July as follows: Number dry tons milled, 11,828; ounces gold bullion produced, 2413.706; ounces silver bullion produced, 235,045.16; net profit for July, \$107,000.26.

The McIntyre Porcupine Mines, Ltd., reports for the quarter ended June 30, 1916, as follows: Tons milled, 30,452; gross value, \$252,530.35; recovery, \$241,650.05; operating costs, \$128,847.36; operating profits, \$112,802.69; from treating custom ore, \$9262.15; total, \$122,064.84.

The semi-annual report of the Chief Con. Mining Co. shows a balance on hand July 1, 1916, of \$381,589, compared with \$210,340 on Jan. 1, 1916. Two dividends were paid calling for \$88,282. In the 6 months shipments were 8,450,932 lbs. lead, 519,798 lbs. zinc, 1795 lbs. copper, 843,535 ozs. silver and 5225 ozs. gold, showing net profit of \$355,701.

The Tonopah Mining Co., in its report of net earnings for the month of July, shows that a profit of \$26,763 was made during that period. Though this amount is still far below normal, yet a substantial increase is shown over the earnings as reported for June, which were \$19,950. Operation resulted as follows: Dry tons milled, 8019; average value per ton, \$12.40; gold and silver bullion shipped, 111,565 ozs.; total value of bullion, \$94,485.

Despite the chaotic conditions in Mexico there is every reason to believe that the Greene-Cananea Co. will have a record-breaking year in 1916. The company rounded out the first half of the year with an output of close to 30,000,000 lbs. of copper, by all odds the best showing ever made in a similar period. The big improvement in condition in the vicinity of Cananea is shown by the fact that in the entire 1915 year the plant worked only 151 days and produced only 16,000,000 lbs. of copper. In 1914 the output amounted to about 21,800,000 lbs. Greene-Cananea has a normal capacity

of 60,000,000 lbs. a year, although in March, April and May the property showed its ability to better this rate, with the result that below-normal output in January and June was wholly offset. Costs have recently been averaging about 11 cts. per pound, which with a 60,000,000-lb. output and a 25-ct. copper market would produce net of \$8,400,000 per annum, or \$18 per share on 474,100 shares outstanding. Barring some unforeseen contingency, therefore, there seems every reason to expect at least a continuance of Greene's present dividends of \$8 per share per annum.

The Kennecott Copper Corporation has declared its regular quarterly dividend of \$1.50 a share, payable Sept. 30 to stock of record Sept. 18. Three months ago \$1.50 was declared; initial dividend of \$1 was declared 6 months ago. After the Kennecott meeting the following statement was issued: "At this meeting a statement was submitted showing cash, short time notes and copper on hand, all of which copper has been sold, amounting to \$22,058,000, but this does not include Kennecott's interest in cash and copper on hand of Braden Copper Mines Co. or Utah Copper Co."

After the payment of dividends on Sept. 30 of \$6.25 a share the Butte & Superior Mining Co. will have approximately \$2,000,000 cash in its treasury. Quick assets should approximate \$5,000,000. The company now has outstanding 299,197 shares, of which 17,500 were recently issued for 35,000 shares of common stock of the American Zinc, Lead & Smelting Co. For the current quarter alone the advanced rate of \$1.25 and extra of \$5 will necessitate the disbursement of \$1,813,731. Three months ago the 75-ct. "regular" and \$10 "extra" called for \$2,931,293 on 272,697 shares. Butte & Superior's output in August was 34,000 tons of ore producing 10,500,000 lbs. of zinc from 9600 tons of concentrates. Silver production was 200,000 ozs.

There is every reason to expect that the Nevada Con. Copper Co. will produce at least 50,000,000 lbs. of copper during the last half of this year. During the first half 43,000,000 lbs. was produced. Earnings during the first half netted \$7,500,000, or \$3.75 per share on its 2,000,000 shares. With copper at 25 cts. per pound and above, coupled with Nevada's recently proved ability to speed up production to the present rate of 100,000,000 lbs. per annum, has caused a revision upward in estimates of the value of its shares. Of equal importance was the addition in the 1915 year of 9,500,000 tons to the company's ore reserves, bringing them up to 50,500,000 tons, the highest on record, notwithstanding that in that year ore mined also touched a new high mark.

The Ohio Copper Mining Co. stockholders' meeting, to be held in New York Sept. 15, is expected to result in plans being formulated for the rehabilitation of the company. The Ohio Copper Mining Co. was adjudicated a bankrupt in September, 1915. The mortgage of the company securing the issue of bonds to the extent of about \$1,242,000 was foreclosed upon a default of about 6 months' interest. The property was sold at public sale under the decree of foreclosure on Aug. 30 last at Salt Lake City, Utah, and purchased by the bondholders' committee for \$750,000. The right to redeem the property was also purchased by the bondholders' committee for \$40,000, but an order has been obtained from the Federal court staying the confirmation of the sale until Oct. 13.

There was produced by the Chile Copper Co. during the first half of this year a total of 19,724,385 lbs. of copper. These figures are the first of their kind to be published concerning this company. It has been decided by the management to issue monthly reports of production hereafter. In carrying out the proposed plan for enlargement of the plant new financing will probably have to be arranged. No decision has actually been reached as to the form of new securities to issue, although \$10,000,000 has been mentioned as the amount to be raised. Up to the end of last August there had been spent on construction and equipment \$13,000,000, since which time no financial statement has been made public. The company has outstanding \$95,000,000 capital stock, and \$15,000,000 convertible 10-year 7% bonds. The floating debt last August was about \$5,000,000. Plans of the management call for a plant which will eventually handle 30,000 tons of ore daily.

August Copper Figures.

It was generally expected that copper production in August would show an increase over the record production in May when 190,000,000 lbs. was out-putted. Production, however, fell below 160,000,000, due to various causes.

Not only were refinery operations cut down, but production at smelters was retarded largely on account of slow deliveries of equipment, chiefly electrical machinery. This was reflected in smaller shipments of blister product to the refining points. Not much before the end of October do producers look for much improvement or an increase in marketable copper.

While negotiations for a big tonnage of copper to be shipped to the allied governments during the first half of 1917 came to naught during the past week, it did not prevent the placing of further orders for foreign account for metal to be shipped to individual manufacturers abroad. It also came to light that there has been a large buying movement for finished material, of which copper is a base, against which domestic manufacturers either have already or must soon lay in supplies of raw material.

That the 1917 production will be well cared for as to demand and price is the opinion of a representative of one of the largest agencies in the country who claims that domestic and foreign consumers will take all the increased 1917 copper production at 27 cts. a pound and higher. He continues:

"Sales are now being negotiated for a heavy tonnage of the first quarter of 1917 metal at prices ranging from 27¼ to 27¾ cts. a pound, the exact price hinging on the delivery month. From present indications it appears that contracts shortly will be placed for the biggest part of the copper available for delivery before July at better than 27 cts. a pound."

Large dealers and sellers generally are sanguine over the outlook, agreeing that all copper available for this year's delivery soon will be eliminated from the market.

Record Payroll for Butte.

With the average price of copper for August above 25 cts. Butte miners will enjoy a \$4.50 a day wage scale, which will result in their receiving a total of \$2,350,000, the largest amount ever paid to the miners of that camp.

August, with 31 days and only four of them Sundays, will show the largest number of shifts ever worked in the mines of the Anaconda. While the exact amount of the payrolls has not been determined, very close estimates have been given out.

The estimate of the mine payroll of the Anaconda Co. alone is \$1,630,000. The July roll was \$1,520,-

500. This shows an increase of over \$100,000 for this company alone.

The increase in Anaconda and Great Falls at the smelters and reduction plants will also amount to a large sum. The Anaconda rolls of the company are estimated at \$606,400 as compared with \$587,100 for July. At Great Falls the company's payrolls for August will be approximately \$280,750. The July payrolls there were \$290,400. The decrease was due to the completion of construction work.

The Butte & Superior Co. will pay about \$230,000 for August, compared with \$258,000 in July. The decrease was due to the 10-day shutdown—the result of an accident in the shaft.

The East Butte Co. payrolls for August will exceed \$130,000 as against \$128,000 in July.

The North Butte payrolls for August will be close to \$165,000 as against \$144,335 in July, an increase of over \$20,000 and almost alone making up for the decrease in the Butte and Superior rolls.

The Elm Orlu Co. will pay for August about \$40,000 and the Timber Butte Co. about \$30,000, or a total for these two Clark companies of \$70,000, as against about \$65,000 in July.

The payrolls of the Davis-Daly, Tuolumne, Colusa, Leonard, Butte Great Falls, Butte & London, Butte & Zenith City, Greater Butte and other companies, will add over \$100,000 more to the mine payrolls of Butte.

The mining industry alone will pay out in Butte \$2,350,000. The payrolls of Anaconda and Great Falls in the mining industry will add \$900,000 more to it, making a total for the mining industry alone of \$3,250,000.

Placer Mining of Today.

Placer mining in the pioneer days of the west meant rich deposits contained in limited areas, usually a narrow gulch, presumably close to the source. Values were sufficiently high in coarse gold to make a good return even with the primitive methods at that time. This was what might be termed the "cream of mining," and was the source of many stories of romance and crime; also the foundation of a large number of fortunes. It, however, peopled the west and was the basis of an industry which has added billions to the world's wealth.

Time came, however, when values would not return a profit by hand work, or even by the later hydraulic methods, and mechanical effort as represented by dredging, was successfully developed. This development neglected one class of deposits, however—the shallow, moderate value placers, too lean for hand work, without dump or water (either or both) for hydraulic work, and, out of consideration for dredging, frequently containing black-sand, values which must be recovered to make operation profitable and quite as often carrying values in fine gold not

recoverable by well-known methods. Their shallowness and usual location makes dredging out of the question, so that all told a problem was apparent, but it is only within very recent years that this has been recognized, or that satisfactory results have been obtained in solving it. One of the most potent causes of this situation is failure due to lack of realization of conditions as shown by the continued fruitless attempts to apply the early methods, apparently forgetting that they were inefficient even when financially successful. Either this, or the worst sort of negligence in the preliminary investigation, and there is ample evidence to show that this has been often the trouble. There is something wrong when a method will be duplicated on ground in the same region after the first has most signally failed.

With very excellent results as encouragement, it is surprising that some lessons have not been learned earlier from the development of milling methods. Placers are in substance deposits of free metal on which the crushing and grinding has been done by nature's efforts, leaving concentration and recovery as the necessities to make a realization.

With its quarterly dividend payment of \$20 per share Sept. 22, the Calumet & Hecla Mining Co. will have paid already in 1916 \$5,000,000. Since its first dividend in 1892 this company has distributed among shareholders the enormous sum of \$134,250,000, or \$1342.50 per share, a return equivalent to approximately 1970%. The company has not missed a year in paying dividends, the largest year's total being in 1899 when \$100 per share was paid. The smallest was in 1894, when a total of \$15 per share was paid.

One of the achievements of American chemistry, to be demonstrated at the forthcoming Chemical Exposition to be held in New York, is the manufacture of porcelains by American pottery manufacturers. Heretofore our supply of porcelain was largely furnished by Germany, but with the outbreak of the war this source was cut off, and it was up to American chemists to get busy. This they have done with the result that the manufacturers are turning out a product fully equal to that of any produced in Germany.

An interesting compilation has been published showing the source of revenue (dollars) of American railroads. The mines are credited with contributing the greatest amount, 23.86 cts. Passenger traffic is next largest with 22.20 cts. Other income is given as follows: Manufacturers, 15.10 cts.; agriculture, 11.72 cts.; forest, 7 cts.; merchandise, 4.32 cts.; animals, 4.15 cts.; miscellaneous freight, 3.32 cts.; miscellaneous passenger, 3.99 cts.; express, 2.37 cts.; mail, 1.97 cts.

From Montana comes a report that a campaign will be instituted soon by the United Mine Workers of America for a national shorter workday, either for 7 or 8 hours from "bank to bank," that is, from the time the men enter a mine until they emerge.

PERSONAL.

Captain Jas. Hoatson of Calumet, Mich., is in Chicago this week.

A. H. Gracey, former mine operator of Nelson, B. C., is now in Kingman, Ariz.

A. E. Drucker, consulting engineer, formerly of London, has removed to New York.

Norman C. Stines, mining engineer, will remain in Polevskoj, Siberia, for another 3 years.

J. C. Bjorn, superintendent of the Copper Giant Co., Clarks Fork, Idaho, is in Chicago.

Frank L. Sizer, superintendent of the Mascot Copper Co., Dos Cabezas, Ariz., is in Butte, Mont.

B. L. Thane will remain as general manager of the Alaska Gastineau Mining Co., Juneau, Alaska.

Nelson Dickerman, general manager of the Pato Mines, Ltd., Barranquilla, Colombia, is now in Bolivia.

A. P. Coleman, University of Toronto, Ont., is now making professional investigations on the coast of Labrador.

Harry Guess, consulting engineer for the American Smelting & Refining Co., New York, is in Spokane, Wash.

A. S. Ross, president of the Pittsburgh-Idaho Co., Salt Lake City, has been visiting the property at Gilmore, Idaho.

F. J. Longworth, superintendent of the British Columbia Copper Co., Greenwood, B. C., has returned from Colville, Wash.

Walter Barrows, Jr., iron mine operator, Brainerd, Minn., has been elected president of the Thomas Iron Co., Easton, Pa.

F. O. Williamson, mining engineer, dealing in machinery, Chicago, has left for a tour of the west. He will be gone 3 months.

George W. Evans, consulting mining engineer, Seattle, Wash., is visiting eastern cities and on returning will leave for Alaska.

S. D. McDonald, owner of a large zinc property at Danby, Cal., is in Los Angeles on business connected with his property.

Chas. J. Walker, St. Louis, secretary and treasurer of Down Town Mines Co., Leadville, Colo., was at the latter place recently.

George B. Holderer, recent manager of the Furlough Development Co., Arizona, is now with the General Chemical Co., New York.

Charles Hayden and D. C. Jackling have completed inspecting the Alaska Gold Mines Co.'s property and have left for Seattle, Wash.

C. T. Lupton has resigned from the U. S. Geological Survey to accept a position as geologist with the Cosden Oil & Gas Co., Tulsa, Okla.

M. H. Kuryla is in charge of construction of the electrolytic zinc plant being built at Park City, Utah, by the Judge Mining & Smelting Co.

H. B. Sharps, assistant manager of the Big Casino property near Searchlight, Nev., is now in Philadelphia on business connected with that company.

F. B. Miller, Jr., of Searchlight, Nev., is at the Clarkdale smelter of the United Verde Co. arranging for the reduction of the copper ores now being produced by the Quartette mine.

S. G. Lilja, engineer with Hamilton & Hansell, Stockholm, Sweden, has returned from a trip to this country, where he was examining electric furnaces.

W. G. Miller and T. F. Sutherland of the Ontario Nickel Commission are in Sydney, Australia, and will return to Toronto, Ont., some time in October.

W. H. Eardley, general manager of the U. S. Smelting & Refining Co., in Kansas, has been in Salt Lake City, Utah, from his headquarters at Kansas City.

W. S. Grether, mining engineer with the Butte & Superior Mining Co., Butte, Mont., is superintending operations of the Hudson Bay mine, Salmo, B. C.

Samuel H. Dolbear, consulting engineer, San Francisco, has returned from a trip to New York and Washington, D. C., and is now at Grants Pass, Ore.

Ivan P. Tashof, instructor in mining at the University of Kentucky, has resigned and will locate with Byrnes, Townsend & Brickenstein, Washington, D. C.

Walter M. Brown, E. M., of Searchlight, Nev., is now in New York on business connected with the Dupont Copper Mining Co., of which he is the manager.

W. W. Wishon of Los Angeles has returned from an extended trip covering 2½ months through northern Nevada and central California on professional business.

Rod. Leggatt, one of the oldest of the old-time prosperous mining men of Butte, Mont., was a Chicago visitor this week. Although in his 77th year, Mr. Leggatt is unusually active and enjoys life to the utmost.

Rowland King, graduate of the Michigan School of Mines, has accepted the appointment of general superintendent of the mine and mill of the Highland Mining and Development Co., near Ashcroft, B. C.

Alexander Leggatt, who graduated with honors from the Michigan School of Mines, Houghton, Mich., and who has recently settled down as host at the Leggatt Hotel, Butte, Mont., was in Chicago this week.

William Scallon, at one time president of the Anaconda Copper Co., now a prosperous mining attorney at Helena, Mont., stopped off in Chicago, returning from a visit with a brother in Hancock, Mich., this week.

Matt W. Anderson left this week for Honduras, Central America, to make examination of a large placer property. He will be absent several months and during this time his address will be Catacamas, Honduras, Central America.

OBITUARY.

George W. Riter, mining engineer, Salt Lake City, Utah, died in that city on Aug. 20, 1916. He was born on Feb. 22, 1870, in Salt Lake. He was a member of the American Mining Congress, and an officer of the Utah Section of the American Institute of Mining Engineers. He attended the University of Utah and was graduated from the Stanford University, California, in 1896. He was secretary of the Eureka Hill Mining Co. for some years after graduation; was city engineer of Salt Lake from 1904 to 1906.

Edgar Dewdney died of heart failure Aug. 8, 1916, at his home in Victoria, B. C. He was 81 years old and was born in Devonshire, England. He received the degree of civil engineer from an English college and came almost immediately to British Columbia, this occurring about 1860, with the big excitement of the gold finds in the Cariboo district. He spent most of his life in the province and during his earlier years made trails through to some of the more important camps of the province. Among the more prominent companies with which he was affiliated is the Britannia Mining & Smelting Co.

SCHOOLS AND SOCIETIES.

Iron and Steel Institute, Great Britain.—The autumn meeting of the Institute will be held at the Institution of Civil Engineers, London, Sept. 21 and 22, 1916. The following papers will be submitted:

H. Brearly: "Some Properties of Ingots."

Professor E. D. Campbell: "Influence of Heat Treatment on the Thermo-Electric Properties and Specific Resistance of Carbon Steels."

Dr. H. M. Howe and A. G. Levy: "Heat Treatment of Eutectoid Carbon Steels."

J. N. Kilby: "Steel Ingot Defects."

Herbert K. Scott: "Manganese Ores of the Bukowina, Austria."

Dr. J. E. Stead, F. R. S.: "Influence of Elements on the Properties of Steel."

Dr. J. E. Stead, F. R. S.: "Notes on (a) Nickel Steel Scale. (b) On the Reduction of Solid Nickel and Copper Oxides by Solid Iron. (c) On Effect of Blast Furnace Gases on Wrought Iron."

G. F. Zimmer: "Use of Meteoric Iron by Primitive Man."

Iron and Steel Electric Engineers.—Central station power for steel mills, the operation of the Heroult electric furnace, the electric reversing blooming mill and portable electric tools in the iron and steel industry are among the subjects to be discussed at the coming annual meeting of the Association of Iron and Steel Electric Engineers, to be held at the Hotel La Salle, Chicago, Sept. 18 to 22, inclusive. Following a business session on Monday morning, Sept. 18, there are to be afternoon and morning technical sessions and plant visitations as follows:

Sept. 18, 2 p. m.: "The Value of Records to an Operating Engineer," by Ray S. Huey and "Cost Versus Upkeep of Direct-Current Motors," by A. M. MacCutcheon.

Sept. 19, 9:30 a. m.: "Central Station Power for Steel Mills," by the Central Station Power Committee, and "Design of Structures for Steel Mills," by Charles A. Randorf. Arrangements have been made to visit the power stations of the Commonwealth Edison Co. in the afternoon.

Sept. 20, 9:30 a. m. (joint session with American Institute of Electric Engineers): "Underground Distribution Systems," by George J. Newton, and "The Unaflo Engine," by Prof. W. Trinks. 2 p. m.: "Steel Conductors for Transmission Lines," by H. B. Dwight, and "The Advantages of Modern Types of Direct-Current Machines," by David Hall. 7 p. m.: Annual banquet and ball.

Sept. 21, 9:30 a. m.: "Mechanical and Electric Operation of the Heroult Electric Arc Furnace," by George W. Richardson, electrical superintendent American Bridge Co., Pensoyd, Pa., and "Operating Characteristics of an Electric Reversing Blooming Mill," by E. S. Jeffries, 2 p. m.: "Control of D-C and A-C Motors as Applied to Cranes," by Paul Caldwell, General Electric Co., Pittsburgh, and "Portable Electric Tools as Applied to the Iron and Steel Industry," by A. M. Andresen.

Sept. 22: Arrangements have been made to inspect the following steel plants: Illinois Steel Co. at Gary and South Chicago; American Sheet & Tin Plate Co. at Gary; Wisconsin Steel Co. at South Chicago, and Inland Steel Co. at Indiana Harbor.

pages of the report are on the mining and metallurgy of the metal with a small space given to discussing the metal's uses.

Petroleum Withdrawals and Restorations Affecting the Public Domain. Max W. Ball. Washington, D. C., U. S. Geological Survey. Bulletin 623; pp. 427.

The purpose and history of withdrawals is given, with a review of oil-land law. The correspondence relative to withdrawals and restorations is reproduced and precise information is given on the location of areas which have been both withdrawn and restored.

Coeur d'Alene Mining Information. By William Wagner. William Wagner, Wallace, Idaho. Book; pp. 174. For sale by Mining World Co. \$4.

For the greater part the book is a complete index of the companies operating in the district. In taking up each company separately the principal place of business, officers, owners and a brief description of the holdings and mine workings are given. Shipments made, but not showing the profits made, are given for some of the companies, while under another heading, including four pages, costs and financial statements of some of the companies are given.

A Study of the Inductance of Four-Terminal Resistance Standards. By Francis B. Silsbee. Washington, D. C., U. S. Bureau of Standards. Scientific Paper No. 281; pp. 52; illustrated.

The paper deals with the inductance of electrical resistance of less than 1 ohm. New methods of measuring alternate current require small resistances in the laboratory tests. Even very small errors in a standard would introduce serious errors in resulting measurements. This represents an important and practical contribution to precision measurements.

The Alaskan Mining Industry in 1915. By Alfred H. Brooks. Washington, D. C., U. S. Geological Survey. Bulletin 642-A; pp. 71.

This is the twelfth of a series of annual bulletins summarizing the results and important economic findings made during the year. Gold, silver, copper, tin, antimony, lead and mineral fuels are reviewed under separate headings. Separate reviews of the different districts are also given and a complete account of the law controlling coal mine and lands leasing is taken up. Inclusions of production statistics are made in various parts of the report.

Antimony Deposits of Alaska. By Alfred H. Brooks. Washington, D. C., U. S. Geological Survey. Bulletin 649; pp. 67; illustrated.

With the increasing demand for antimony this bulletin has been published and is not the result of field-examination entirely, but rather a bringing together of information from various sources. The presence of stibnite is known in 67 localities in Alaska and the first part of the bulletin deals in general with the geology of stibnite lodes. This is followed by more detailed descriptions of the districts, taken separately, among which the most important is the Fairbanks district. The information on this district was mostly obtained from recent investigation by the author.

Volume Effect in Silver Voltmeter. By E. B. Rosa and G. W. Vinal. Washington, D. C., U. S. Bureau of Standards. Scientific Paper No. 283; pp. 11; illustrated.

This paper is a continuation of the Bureau's researches on the silver voltmeter, which is the primary standard for the measurement of the international ampere. It has been found that when the electrolyte for the voltmeter is not sufficiently pure that the deposits in the large voltmeters are in excess of those in the small voltmeters in series with them. This phenomenon has been called the "volume effect." The present paper shows that this effect is due to the impurities of the electrolyte and not to other causes, as was thought by several previous observers. It is also shown that the effect is the same in all forms of the silver voltmeter which the Bureau has tested. A theory to account for the effect is given. This phenomenon affords a valuable criterion of the purity of the electrolyte used in the voltmeter.

NEW PUBLICATIONS.

Platinum and Allied Metals in 1915. By James M. Hill. Washington, D. C., U. S. Geological Survey. Mineral Resources of U. S. 1:6; pp. 19.

Production, imports, market conditions and prices make up the material for the first part of the report and covers United States and foreign countries in general. Brief descriptions and notes are then given on different mines of the world. For foreign countries these are classified by the country in which the mine is located, while in the United States the classification is made by states. The concluding

Progress Made in the Manufacturing Industries

A Hyatt Departure.

The time is fast coming when all through the industrial world the truth of the anti-friction proposition will be accepted, just as it has been accepted by the automobile builder. Mine operators in particular are realizing that haulage is fast becoming one of the most important problems that confronts them today. Old methods are giving way to new methods. Anti-friction bearings are getting the operator's attention, because they not only make an easier pushing or pulling of the mine car, but decrease oil and maintenance cost. Certainty of operation is also a big factor with a piece of machinery as well as meaning a great deal to the mine operator. Good anti-friction roller bearings have been tested under the most severe conditions—by far beyond ordinary practice—and they have stood up every time. To meet the conditions that will result from the above knowledge the Hyatt Roller Bearing Co. has changed its Commercial Sales Division to the Industrial Department, to be located at the company's factory in Newark, N. J. This change will result in the better handling of the company's increasing business.

TRADE PUBLICATIONS.

Pelton-Doble Centrifugal Pumps. The Pelton Water Wheel Co., San Francisco. Bulletin No. 9; pp. 6; illustrated.

In the text of the bulletin the construction, uses, applicability and features of the pump are brought out. Among these things are noted the uni-diffusion of the volute which it is stated makes possible a high efficiency. Another feature is the pump's over-hung pulley system, which is referred to as a convenience, together with the fact that the belt and direct connected types are interchangeable. In this way it is said that the pump can be belt-driven before electric power is installed and later connected to a motor for direct drive by removing the belt pulley and replacing it with half of a flexible coupling.

Burd Piston Ring Directory. Burd High Compression Ring Co., Rockford, Ill. Directory; pp. 180. Price 50 cts.

All the different makes of gasoline engines and appliances using engines have been assembled in this directory in tabulated form. In this column have been made in which the year, make, model, rings per piston and number of cylinders are given. This tabulated data are completely indexed in alphabetical order according to the name of the engine maker or machine using a gasoline engine, including trucks, automobiles, separate engines for mine and plant duty, etc. In the concluding pages a review with diagrams is made showing how to install rings and explaining various other phenomena apt to be encountered.

Centrifugal Pumps. Terry Steam Turbine Co., Hartford, Conn. Bulletin 19; pp. 64; illustrated.

As a foreword it is stated by the company that the purpose of this bulletin is to set forth as impartially as possible the advantages and limitations of turbine-driven centrifugal pumps. In view of serving as a text on centrifugal pump design, operation and practice, the bulletin has filled its place as well as possible, for considerable unbiased information on this class of pumping practice and design is given. The Terry pumps are shown in sectional drawings, views and illustrations of plant installations. The use of centrifugal pumps for various classes of work is discussed separately for the different classes. Complete layouts for pumping systems and plants using turbine-driven centrifugal pumps are shown.

The Belt Book. By A. Eugene Michel. Cling-Surface Co., Chicago. Book; pp. 92; illustrated. Price \$1.

A treatise on the scientific care of belts, transmission ropes, etc., is the subject on which the text dwells. The book is a trade publication only in that where belt dressings, etc.,

are spoken of products of the Cling-Surface Co. are mentioned. Many illustrations are shown of installations in connection with the text. Curves on which the results of tests have been plotted are reproduced and diagrams are given to clearly bring out correct practice and the reason for preference to various particular methods. Tests made to show the results obtainable with Cling-Surface treatment are reviewed and in all cases specific data are given. Besides this simple methods which may be used for testing in a practical way at the plant are described.

INDUSTRIAL AND TRADE NOTES.

H. V. Croll, sales engineer for Traylor Engineering & Manufacturing Co., Allentown, Pa., recently visited San Francisco, stopping at Salt Lake en route east.

A Jeffery Quad truck of 2½ tons capacity, together with a 5-ton trailer, have been received by the Judge Mining & Smelting Co. to haul gravel to its new zinc plant at Park City, Utah. They will be used later for hauling ore, as it is thought that they can be run all winter.

On account of change from steam to electricity, the steam power plant of the AV plant of the American Smelting & Refining Co., at Leadville, has been purchased by the Morse Bros. Machinery & Supply Co., of Denver, Colo., and will be removed to their Denver warehouse for resale.

The Cutler-Hammer Mfg. Co., Milwaukee, owing to its steadily increasing Eastern business, has leased larger offices in New York city. The new offices are on the nineteenth floor of the Hudson Terminal, 50 Church street, the space being nearly double that previously occupied. W. C. Stevens is manager of this office.

The Crocker-Wheeler Co., Ampere, N. J., announces that its San Francisco district office, of which W. K. Brown is manager, has been removed from the Crossley building, 619 Mission street, to the ground floor of 87 New Montgomery street. A large assortment of motors, generators and transformers will be carried in stock for the convenience of Pacific coast buyers of electric equipment.

The General Testing Laboratory has been organized to do a general chemical and physical testing and metallurgical investigation business with offices and laboratory at 1122 Grand avenue, Kansas City. Their newly equipped laboratory is in charge of and under the personal supervision of A. C. Lyon, B. S. Ch. E., who was for ten years chief chemist and vice-president of the Kansas City Testing Laboratory Co. of Kansas City. Previous to this Mr. Lyon was with the Carnegie Steel Co., expert chemist of the War Department, and instructor in chemistry, University of Missouri. The new company is prepared to test and analyze asphalt, cement, metals, alloys, coal, paints, and dgeneral physical tests.

An order for the electrical equipment for a big new mill and two sub-stations of the Alaska Juneau Gold Mining Co. at Juneau, Alaska, has recently been received by the Westinghouse Electric & Mfg. Co. of East Pittsburgh, Pa. The order, which covers every piece of electrical apparatus required for all operations from the time the ore is taken out of the mine to its transition into pure gold, includes: Two, 300 kw. rotary converters with transformers; two 18-ton tandem locomotives; two 400-hp., thirteen 225-hp. and thirteen 150-hp. induction motors; two 350-hp. synchronous motors and exciters, two 300 kva., synchronous motors; fifteen smaller motors; one 100-kw. motor-generator set, and a 17-panel switchboard. The order represents the equipment for only a first section of a mill. When complete the mill will be four times its present size and will be the largest, most complete, and most modern installation anywhere in America.

Late News From the World's Mining Camps

Editorial and Special Correspondence.

ALASKA.

Skagway.

Under Supt. J. E. McFarland a force of 14 men are working at the Venus mine. Promising shipments have been made. Under the present working conditions McFarland reports that shipments will be made at least every 2 weeks. The miners are working stopes from the main tunnel, which has been drifted in 2000 ft. Present plans call for the installation of modern machinery. At present the ore is shipped in sacks, but later it will be possible to ship in bulk.

Seward.

The Reynolds-Alaska Corporation has been incorporated in Alaska with 1,000,000 shares and no par value. The stock is all treasury and is being sold at \$5 per share in blocks of 20 shares or more. The corporation can engage in any form of enterprise except banking. At present the company will acquire developed and partially developed property under perpetual lease, with the royalty not to exceed 15%. The properties are the Iron Mountain mine, Horseshoe Bay and the Wilson-Little mine, Wilson Bay, both on Latouche island. The Sulphide gulch and Trout bay mines, also under the same control, are included in this lease. Copper-sulphide ores now blocked out on the several properties are estimated at 800,000 tons. At present the company proposes to raise \$250,000 from the sale of stock. This will be used to erect a pyritic smelter near Seward. It also intends to make application for coal lease in the Matanuska field and mine its own fuel. The coal can be brought from this field over the new government railroad.

Nome.

The Pioneer Mining Co. has cleaned its hydraulic elevators at the Fox-Brown claim on Kattie creek, and announced the total at \$200,000. Five elevators are working full time, and work will be begun at once on the Fox-Portland benches.

The cleanup on J. C. Brown's discovery claim on Little creek yielded \$200,000 in gold. Machinery has been installed and the old workings are being mined over again. It has been reported that there is plenty of water in the district this season and that operations are extensive.

Ketchikan.

At the Goodrow mine near Kasaan work is progressing. S. J. Goodrow states that at his place 10 men are employed, or will be as soon as he can secure that number. A survey of a water power has been made, and the owners have made plans to install a mill soon. The last 30 days over 900 tons of good ore have been shipped and he has several hundred tons more to ship from the present level. This must be accomplished before another machine can be put in to work with advantage.

ARIZONA.

Bisbee.

As a result of churn drilling, which has been in progress for some time, a large ore reserve has been blocked out by the Copper Queen on Sacramento hill. The tonnage estimate is from 9,000,000 to 12,000,000. A new 2500-ton concentrator is being considered. For mining four systems have so far been considered. Top sluicing has been in use at the Czar and is very practicable in the mining of big high-grade ore bodies. This method is also used at Miami. Another method which has been considered is the shrinkage caving

system, in use at Ray. The Inspiration system breaks the ore from inclined raises into chutes. The raises extended like the branches of a tree into a body of ore and the rapidity with which ore may be taken out accounts for the large production of the Inspiration Co. Last is the steam shovel method. There is a considerable overburden which must be removed from the ore bodies, and another drawback is the irregularity of the bodies.

Globe.

Superior & Boston is down with its shaft about 60 ft. from the 12th level and is progressing with the sinking at the rate of 75 to 100 ft. a month, through diabase; its goal is, of course, the 14th level. As all of its neighbors to the east—its operations being next to its eastern boundary—the Arizona Commercial, Iron Cap or National, and the Copper Hill are taking out ore at a good profit at the 14th level or higher, there seems not to be any doubt but that the Superior & Boston will run into it in its descent. The Arizona Commercial is said on good authority to be earning at the rate of \$60,000 monthly and the Iron Cap's profits will run to \$25,000 to \$30,000 for the same period. The New York buying a short time back, which originated with some New York parties who visited Globe and inspected this mine, has been continuing, and it comes from a reliable source, that some of the Phelps & Dodge people have been among the purchasers.

Mayer.

The Silver Belt mine, one of the oldest properties in Yavapai county, is shipping ore to the plant of the Gray Eagle Reduction Co. at Mayer. In fact, the Silver Belt mine was the first patron of that recently established reduction works. The ore shipped is complex and runs about \$25—principal values being lead, silver and zinc. The large tonnage of ore on the old dumps at the Silver Belt is first to be marketed.

Sheelite ore having a value of \$340 per ton, exclusive of silver and gold contents, was recently discovered in the Flora mine in the Hassayampa country. The find was made in the face of a 200-foot tunnel and is said to present unmistakable indications of permanency. This tunnel is to be extended 200 ft. further into the hill, where it will have a depth from surface of 300 ft. on the vein. The owners of the Flora, Valentine Albarrado, John Bernard and Louis Bernard, have been working the property for the past two years as a silver proposition with considerable success. It is located near the old Mescal millsite, about 10 miles south of Prescott.

Crown King.

Colorado Springs capital is interested in the development of the property of the Montezuma Mining Co. in the Bradshaw mountains, near here. The acreage has an excellent mineral-showing, and the Coloradoans have supplied sufficient money to open it at depth and to provide the necessary mine machinery. A camp is being established and a dozen camp buildings are under construction. J. P. Waldron, a former Colorado mining man, is in charge of the company's affairs. The Montezuma property had been undergoing development for 8 years before the present outfit became identified with it, and during that time large and valuable silver-gold ore bodies were opened up. These ore bodies, aside from their precious metal contents, carry pay values in lead and zinc. Among the improvements the management has in view is a reduction plant. David Gemmill of the Randolph-Gemmill Reduction Works at Crown King has solved a treatment by flotation for the base ores of that section and is utilizing it with success at his plant.

The Gemmill improvement to the oil-flotation process has, more than any other single factor, been instrumental in the renewal of mining operations in the Bradshaw moun-

tains. High-grade ore has in the past been the rule rather than the exception in the mines throughout the Bradshaws, and now that a treatment adapted to the sulphide ores disclosed on their lower levels has been evolved, many of the old-time producers are again on the active list. Among them are the Crown King, Wildflower, Fairview, Nelson, Lincoln, Tiger Gold, Tiger Silver and War Eagle-Gladiator. During the heyday of their prosperity these and other mines in the Bradshaws produced ore carrying from \$250 to \$1000 per ton in silver and gold.

A camp has been established at Hell Hole by the Algonkian Mines Co., a corporation which is backed by Philadelphia capitalists. Work is being prosecuted under the supervision of A. J. Heath, a former Utah mining man. The company's holdings were originally developed by the Shurtleffs and resulted in the opening of commercial ore in considerable tonnage. The property lies a few miles to the east of Crown King station. The plans of the company include the building of a narrow-gauge railroad to connect with the plant of the Randolph-Gemmill Reduction Co. at Crown King.

Jerome.

Four Jackhammers and two shifts of miners are employed in deepening the shaft on the property of the Jerome-Portland Co. The shaft has at present a depth of 110 ft. and is being sunk at the rate of 3 ft. per shift. Yellow sulphides are frequently encountered. The hoist, compressor and other mine machinery recently installed are working satisfactorily.

The mill on the Copper Chief Co.'s property is treating 130 tons of gold ore daily and is making an excellent recovery of values by means of the cyanide process. The company will resume shipments of copper ore to the Humboldt smelter as soon as the sampling works at that plant is rebuilt. The latter was recently destroyed by fire.

A dozen camp buildings are under construction near the site selected for the main working shaft on the property of the Green Monster Mining Co. The buildings include two bunkhouses with accommodations for 40 men, boarding house, storehouse, office building, residence for the superintendent and a clubhouse. The new shaft will be sunk on the diorite side of the main contact about 300 ft. distant from the Revenue tunnel. The work will begin just as soon as the machinery, now en route to the property, has been installed. It is expected to deepen the shaft at the rate of 125 ft. per month.

CALIFORNIA.

Jackson.

The leading mining companies of Amador county have posted a notice warning the miners that a general strike will be the signal for the closing of all the mines for an indefinite period. This includes the Argonaut, Bunker Hill, Kennedy, South Eureka, Central Eureka, Plymouth Con., Original Amador and Keystone properties. It is stated any further advance in wages is beyond consideration, as many of the companies are operating on small profit margins. The labor leaders demand \$4 per day for miners, \$3.75 for muckers, and that all mines be entered and left by the men on the time of the company. The more conservative leaders assert that no strike is contemplated at present.

Placerville.

The Mt. Pleasant Mining Co. has been reorganized under the title of the Grizzly Flat Mining Co. with a capitalization of \$250,000. New York people are stated to be interested. The mine has been opened to a depth of 1100 ft. by a shaft and good ore is said to be exposed on several levels. Under the new ownership developments will be vigorously conducted and a mill may be installed.

Weaverville.

Lessees are still operating the Union Hill hydraulic mine of the Trinity Con. Co. and making good cleanups. Considerable water is still available and the present season is proving an exceptionally profitable one, the result of the heavy snowfall of last winter. It is understood the parent company will operate next season. At the La Grange a heavy yard-

age of excellent gravel continues to be hydraulicked. The company is commencing to repair its flumes and ditches and arranging for working of much new ground with arrival of winter storms.

Prospecting of placer ground for dredge mining continues actively along the Trinity and its tributaries. The Trinity Development, Pacific Dredging and other strong companies are particularly active. The Pacific Dredging and Valdor dredges will go into commission within a few weeks. Prospecting is particularly active in the Carrville, Lewiston and Weaverville fields.

Sonora.

The Little Wonder quartz mine has been bonded to John Hassell and associates of New York, and preparations are being made for comprehensive developments. The mine lies within the corporate limits of Sonora and adjoins the Faxon mine on the south. Some high-grade ore has been extracted, but the bulk of developed material is of medium grade.

Quincy.

It is reported that the owners of the Poormans Creek hydraulic mine have completed arrangements for resumption of activities after a long period of idleness. A large restraining dam is to be erected, the reservoir enlarged, and other work completed. The mine formerly ranked among the leading placer producers of the state.

Yreka.

The owners of the Eliza mine are planning to work the property along broader lines. On No. 5 level, in 1700 ft., a large amount of free-milling ore has been disclosed and it is planned to drive a lower tunnel and open the ore bodies to better advantage. Approximately 70,000 tons of ore averaging fully \$5 have been blocked out. Equipment includes a 10-stamp mill, and it is probable that the capacity of the plant will be largely increased. The property is owned by R. H. De Witt, A. E. Junker, and W. B. Shearer of Yreka. O. H. Lawson is manager.

Grass Valley.

The California mine is being reopened under supervision of E. C. DeGolyer and equipment will be installed as soon as possible. The property was recently taken under bond by King C. Gillette for \$80,000, the payments to be made in three annual installments.

The old mining camp of You Bet was recently visited by fire and practically destroyed. The You Bet placer mine is still operated by a Chinese company, working under leasing arrangements with the Colorado owners. The gravel is worked by the drift method.

Quincy.

Heavy shipments of chrome ore are going out from the Onion Valley district, and from the vicinity of Claremont. W. T. Baldwin of Oroville and associates are interested in the Claremont deposits and contracts have been signed for immediate shipments. While a number of deposits throughout this section have proven shallow, a few are of more persistent type. Motor trucks and mule teams are hauling to stations on the Western Pacific railway.

Downieville.

The channel recently intersected in the White Bear mine is steadily widening as its dip is followed, and the gold is becoming coarser and more plentiful. In the drift from the main raise the channel is 2 to 3 ft. wide and arrangements have been made to sink a winze. Two shifts are engaged.

The ledge in the City of Six mine has been tapped and work is proceeding to demonstrate its value and extent. As soon as this has been done a lower adit will be extended and lateral work pressed. The tunnel was extended 111 ft. in hard serpentine in 26 days, with only one shift employed at times. Sol Camp is in charge of operations.

COLORADO.

Cripple Creek.

In reviewing operations for the district during August the mill of the Portland Gold Mining Co. reported an in-

crease of 1000 tons over July, and this ore was \$1.50 a ton higher value. The Independence mill treated 2400 tons more ore than in July. This plant is closed down temporarily and will remain closed until the proposed improvements are completed. It is planned to double the capacity of the Independence from 600 tons to 1200 tons. The mill and the new sampler will start up at the same time. It is expected operations will be resumed at the mill and the sampler about Jan. 1. The Caley mill, located on the property of the Jerry Johnson Mining Co., resumed treatment in the closing week of July and was operating steadily all through the month. The plant treated 60 tons per day of low-grade mine and dump ore from the Jerry Johnson. The Ironclad Hill mill of the Rex Gold Mining Co. resumed treatment last month and tested the low grade ores on its property, with profitable results. Both the Reed and the Worcester mills were shut down for some time during the month, due to breakdowns. The closure, however, was but temporary and both plants are again in operation. The Wild Horse mill of the United Gold Mines Co.; Isabella mill, Isabella Mines Co., and the Blue Flag Gold Mining Co.'s mill remained inactive. The ore production from the active mining properties totaled 95,268 tons with a gross bullion value of \$1,294,343.52. The average value of all ores treated was \$13.60 a ton. As compared with the July figures, material increase is shown in both tonnage and valuation, amounting to 10,368 tons and \$109,936 in value. There was but slight difference in the average value of the ore treated, the July ore averaging \$13.96 and the August valuation \$13.60.

The Roosevelt tunnel broke previous records during August when 437 ft. were driven. The former record of 400 ft. was made in dry ground where within the ground now being worked is extremely wet. The main shaft of the Golden Cycle mine is the terminal point of the tunnel and is 6400 ft. east from the present heading, which heading is now 1294 ft. east of the Elkton Con. main shaft. T. R. Countryman, Deputy U. S. Mineral surveyor, gives his report for August as follows: During the month 27 days of three shifts each were worked. Some delays occurred on account of accidents in the Elkton shaft. The breast of the tunnel is now 1294 ft. east of the Elkton main shaft. It is still in the Comstock lode and about under the easterly side line of the Fido lode. At a point about 30 ft. from the breast a small vein was cut running N. 49 30 W. and dipping west 77°. A short distance west of it a phonolite dike about 15 ft. thick was passed through, running N. 35 30 W. and dipping about 72°. The country rock is a very hard, tough, fine-grained breccia, requiring usually about 30 holes to a round. No additional water courses of any consequence have been encountered. The total flow from the portal is now 10,350 gals. a minute.

Telluride.

Ore shipments for August, 1916, was 19 cars greater than 1915. Last month the shipments were: Tomboy, 45 cars; Smuggler, 32 to Durango and 20 to Blende, a good part of which was Black Bear ore; Liberty Bell, 19 cars; Columbia Leasing Co., 2 cars; William Anderson, 1 car; total, 129 cars, nearly all of which were concentrates.

The management of the Matterhorn Mining & Milling Co. is timbering a crosscut on Butterfly ground, through which it intends driving on its property later. This crosscut is now in over 4000 ft., and the Matterhorn expects to drive in another 600 ft. to open one of its leads.

The Highland Mary Mining Co. struck 2 ft. of good shipping ore in their property on Swamp canon, near Ophir.

Leadville.

A large body of iron-manganese ore has been uncovered at the Jason mine. Ore has been opened in several places and assays from 21 to 25% manganese and 27 to 30% iron, with only a small percentage of silica. The stope has been opened in places to a width of 10 ft. and is increasing in dimensions. Preparations are being made to produce a large and steady tonnage, which has been contracted for by the steel works at Pueblo. It is reported that an output of 50 tons daily will be maintained. The ore was opened on the 250 level, where a drift cut the shoot after driving 50 ft. It appears that the drift cut into the middle of the ore, as its

boundaries have not been definitely determined as yet. The property had been idle a few weeks. The shoot is an entirely new one.

IDAHO.

Wallace.

According to rumors circulating both locally and in the Coeur d'Alenes, the Tamarack & Custer Mining Co. has purchased the Frisco mill, near Gem, from the Federal Mining Co. and will take possession immediately. No authoritative confirmation of the report is obtainable from either the Federal or the Tamarack & Custer managements, but the belief prevails generally that the deal, pending for several weeks, has been closed. To connect the Tamarack & Custer workings with the Frisco mill a 3-mile aerial tramway, traversing the divide between Nine-Mile and Canyon creeks, will have to be installed, but it is said that plans for the carrier already are prepared, and that construction can begin as soon as material is assembled. The Tamarack & Custer properties have been closed down for several weeks, following the surrender of the Rex mill and tramway to the Rex Con. Mining Co., and it is believed that every effort will be made by the management to get production inaugurated again as soon as possible. The Tamarack & Custer Co. has been treating its output in the Rex mill, which it had under month to month lease, and the tramway had been removed to connect the Tamarack & Custer workings with the plant. The carrier now is being restored to its former location, and reports received recently from President M. J. Sweeney of the Rex Co. state that the mill has been overhauled in preparation for treating the Rex ores, and that shipments probably will begin by Sept. 15.

At the first annual meeting of the reorganized Vienna-International Mining Co., held recently in Wallace, Dr. Charles R. Mowery, mayor of Wallace, was chosen president; A. H. Featherstone, vice-president, and R. A. Marshall, secretary-treasurer, the two last named also of Wallace, and Frank C. Bailey of Spokane, general manager. The holdings of the company, recently acquired by Bailey and his associates, are in the Placer creek district of Shoshone county, and the new owners are planning extensive development as soon as a compressor plant and power equipment, already ordered, are installed.

Recent reports state that three large ore shoots have been developed in the Ray-Jefferson mines, and that a fourth is being opened. The reserves are said to be sufficient to assure steady production when active operations are begun. The 450-ft. raise, connecting the No. 1 and No. 2 levels, was finished last week, exposing 12 ft. of ore, with only one wall in sight.

The Hercules mine, the premier silver producer of the northwest, closed down for several days, has resumed production on the 5th on a small scale, but the output will be increased to the normal rate as soon as new and larger electric transformers are installed in the concentrator. The old transformers are being removed to the new mill being constructed at the confluence of Beaver and Carbon creeks by the Ray-Jefferson Mining Co., and which will be ready to operate soon.

Kellogg.

The net earnings of the Caledonia Mining Co. were \$287,932 for the quarter ended June 30, according to report of Secretary Charles McKinnis, mailed to stockholders with the monthly dividend checks on Sept. 5. Dividend disbursements for the 3 months were \$234,480, leaving the surplus for the period \$53,453. Shipments during the 3 months were 4079 dry tons of ore and concentrates having a gross value of \$435,346, made up as follows: Lead, 2,574,680 lbs., \$188,146; silver, 294,242 ozs., \$200,578; copper, 167,233 lbs., \$46,622. Smelter deductions for freight and treatment totaled \$110,927, making the net smelter returns \$324,419. The operating cost was \$36,486, of which \$29,726 was for mining, \$5852 for milling and \$907 for shipping. Regarding mining operations during the quarter the report says: "Since our first quarterly statement, issued May 1, we have continued the development

work on the Keating tunnel level. So far this has been unsuccessful. We have found neither the ore nor the vein. We propose to continue the search so long as there is a possible chance of success. Since our former statement there has been no development that would justify us in changing the estimate made at that time of the probable future of the mine." According to the statement made by the company in May, there was nearly two years' ore in sight and could be expected to continue the payment of 3-ct. dividends for 7 months, after which, perhaps, the dividends would be 2 cts. a month for another year.

The vein in the Highland-Surprise mine has been recovered beyond the Big creek fault, where the Surprise lead was lost a number of weeks ago, and a report from President W. W. Papesh of the Highland-Surprise Co. states that the conditions are much better than at any previous period of development. The new shaft now is down about 40 ft., following an ore stringer 30 ins. wide, carrying 14% lead, 28% zinc and 10 ozs. silver. Diamond drilling has disclosed a 4-ft. vein 260 ft. below the shaft, and the sinking is being done to open this deposit. The mill at the property is operating 10 hours a day, and President Papesh states that the recovery has been increased approximately 33½% since the new ball mill was installed.

Hailey.

The new 300-ton mill being constructed at the North Star-Triumph mine will be ready to operate about Oct. 10, according to Frederick Burbidge, general manager of the Federal Mining & Smelting Co., which recently acquired the property under lease and bond. The mine has been unwatered, and Burbidge states that the conditions in the lower levels are equally as good as those in the upper workings. A branch railway, connecting the Oregon Short Line system with the mine and mill probably will be constructed and operating in the next 5 months, the building costs to be borne jointly by the Federal and O. S. L. companies, but pending the installation of the line the output of the property will be transported to the shipping point, 6 miles distant, by wagons.

Adair.

Shipments from the Richmond mine, suspended last December, have been resumed, and two 4-horse teams now are hauling ore to the railway at Saltese, Mont., 5½ miles from the property. Only the ore extracted in development is being forwarded, and two grades are being mined, the second-class, averaging between 5 and 6% copper and about \$10 gold, being sent to the Anaconda Copper Co.'s Washoe smelter, and the high-grade, running about 20% copper, is going to the British Columbia Copper Co.'s plant at Greenwood, B. C. "During the time that shipments were suspended development was continued, and from 12 to 20 men have been employed," said Charles Heidenreich, general manager. "We have a considerable tonnage in reserve, and we feel confident that we will be able to maintain shipments at the rate of a car a week to Anaconda, and a similar amount to Greenwood. The ore is being taken from an upraise from the main lower tunnel, now in about 1650 ft. and with a vertical depth of 400 ft., being driven to connect with the old surface shaft. We will have to raise about 280 ft. to make the connection, but the raise is in ore all the way and will provide plenty of material for shipments. The Richmond is one of the old properties of the Saltese region, and quite extensively developed. The forest fires that swept the district in 1910 destroyed the surface equipment, including the camp buildings, compressor plant and hoisting machinery, and the shaft was allowed to flood. I succeeded in associating new interests with me a number of months ago, and since then we have extended the underground system and have opened immense bodies of commercial ore."

LAKE SUPERIOR.

COPPER.

Houghton.

Almeek has found good grades of copper in the Kearsarge Conglomerate, which lies about 1500 ft. west of the Kearsarge amygdaloid, on which the Almeek mine is now

working. The width of the lode was about 30 ft. and the commercially mineralized part has a good width; the opening was made on the 10th level of No. 2 shaft, which is the northern of the two earlier shafts located at the south end of the property.

New Baltic has concluded the exchange for 10 acres that belong to the Johnson heirs which it desires for a shaft site. This final settlement of the negotiations that have extended over a period of several months is very advantageous to both parties. It is adjacent to the 2 acres purchased earlier in the year to the north. The company will begin to sink immediately the shaft to open up the property.

Cass' first diamond drill hole is now down over 1600 ft. The second hole is now being started so as to continue the crosscut over the strike of the Forest lode, on which the Victoria is now mining. Very little is known of the formations at this end of the series and much valuable geological knowledge is being obtained. Dr. L. L. Hubbard, formerly state geologist, and Supt. A. H. Meuche, formerly assistant state geologist, have charge of the work.

Houghton Copper has about 110 ft. of good ground in the northern drift on the 12th level, the bottom of the exploratory winze on the Superior lode, this being the whole distance opened. On the West vein, where drifts have driven for about 60 ft., there is but little copper except in the one stretch of 20 ft. On the 4th level, where the Superior lode has recently been cut into by a drift, the showing is not now of commercial grades. The 6th level stopes are in fair ground.

New Arcadian is getting some excellent coarse-grade amygdaloid rock at the shaft on the newly found lode thought to be the Old Arcadian, which it is sinking from the 50-ft. level to the 100. The openings at No. 1 shaft are displaying good rock, especially at the 250, the 900 and the 1250 levels. The shaft at No. 1 is down over half way, or about 140 ft., to the 1500 level from the 1250.

Isle Royale has stopped its work of cleaning out the bottom of No. 1 shaft, so as to use all the men in getting out the rock; it has eight drills in operation, the most of them on the Portage lode. At No. 7 shaft, though it has been holed down to the 7th level, it has not been cut out to full size only to a short distance below the 4th level. In holing by means of raises it is cheaper to get through with a small passage as possible and then to widen out to the required width by breaking down the rock and using the passage as a shoot.

South Lake has had only one crosscut to the Butler lode, on the 3d level, but is now cutting another on the 6th. The rock there is still running high and has a depth on the lode of about 2000 ft. The work has exhausted the money raised by the last assessment, but none will be called now, as there will be from \$25,000 to \$30,000 coming from the smelting of the mass and mineral. Then when No. 3 lode is cut through to the Lake mine a constantly rising tonnage will be available.

Calumet & Hecla is doing better in its daily tonnage this month owing probably to the slight return of the men from outdoor occupations, and is averaging about 9960 tons as compared with 9400 for the last part of August; there will be slight increase at least this month, and probably a still greater in October.

Allouez, according to a most dependable insider, is in the very best condition underground in its history; the openings are now disclosing their highest grades, and this means from the North Kearsarge boundary to the south to the Almeek line to the north. The costs are about at their lowest, and the construction costs will be very small for quite a long time to come. Men here have not been so scarce as at many of the other properties, and the tonnage is being kept up to the 2000 tons a day standard.

Quincy is forwarding its normal, which is also its maximum, of about 4000 tons daily; the nearness to the city of Hancock assists greatly in holding and attracting men; moreover, the company is pretty well supplied with houses.

Franklin had its best yield in refined copper in August and about as high a tonnage as at any time since the reopening of the Allouez Conglomerate. The southern drifts are

still meeting with the better grade with occasionally the spectacular stretches.

IRON.

Duluth.

The Mines Efficiency Co. has been formed in Duluth for the purpose of giving consideration to geological, mining and metallurgical engineering problems in the Lake Superior and other regions. Particular attention is to be given to the beneficiation of iron and manganese ores. Mr. Newton, of the company, has spent 4 years studying the latter phase of the company's specialties. Of the firm is Harlow H. Bradt, who spent some time in Ishpeming with the Pittsburgh & Lake Angeline Co.

Virginia.

Many new open pit mines have been opened in the western part of this range during the season. It is of note here that most of the mines were shipping 6 months from the time development was started. The Oliver Iron Co. is stripping the Arcturus mine. This property received the first experiments as regards the concentration of iron ore. The mine will not ship this year and much of the present activity has been confined to getting the property ready for stripping next winter. Most of the stripping was done by Butler Bros. Operations at the Lamberton property started last winter and the mine was producing the first of July. At Nashwauk the Mace No. 2 mine was developed by the Longyear-Bennett interests. This was an open pit stripped with a 370-ton Bucyrus shovel. It is a small property to which shipment of 200,000 tons was assigned for the present season by its owners. West, the Harrison mine has been developed and mined by Butler Bros., who are selling much ore to the Jones & Laughlin Steel Co. The big shovel at the Mace is operating at this mine. The Kevin is being developed. This is a state lease also stripped and mined by the Butler Co. Stripping operations were started last winter and the mine shipped its first in August.

MISSOURI-KANSAS.

Joplin, Mo.

In addition to the heavy curtailment of ore production by the ore producers during the last 2 months, the smelters in the Pittsburg field are now following suit and are closing down their plants so that the metal output will be curtailed. It was reported that all the coal-burning plants in the east Kansas belt were closed Saturday, with the exception of parts of two, both of which were preparing to also close as soon as the ore supply was exhausted. The lowering margin of profit is said to be the cause of the shutdown.

Ore producers in the Joplin field continued their policy of closing down more plants. The production has received drastic cuts now for a number of weeks and it is believed that the output is not over 4500 tons, or certainly not over 5000 tons. But with the small volume of sales there is not very much relief from the big surplus stocks that have been held now for several months. It seems now that the surplus stocks of ore have dropped to a little below 30,000 tons, but this is a huge tonnage for this field.

In the camp of Blendeville southwest of Joplin there is a revival of operations and prospecting that is bringing in a number of new producers. J. C. Vaughn and associates have just made a strike of lead and zinc that has shown a recovery of 30% over a custom plant. This strike has caused considerable excitement and a number of other leases have been taken and work resumed in that vicinity. Short & Co., on an adjoining lease, has taken out ore that has yielded 12% for some time. A number of new milling properties promise to be erected in that vicinity before the winter season sets in.

Another new milling plant has been added to the Bell Center portion of the Joplin camp on the Linderman land. The Mary O'Reilly Mining Co. has just completed a 100-ton plant on a lease south of the Lucky George mine. Here at a depth of 147 ft. the company has developed what is believed to be a very good run of ore. Also at 108 ft. the company is taking out considerable ore. A part of the ground is what is considered soft ground and part of it

hard ground. For the present only the soft ground deposit is being worked.

Webb City, Mo.

The new Coahuilla mill at Duenweg has just been completed and has gotten under way. It is designed to handle in the neighborhood of 1500 to 2000 tons per 24 hours' run, and it has been giving results of approximately 1800 in the first week of its operation. It is believed when the plant is going right fully a car of concentrates per day will be turned out. C. A. Smith, who has long been general manager of the property, designed the new mill.

The Onamena plant No. 3 at Duenweg is now getting well under way after a period of preliminary work due to the necessity of cleaning out the old drifts which had long been under water. In addition to this work the company has also sunk a new shaft to open up a deposit of ore which a drill hole showed to be very rich in a recent prospecting campaign. The shaft is just now reaching the ore. Geo. J. Kusterer is the general manager of this property.

On a lease of Haywood Scotts, near Duenweg, a recent drill hole showed a run of ore which averaged 9.94% zinc for a distance of 42 ft. The ore was encountered at 231 ft. and continued in it to 273 ft. The hole was put down to test out a hole put down a number of years ago, which was reported rich, but was never developed. The Scott Mining Co. will now put down a new double compartment shaft on the new hole.

Commerce, Okla.

In the Commerce camp the Bethel Mining Co. has started its new mill and has turned out its first 2 cars of concentrates. A car of lead and a car of zinc blende were sold, the first showing concentrates carrying 84% lead and the zinc showing 61%. The new mill is recovering high percentages. The company also has the Croesus mine and mill and is unwatering the ground. The company has 2 ore levels, the upper one at 160 and the lower at 180 ft. Every effort is being made to get this plant ready for operation by the time there is a recovery in prices.

An arrangement was made the past week whereby the half interest in the Iowa & Oklahoma Mining Co., which was owned by Major William Grimes, was taken over by Shewey & Sullivan of Joplin, and arrangements were made at once for a revival of operations on 500 acres of mining land right in the heart of the old Quapaw camp. This land has been in litigation for a number of years and this has prevented any active operation until this was cleared up and the present arrangement provides for this. Leases were let upon part of the land this week and operations will be resumed as rapidly as the ground can be gotten in readiness.

Another mill will soon be added to the active list of producers in the Pilcher camp on a sublease of the Pilcher Co. land when the Piokee Mining Co. completes a 300-ton mill. The land has been thoroughly drilled out and a shaft will be sunk and the ground opened up as rapidly as possible. Just as soon as the ground is in such condition as to show the necessity of the mill it will be constructed. The assays of the prospect drill cuttings showed a zinc content running from 5 to 24%. Those interested in the lease are H. O. Abbott and A. C. Haprock, Lebanon, and J. H. Wright of Joplin.

Out of five drill holes put down on a lease of the Admiralty Co.'s lease, the B. L. & G. Co. have made as many strikes of ore. In every hole put down the company has encountered rich ore, running from 5 to 20%. The prospecting is being continued and a shaft will be started soon.

MONTANA.

Butte.

With the average price of copper for August above 26 cts., an increase of 25 cts. per day will be applicable to the August wage scale of mining companies operating in the Butte district. This increase will make payrolls of these companies probably the largest in the history of the Butte district. The Anaconda Co. alone will distribute \$1,630,000

in wages to Butte employes, and this, with settlements of other companies, will bring the total up to a figure in excess of \$2,250,000, a gain of nearly \$150,000 over July. The Anaconda's Butte payroll for July was \$1,520,500 in round figures, so that the increase shown by this company alone due to the advanced wages is approximately \$110,000. In view of the fact that the increase of 25 cts. per day is applicable to employes at Anaconda and Great Falls as well, a proportionate increase in the payroll is shown by the former, while at the latter, due to cutting off of construction work and employment of fewer men, there is a slight decrease. Anaconda payrolls at Anaconda will aggregate \$606,400 for August, compared with \$587,100 for July. At Great Falls the company's August payrolls will aggregate \$280,750, as compared with \$290,400 for July, the increase in wage scale, however, doing much to compensate for the smaller number of men employed. Approximate estimates of August payrolls furnished by companies other than the Anaconda operating in Butte show that they will distribute something like \$700,000. This, compared with approximately \$675,000 distributed in payment of July wages, hardly affords a fair basis of comparison, in view of the fact that the Butte & Superior Co., one of the big producers, suspended operations for 10 days in August, during which their tonnage was considerably decreased, and other companies report larger forces employed in July than in August.

The Butte-Zenith is now down to 1000-ft. depth. An electric pump of 600-gal. capacity, manufactured by the Imperial Iron Works and similar to the one on the 1600 level of the Butte & London, will be installed. Hard ground has been encountered since the 750-ft. was passed. All of the water was caught on the 800 level and was thrown to the 500 with a Cameron pump, where the electric pump lifted it to the surface. On the 1000-ft. level crosscutting will be started by Oct. 1 and within 200 ft. it is expected to cut the first vein, known as the "Economical" ledge.

The output of the Butte & Superior mine and mill for August was reduced almost a third from the normal on account of the accident, which caused the closing of mine and mill for 10 days. The production of ore was 34,000 tons against a usual production of slightly over 50,000 tons. The production of zinc concentrates from this ore amounted to 9600 tons as compared with 14,000 tons in July. The zinc in concentrates amounted to 10,475,000 lbs. as compared with 15,000,000 lbs. in July. Recoveries for August were 91.5%. There were 300 tons of lead concentrates and 192,000 ozs. of silver produced.

Great Falls.

Delay in filling orders for the machinery parts required in both the new zinc concentrator and the new zinc refinery are responsible for the delay in getting these new departments of the Anaconda at the Washoe and Great Falls plants into operation. The refinery cannot start up until the concentrator is operating and can furnish the necessary concentrates. One of the five sections of the big zinc refinery at Great Falls has been started and is being tried out. This will take several days and officers of the company state that it will be the middle of September before the entire plant can be put into operation. The one section that has been started is proving most satisfactory and comes fully up to the expectations of Mr. Laist, who practically worked out the new zinc refining method that is being put into effect.

Maxwell.

The Northwestern Mines Con. Co. is sinking a double compartment shaft about 700 ft. from the portal of the main tunnel level. At a depth of 40 ft. the shaft passed through a vein of copper sulphide 8 ft. wide, carrying values of from 6 to 10% copper, 4 ozs. silver and a trace of gold. Six cars of concentrates and low-grade ore were shipped to Anaconda during July at a net return, above freight and treatment, of approximately \$3000. Recently a cloudburst damaged the dam of the Granite County Electric Power Co., necessitating the closing of the Consolidated 100-ton mill. The damage will be repaired within a few days, however, and it is expected that the plant will then commence a long full-time run.

Elliston.

Ore said to run as high as \$60 is being picked from the dumps of the Julia mine, 9 miles from Elliston. It is stated

that two men living in that vicinity have been able to pick out as much as a ton a week. The ore contains silver, gray copper and lead. The Julia properties were located about 10 years ago, and since then about \$120,000 has been taken out. They are owned by the Montana-Clinton Co. The development work includes a shaft about 300 ft. deep, a tunnel 600 ft. long, besides various crosscuts and drifts. It is probable that a 2000-ft. tunnel will run in to tap the larger ore bodies and to make it easier to pump out the water and hoist the ore. The company also has an interest in the Monarch mine, 5 miles distant, and a plan to erect a plant on Telegraph creek to generate electricity for the operation of both properties is being considered.

NEVADA.

Tonopah.

A narrow vein 6 to 8 ins. wide has been intersected on the 1400 level of the Belmont, west of the shaft. It runs high in gold and work is proceeding to determine its extent. The company is preparing to prospect the East End group, of which control was recently acquired for \$50,000. It is said explorations to a depth of 2500 ft. will be carried on with diamond drills. The company has definitely surrendered its option on the Bull Moose property at Carrara, after several months of explorative work.

Tonopah Extension has installed a small hoist on the 1540 level of the Victor shaft and is sinking to the 1850-ft. point. The Murray vein continues to average 13 ft. wide on the main levels, and the North Merger ledge maintains a uniform width of 10 ft. A quarterly dividend at the rate of 15 cts. has been declared.

The output of Tonopah Mining is again exceeding 2300 tons per week and the grade of ore has increased to \$15. The best ore is coming from the Sand Grass claim, with the Upper Sand Grass and Breccia veins yielding the richest product. On the 1640 level of the Silver Top claim, west of the shaft, a 3-ft. shoot of excellent ore has been intersected.

Rochester.

New work has begun on the 250 and 420 levels of the Rochester Mines group. On the 250 level ore of splendid grade is exposed and the drift is advancing along the East vein. The same vein is undergoing development at the 420-ft. point. The capacity of the mill is being increased and the plant will be handling approximately double its present tonnage before the end of fall.

Goldfield.

The southwest drift from the 250 level of the Lone Star has entered the quartz zone and is being extended to seek the shoot which yielded rich ore when worked by the old Patrick lease. If results prove satisfactory the management intends to prosecute work at several promising points.

The west crosscut from the 1750 level of the Atlanta has intersected what appears to be the hanging wall of the Consolidated vein. Low assays in gold and copper are being obtained and crosscutting continues to open the main ledge. The work is designed to open the extension of a shoot which on the 1500 level assayed \$30 to \$70. The company has increased its working force and is prosecuting developments with renewed vigor.

Sinking of the shaft of the Silver Pick is again proceeding rapidly. The new No. 7 Cameron pump is easily handling the water and within a few days the shaft is expected to enter the main ore zone disclosed by the Calyx core drill. Later on the vein of \$25 ore intersected at the 875-ft. point will be developed. The Calyx drill has reached a depth of approximately 1200 ft., 450 ft. west of the main shaft, without any indication of the shale formation. It is stated three distinct veins have been penetrated, all yielding good assays.

Yerrington.

A promising copper discovery has been made a mile south of the Mountain View mine by James Adams, R. V. Taylor and D. W. McKenzie of Yerrington. Assays average 16% copper, and a little silver also occurs. Arrangements

have been made to work the deposit and determine its dimensions.

Seven Troughs.

Unwatering of the Seven Troughs Coalition has been completed and repairs are being rushed. Work has been resumed at some points and within a few days the company expects to resume production of rich ore from the 1700 workings. The new pumping plant is expected to prevent future water troubles.

Winnemucca.

A 5-ft. vein of sulphide ore assaying \$40 gold, silver and copper has been opened at a depth of 130 ft. in the Wolverine mine. Shipments have started and sufficient ore is stated to be exposed to insure a steady yield. Arrangements have been made to install a Cameron pump and to send the shaft deeper. F. L. Andregg is superintendent.

Bullionville.

The new mill of the Prince Con. has been placed in commission on the old tailings in this district, and is reported to be making a satisfactory recovery. The amount available is figured at 120,000 tons. The company also operates the noted Prince Con. group at Pioche.

Kimberly.

The Con. Coppermines Co. has let a contract for \$100,000 with the General Engineering Co. of Salt Lake for the remodeling of the old Giroux Concentrator which was built in 1907 on the hillside above Riepetown and never used. The mill was recently inspected by J. M. Callow, the oil flotation expert, who advises installation of pneumatic flotation machines. It is expected to finish the new mill by the new year. The Morris No. 2 shaft is to be deepened 200 ft. to get under the Morris-Brooks-Bunker Hill ore body, in accordance with which plans, churn-drill prospecting from above has been discontinued.

Reno.

The stockholders of the Luning-Idaho Mining Co. held the annual meeting here. About three-quarters of the stock of the company was represented at the meeting. The articles of incorporation were amended, increasing the board of directors from three to five and changing the main office from Luning to Reno. The following directors were chosen: R. G. Withers, R. M. Todd, W. T. Erickson and R. B. Todd. The directors were requested to appoint the fifth director later. Reports of the financial condition of the company, the standing of the treasury stock account, etc., submitted by the secretary, were read and approved. The management reported the work accomplished at the mine since starting up in December and reported that shipments would be started at once, and that the first carload would leave Luning this week. Much delay in starting shipments has been made owing to the lack of teams for hauling, as well as shortage of cars for shipments. The future development of the mine was discussed and the company will undoubtedly sink a working shaft as soon as the connection with the contact is made, the Hahn tunnel now being extended as rapidly as possible in that direction. The management can thus better decide whether the working shaft be sunk on the hanging-wall vein, the foot-wall vein or the blind ledge or middle vein exposed in the Hahn tunnel.

NEW MEXICO.

Mogollon.

Cleanup by Mogollon Mines Co. for last half of August produced three-quarters of a ton of gold and silver bullion and 4.5 tons high-grade concentrates from treatment of approximately 2400 tons of ore during period. New shaft is now 880 ft. deep and has encountered andesite on both walls. Work on the company's flume to convey tailings to storage dams on Mineral creek, about 4 miles below, is being pushed and with prompt lumber deliveries will be completed this fall.

The Oaks Co. is continuing to find good mill ore from development work on both Clifton and Eberle mines, and is making regular shipments to local custom works.

The tailings disposal system adopted by Socorro Mining & Milling Co., consisting of an elevator by which the mill

discharge will be conveyed to an adjoining flat, has been delayed by the equipment having gone astray in railway transit.

The U. S. Geological Survey, through Henry G. Ferguson, is about to complete data for a geological folio of the district. A detail survey was made a few months ago and Ferguson is now working in the geology of the individual properties. When finally completed this data will be of inestimable value to the camp as a whole.

Pinos Altos.

The C. & O. Co. has taken over the Savanna properties under lease. It is the intention of the company to install the latest model flotation process for the treatment of the Pinos Altos ores, the success of which has been demonstrated by the operation of the present mill, in addition to the experiments of eastern specialists. J. W. Crowder, mining engineer, El Paso, visited the camp recently, when the plans for the improvements were decided upon. A force of men were put to work at the Gillette mine, where ore bodies that are already developed will be mined as one of the sources of supply for the enlarged mill.

Lordsburg.

It is believed that the 85 Mining Co. will soon erect a plant at its property. A test mill has been established by the company at the Texas School of Mines, Fort Bliss, Texas. J. W. Crowder is in charge of the plant and is making complete tests of flotation and wet method of treating the ores. Representatives of several of the largest flotation companies have visited the mine and have gone into the problem of concentrating the ore. A number of shipments have been made to various test plants, and it is believed that the correct method of treatment will soon be solved. The company is connecting the main shaft of the mine with the new 500 level. A raise is being made from the winze sunk some time ago. A sump has been excavated and everything is ready for work on the new level.

OREGON.

Cornucopia.

Queen of the West Mines Co. has contracted with the A. Leschen & Sons Rope Co., St. Louis, for a 2-bucket, 3200-ft. tramway. The line will have a fall in this distance of 1456 ft. The tram replaces a single line built several years ago.

Halfway.

The Queen of the West cyanide mill is rapidly nearing completion. The tanks are in place and the machinery is all on the ground, but not in place. It will be, however, in a few days. Carpenters are scarce, but a large force is now working and it will not be long until the plant is under cover. The tram is occupying a large force. Several new stations are being put in and a new tram station is being built at the mine. The work is being pushed as rapidly as conditions will allow. There are about 25 men at the mine and the same number at the mill.

Paker.

A 4-ft. vein of silver-gold ore has been opened at the D. M. Kelly mine on Roch creek.

SOUTH DAKOTA.

Custer City.

Under George Playford the Golden Crest mine is being reopened. He is engaged in retimbering an old shaft, sunk on the vein many years ago by Fritz Webber, the original owner of the ground. This shaft, which is free from water, has reached a depth of 215 ft., and at that level had struck the foot wall. From the foot wall a drift of 80 ft. has been run, all in ore, and the hanging wall of the vein has not been struck. The ore carries good commercial values, is easy to mine and mill, the present system of treatment in the Crest mill being particularly suited to it. After the work of retimbering the shaft and drift, the work of extending the drift

toward the hanging wall will be continued, and the ore body explored at the depth to which the shaft has been sunk. The work that is being undertaken in this old shaft is being done for the purpose of giving the ore body at depth a thorough development. This development could have been given the property from the main workings, but they are now flooded and continue to make about 150 gallons per minute, so it would be quite expensive.

In completing its plans for the receiving and handling of custom ores the Trojan Co. has started work on a raise from the Halford tunnel to surface, which will break through the ground near the Burlington and the Northwestern lines just west of Trojan.

UTAH.

Garfield.

By not later than Nov. 1 the sulphuric acid plant of the Garfield Chemical & Mfg. Co. will be completed. Work has been delayed on account of material not arriving. The chemically treated bricks with which to line the chambers are just beginning to arrive, although they were ordered months ago. These come from Akron, O., and on account of labor trouble they have not arrived, but are now beginning. The concentrating plant which is being built in connection with the acid plant is moving ahead and it is expected that the installation of machinery will start this week. The building is practically completed and nearly all the machinery is on the ground. It is expected that the acid plant will be running in advance of the leaching plant being built by Utah Copper, which will use most of the product. The acid plant when completed will cost about \$500,000. It will start out with a capacity of 100 tons of acid. The company contemplates increasing the capacity to 150 tons. The ultimate capacity can be 1000 tons. It will take a period of several years to work up to this and make a market for it.

Salt Lake.

Details are now being worked out and the design of a new sampling plant to be located here is nearly completed. The project has been financed by mining interests that at the present time control between 12,000 and 15,000 tons of ore per month, the greater portion of which heretofore has been going through the process of sampling before it was shipped to the smelters. Delays in getting the ore sampled, due to the rapidly increasing tonnage at the present plant, resulted in the plan to build another. Negotiations are under way for the purchase of the site of the new sampler. It will have an initial capacity of 750 tons per day and can be increased by adding additional units. It will be of the Vezin type, the same type that is used at present by smelting companies. Its cost is estimated at \$75,000.

Stockton.

With the filing of incorporation articles by the Keystone Development Co., the Galena King Mining Co., the Southport Mining Co. and the Merwin group, consisting of 37 patented claims, have been taken over. The property consists of claims along the strike of the lodes for 8000 ft. Over \$500,000 of lead-silver ore has been shipped from the properties. They are producing at present under leases. On the Galena King recently a rich strike was made by a leaser. On this ground there is a 1000-ft. shaft and numerous other workings. The Southport has a 1700-ft. drift from the Honerine tunnel, besides work done in other places. It is the intention to extend the tunnel on the Merwin group to the Galena King shaft, cutting it at a depth of 600 ft. The company is capitalized for \$100,000, consisting of 1,000,000 shares of a par value of 10 cts. In payment for 500,000 shares of the stock the company accepts the various properties, the remaining stock is held in the treasury. Officials are J. B. Overton, Madison, Wis., president; Duncan MacVichie, vice-president; W. C. Alexander, secretary and treasurer. These with the following compose the directorate: Charles Cochran, Williamsport, Pa.; David Keith, L. H. Farnsworth, Charles C. Dey, Joseph E. Galigher and D. L. Wertheimer.

Peterson.

At the Morgan-Argentine the vein is growing stronger with development in the upper level and a lower tunnel is

now being pushed to open the vein at depth. There are 2500 ft. of workings and at 176 ft. in the shaft high-grade galena was cut. General Manager Pembroke says "lead ore has been found on the surface in 12 places. To develop the principal fissure a shaft was sunk and at a depth of 176 ft. ore was struck. A drift was started and bunches of ore were encountered. When the main vein was struck, which is approximately 2½ ft. wide, high-grade galena was encountered. The main body is a carbonate and scattered through it are masses of galena assaying as high as 83% lead. The lower tunnel, some 300 ft. below the workings, will be continued to cut the downwards extension. The values in silver so far have been low, the highest assay showing 44 ozs. Numerous fissures traverse the property showing lead-silver ore and there is one fissure that shows copper values. The company is capitalized for 500,000 shares, par value 1 ct., and 149,072 shares have been issued, leaving 350,928 shares in the treasury.

Eureka.

The plant of the Tintic Milling Co., near Silver City, is treating about 85 tons per day. Within the next 2 months this will be raised to 300 tons. General Manager George H. Dern said in discussing the work now under way at the mill, that he had received word to the effect that six new Holt-Dern roasters had arrived. The two others that have been ordered are scheduled to arrive at the mill in a week. These, with those now in operation, will bring the capacity up to 300 tons. Metallurgists that have visited the plant and examined the process state that the problem of treating the low-grade siliceous silver-copper ores of the Tintic district has been solved.

The lower workings of the Tintic Standard are now being ventilated by a power fan. A car of ore a week is being shipped and a body of shipping ore of excellent grade has been developed in the lower levels, according to the management. As the ore is broken and without any preliminary sorting it runs better than 35% lead. As the work progresses the ore body on the 1600 level continues to grow larger. It has now been drifted on for more than 50 ft. and has been crosscut at right angles to the drift for a distance of 50 ft., with all faces in ore. General Manager Raddatz says that he had as yet been unable to determine just how large the ore body is, nor has he been able to determine its strike. A new shaft is being sunk, and the company has recently installed a new compressor. It will deliver power enough to put three shifts of miners, with drills, to sinking the new shaft, and also to put three shifts of miners at work on the ore in the lower levels.

At the Sioux Con. a winze is being sent down from the 600 level in an attempt to get Iron Blossom's vein extending into Sioux Con. ground. It is understood that Sioux Con. directors have authorized the sinking of the main working shaft and that a contract may be let for this work. Sioux's shaft is now down 600 ft. and if sinking is taken up the shaft will be deepened 500 or 600 ft.

Bingham.

Synopsis of report of superintendent New Utah Bingham Mining Co., for Sept. 1. Bonanza tunnel. Advanced 57 ft. Total 480 ft. This tunnel running to the south on the Giant Chief vein encountered a break in the formation throwing the vein 10 ft. to the west. Some isolated pieces of iron pyrite and galena have been found in the vein, but no continuous streak has yet been found. There are some smooth rounded boulders of ore lying in a fissure. These isolated bunches of ore are increasing as work progresses. Giant Chief Main Level No. 6 Raise Drift to Vein No. 7. Advanced 35 ft. Total 35 ft. This raise is going up on the foot wall on the ore previously opened up. Some small pockets of low-grade ore have been opened, but no continuous ore body has yet been cut. Giant Chief Main Level No. 7 Raise. Advanced 12 ft. Total 133 ft. At this point the work broke into the crosscut from No. 6 raise. Bunches of mineralized matter and ore have been encountered. More of these are found as work proceeds. The ground is opalized chert and looks favorable for an ore body.

It was announced Sept. 3, 1916, that not for six weeks would the Federal Court in Salt Lake City confirm the Ohio Copper Mining Co.'s sale, or order it vacated as a stay for that period had been granted by the Federal Court in New

York on petition of stockholders not satisfied with the bondholders' proposed plan of reorganization. The New York court ordered the Ohio trustees to give to stockholders' representatives a complete list of registered holders of both stock and bonds in order that their views on reorganization might be secured. Two stockholders' committees would likely come into the field. The stock could be assessed \$2 per share should it be found necessary to raise new working capital, but operations had been so profitable that trustees and receivers were reported as having about \$400,000 cash on hand, against about \$60,000 unsecured liabilities.

WASHINGTON.

Spokane.

August sales on the Spokane stock exchange aggregated 809,800 shares, valued at \$178,094, according to the official report for the month of Secretary Charles T. Underwood. This is the lightest monthly business of the exchange for the current year, the decrease in sales being due principally to the vacation season.

Success again was the leader in the trading for the month, but the price was materially less than in previous months, and Lucky Jim was second and Slocan Star third.

WISCONSIN-ILLINOIS.

Ore deliveries were reported by districts for August as follows:

	Zinc, lbs.	Lead, lbs.	Pyrites, lbs.
Benton	18,662,000	564,600	90,000
Galena	5,808,000
Millin	4,144,000
Cuba	3,928,000	60,000	2,160,600
Linder	3,504,000	77,970	160,000
Hazel Green	2,940,000
Shullsburg	2,352,000	30,000
Platteville	2,216,000
Highland	850,000
Montfort	342,000
Mineral Point	238,000	728,000
Potosi	70,000
Totals	45,054,000	782,570	3,138,600

The gross recovery of zinc concentrates totaled 35,298,000 lbs.; net refined ores from separating plants to smelter, 18,942,000 lbs. The Mineral Point Zinc Co. delivered 57 cars refinery product, all high grade, to smelter at DePue, 4,512,000 lbs. The Hard Fibre Co. of Delaware, and the Sandoval Zinc Co., new buying interests, were represented in the field. The Mineral Point Zinc Co., Wisconsin Zinc Co. and National Separating Works were the heaviest producers and refiners of crude ore.

Highland.

The introduction of two new mining and milling plants will assist in a better output, but prices are not satisfactory, for zinc concentrates and shipments are light. Saxe-Lampe, Red-Jacket and Eberle mines are all operating with full surface equipment.

Linden.

A large surplus of zinc ore held in bin, low prices for zinc ore the cause, and wages and mine supplies abnormally high, are factors regarded as most discouraging, and yet no signs of abatement are seen here. Two new power, mining and milling plants have been completed here, one for the Mineral Point Development Co. on the Wickes farm and the other for the Spring Hill Mining Co. Optimo Mining Co. No. 3 has liquidated all debts and is now on sound business basis. The Optimo is one of the new outfits to come in this year. Five drilling machines are engaged in proving the Gilman mine lease with excellent results. A big strike of zinc ore 8 ft. in thickness has been made with drill on the Vial land, known as the Glanville extension.

Platteville.

Eastern interests in combination with local corporations have perfected a working organization, the plan and purpose of which is to bring into combination enough zinc ore pro-

ducers in this field to insure an output of 200 tons of zinc concentrates daily, this to be diverted under exclusive arrangement to a smelter plant in the coal region of Illinois. Each corporation to share alike in the operation and results. For the present names are withheld, but a working capital has already been subscribed and experts are engaged in working out the problems.

Montfort.

The O. P. David mine, shipping zinc ore regularly, has been opening new deposits in untried ground and a heavier output is insured.

New Diggings.

The liveliest zinc mining camp in the entire field, all viewpoints considered, is found here. There are 1000 miners employed in the mines in this district. New mine development and the building of more new mining plants is being rushed on all sides. The Wisconsin Zinc Co. is now trying out a new 200-ton mill on the Chas. A. Thompson mine ready to go into commission. Another plant is nearing completion on the Longhorn, but production will scarcely be attempted before the latter part of October. On the C. A. Thompson, the new shaft went through 40 ft. of milling area, insuring a wonderful zinc ore producer. The shaft is complete at a depth of 160 ft. The new Champion mine is making 250 to 300 tons of zinc concentrates weekly averaging 36%. A recent innovation is the complete installation of a table house. Heretofore mining companies have been content to install one or two sludge tables, but the Champion's eight Wilfley tables are in operation. At the Skinner Separating plant, the property of the Wisconsin Zinc Co., 1000 tons of various grade zinc ore is handled weekly, the high-grade finished product being sold in open market to the highest bidder. In addition to the large working forces employed by this company at all plants going double shift daily, are 10 drilling squads working on several newly acquired leases in this district, with as many more at work in the Galena camp.

The Fields Mining & Milling Co., one of the large operating companies of this district, is shipping an average of 1 car of zinc concentrates daily from its two producers, the Crawhall and Thompson mines. The Crawhall, presumed sometime ago to have run its natural course, is now better than ever, much mineralized area having been developed under the old workings. Besides re-milling tailings on the Crawhall, accumulated during several years' high run and successful operation, the company is rebuilding the Empire magnet in Ore Separating plant purchased from the Wisconsin Co. at Platteville. This plan involves designs to provide smelter facilities under a new process in which costs are said to be far below any now obtaining.

The Vinegar Hill Zinc Co. has begun the construction of a new 200-ton modern mining and milling plant on the Edward Meloy 80, in the very heart of the zinc belt of this section. The ground has been explored and shows deposits, according to the drill log, in places 60 ft. in thickness. The introduction of the Whaley electric shovel at the Martin mine, one of the Vinegar Hill mines, is doing the work of 20 shovelers. More machines of this type are now being secured for early installation.

WYOMING.

Casper.

During the week ending Sept. 9 Elkhorn No. 1 well was brought in. In spouting it went as high as 130 ft. The casing has now been placed and the well will be ready for production as soon as tanks for storage are furnished. The company has made arrangements to drill several more wells on this lease and have contracted for tankage to be placed on the ground in time to care for the oil which now is almost a certainty in that section of the field.

The Standard Exploration Co., drilling for the Merritt Oil & Gas Co., has brought in two good wells during the week, No. 2 on Sec. 3 proving to be the biggest producer yet struck in the field. This well came in Sept. 8. It showed considerable gas pressure and continued to flow at intervals of about an hour all during the first day. The driller has

been unable to shut in the well. Teams were being used in the hurried building of sumps in which the oil was being caught. The first made sumps were overflowing, which continued to increase, one interval of spouting followed another. For over 15 minutes the well spouted a 3-in. stream of oil a distance of 20 ft. through an opening in the side of the rig housing, the stream being highly impregnated with gas. Estimates of the well range from 50 to several hundred barrels when it settles down. The drill had only entered the oil sand a few inches when the oil started to flow. The same company brought in another well, No. 1, Sec. 4, the same afternoon, but as soon as the sand was struck the well was shut down.

CANADA.

BRITISH COLUMBIA.

Greenwood.

Permanent development, following extensive diamond drill exploration, is verifying the predictions of the engineers regarding the extent and value of the deposits in the Copper mountain holdings of the British Columbia Copper Co., according to Oscar Lachmund, general manager, who personally is in charge of operations. "The new main tunnel, now in 1000 ft., has crosscut one end of the ore body, and a drift now is being run on it," said Lachmund. "The tunnel is being continued to reach other shoots, and is being advanced at the rate of about 20 ft. daily, except where we have to timber through soft ground. The bore is 9 by 10 ft. in the clear, and will open the property to what is known as the glory hole level. We now are installing a pumping plant to raise water from the Similkameen river to furnish power for the mine equipment and a 50-ton experimental mill. The pipe line is 6000 ft. long, and delivers the water at a distributing point 1700 ft. above the river level. The experimental mill is for the purpose of working out a treatment system for our ores, preparatory to the construction of a 2000-ton concentrator, to be erected at a site on the Similkameen river."

Vancouver.

The Granby Mining, Smelting & Power Co., with mines in different parts of Alaska and British Columbia, together with immense modern copper smelters at Anyox and Grand Forks, is producing an average of 4,000,000 lbs. of blister copper monthly, according to Frank M. Sylvester of Vancouver, general manager. He states that all difficulties of a mining and metallurgical nature that hampered operations at the Anyox smelter and Hidden creek mines during the first year or so that they were in production have been overcome, and conditions now are satisfactory in every way. "In pursuance of the company's policy of expansion, which contemplates the Anyox smelter and the Hidden Creek mines as the nucleus of an immense industry, we always are on the lookout for promising new properties, and in the last year we have had not less than 100 examined by our engineers," said Mr. Sylvester. "Of our newer properties two now are on a substantial producing basis. The Midas mine at Valdez, Alas., is shipping to the smelter at Anyox. The Maine mine on Prince of Wales island, also in Alaska, is shipping between 4000 and 5000 tons monthly. A number of others are producing on a smaller scale. We are able to get this tonnage moved because through a subsidiary company we own and operate our own fleet of steamers. The Grand Forks plant put its 7th furnace into operation on Sept. 7. As the Crow's Nest Pass Coal Co. now seems to have overcome its labor troubles and to be in a position to keep us supplied with coke, I anticipate that we shall soon have the 8th furnace blown in and be running at full capacity once more."

ONTARIO.

Cobalt.

On Sept. 5 the 600-ton flotation plant of the Buffalo Mines Co. was put in operation. Callow machines are used and the plant will treat tailings from the dump, as well as concentrates from the mine. The dump is the accumulation of tailings from the old mill for a period of over 7 years. The system of treatment previous to the introduction of

oil flotation in the camp did not make anything like so close a recovery of silver from ores treated as can be done by the oil flotation system and the re-treatment of the tailings can be done very profitably and at a very small cost. No information has been given out as to what the tailings at the Buffalo will average, but the tailings in the dumps from some other mills in the camp will, it is estimated, average as high as 5 ozs.

Kerr Lake produced 1,260,000 ozs. of silver during the first 6 months of 1916 according to company reports. In June it established a new record of production with 237,942 ozs. This compares with 234,598 ozs. in May, 225,423 in April, 214,902 in March, 163,995 in February and 184,697 in January. Estimates of ore reserves Sept. 1, 1915, showed 4,172,000 ozs. of silver, indicating a diminution of 1,526,300 ozs., as against 2,036,962 produced during the year. In addition to its ore reserves, Kerr Lake has \$750,000 in cash and cash assets in the treasury, or about \$2,510,000 in all, equivalent to \$4.18 per share on the 600,000 shares outstanding, to which should be added the value of the company's holdings in the Caribou-Cobalt property.

Kirkland Lake.

A considerable tonnage has been blocked above the 300 level at the McCane mine. A strike of some importance was made in a crosscut when a vein carrying free gold was encountered on the latter level. The known width of the vein is at least 4 ft. This strike occurred in the crosscut driven from the south from the main workings on the 300 level. Seven ft. south of the shaft a 7-ft. vein was encountered. Across its entire face average assays ran \$16. The crosscut was continued further south, and after breaking down a distance of 7 ft., another vein came in.

Gowganda.

Sinking has been commenced on No. 44 vein at the Silverdale mine. The vein is 8 ins. wide and carries good silver values. The work will be done by hand steel but it is the intention of the company to install a compressor and hoist this winter, owing to the difficulty in getting in machinery in summer. Work was started on this property in early summer. Up to the present time it was confined to surface work. In the course of this work 8 veins were located, most of which carry values. The best of these is a 2-in. vein, called Vein No. 2. While sinking is under way now a force of men will be kept on surface trenching and stripping until winter. The property consists of 10 claims in Leith Township, surrounding the Hudson Bay claims.

Schumacher.

In a drift from the main shaft of the Schumacher mine a vein showing free gold has been encountered on the 100 level. The crosscut from the 200 level, from which the ore for the mill will be taken from, is being rapidly pushed forward to reach the vein on that level. Progress in sinking the new shaft is being made. It is to connect the two shafts, which are 1400 ft. apart, by drifting along the ore. It may require 6 months to do this if the indirect courses of the veins are followed. In the meantime a temporary arrangement will be installed, probably a light aerial tramway, to bring ore over to the mill from the new shaft. From the latter shaft crosscuts will be run to pick up two veins. The present mill is equipped for 125 tons but by forcing it the tonnage is brought up to 140 tons. An extra agitator may be put in and some increase to the tank capacity made in order to handle 160 tons.

HONDURAS.

It has just been reported that the Guggenheims have recently acquired an important interest in the New York, Honduras & Rosario Mining Co. This company has been operating continuously for over 36 years under more than a dozen presidents. The company is the largest single industry in the Republic of Honduras; a former president was the original owner of the mine. There are many outside mining propositions open to Rosario management and located in Honduras which are expected to be developed, with the affiliation of the Guggenheims. H. A. Guess, the Guggenheim representative, joins the Rosario board of directors.

World's Index of Current Literature

A Weekly Classified Index to Current Periodical and other Literature, Appearing the World Over Relative to Mining, Mining Engineering, Metallurgy and Related Industries, in Four Parts.

Part 1. *Geology*—(a) Geology; (b) Ore Genesis; (c) Mineralogy.

Part 2. *Ores and Metals*—(a) Metals and Metal Ores; (b) Non-Metals.

Part 3. *Technology*—(a) Mines and Mining; (b) Mill and Milling; (c) Chemistry and Assaying; (d) Metallurgy; (e) Power and Machinery.

Part 4. *General Miscellany* (including Testing, Metallography, Waste, Law, Legislation, Taxation, Conservation, Government Ownership, History, Mining Schools and Societies, Financial, etc.

Articles mentioned will be supplied to subscribers of *Mining and Engineering World* and others at the prices quoted. Two-cent stamps will be received for amounts under

\$1. Subscribers will be allowed a discount of 5 cts. if the price of the article exceeds 50 cts. The entries show:

(1) The author of the article.

(2) A dash if the name is not apparent.

(3) The title, in italics, of the article or book. Titles in foreign languages are ordinarily followed by a translation or explanation in English.

(4) When the original title is insufficient a brief amplification is added. This addition is in brackets.

(5) The journal in which the article appeared; also the date of issue, and the page on which the article begins.

(6) Number of pages. Illustrated articles are indicated by an asterisk (*).

(7) The price.

Year.....	49.690	23.470

Difference in domestic and foreign prices explained by the fact that the New York quotations are per fine ounce; the London per standard ounce 8.925 fine.

Copper.—Very heavy buying of copper has continued. Foreign and domestic business has come before sellers in a never-ending stream. Dominant among the week's transactions is 5000 tons copper taken by the Russian Ministry of Munitions, which is now negotiating for a similar sized block of copper. Resellers who were doing business for this year at concessions advanced their prices following the sale to Russia and at this writing the market is very strong. As intimated in the last letter negotiations on the copper requirements of the entente allies would not long remain inactive. The large financial house handling this matter has resumed dealings with copper producers for 300,000,000 to 400,000,000 lbs. for delivery next year, starting from April. Producers instead of being asked to bid on a stated amount have been requested to tell how much copper they would care to sell for delivery from April to December at a price of 26 cts. In view of the fact that sales for the first half have been made at 27 1/4 cts. the price of 26 cts. offered by the allies may appear to be satisfactory, but producers would rather limit the tonnage sold at this price, as the situation is such that a better figure could be obtained early next year on ordinary transactions. It is likely, however, that the matter will now be closed, as producers concerned agree that the price meets with their approval. A Canadian inquiry for 1,000,000 lbs. copper for delivery 30 days after October 15 is now in the market, while active domestic inquiry calls for about 20,000,000 lbs. for delivery this year and over the first quarter of next year.

Now that the closing of the allied copper order is rendered certain copper factors are looking forward to further expansion in general buying. Regular consumers take war buying as their guiding point. When England buys copper for a year ahead, paying the high price, then regular consumers see their way clear to do the same thing. Thus the placing of a large war order for copper constitutes a sign for increased domestic buying. In the past week absorption of copper for the fourth quarter of this year has been so heavy that two of the large producers have been forced to withdraw from the market being sold up for this position. Spot and October electrolytic was offered by some dealers down to 27 1/2 cts., but at this writing they are holding firm for 28 1/4 cts. for these months. Important first hands continue to take orders for the fourth quarter at a flat price of 28 cts., but some producers are asking 28 1/4 cts. for what little copper they still have unsold. Despite the heavy buying of copper that has gone in the past five weeks, domestic consumers are

still seeking metal for delivery this year. This can only be regarded as a sign of improved domestic consumption, an indication which is borne out by the demand for finished copper goods. Spot casting copper has advanced to 25 3/4 @ 26 cts., while for the fourth quarter 25 1/2 @ 25 3/4 cts. is the prevailing price.

Estimates place the total copper production for the seven months up to Aug. 1 at 1,043,000,000 lbs. The entire refinery capacity of the country in 1915 was 1,634,000,000 lbs., so that there must be a substantial increase in refining capacity to take care of the ore and half refined copper. August statements of the copper companies show some good gains. Inspiration produced 11,450,000 lbs.; Anaconda, 28,800,000 lbs.; Kennecott, 10,200,000 lbs.; Braden, 2,616,000 lbs., and Shannon, 860,000 lbs. The latter two are the only ones showing declines.

A high copper authority asserts that considerable new refining capacity will come into play this month and increase the marketable copper in October. August refinery yield did not run above 160,000,000 lbs., but September may go close to 165,000,000 lbs., and October probably 175,000,000 lbs. Such increases would be valuable in meeting the insatiable demand. Producers now have orders on their books for shipment this year that make these increases in refinery yield necessary.

The market at London has held fairly steady. Last week standard copper receded slightly, but the closing price made up the loss. Electrolytic has advanced £2 to £132. Standard copper opened the current week £1 higher in spot and 1s up in futures.

Quotations for copper per pound at New York for the week ended Sept. 13 were as follows:

Tin.—Weakness has become evident in tin. Continued absence of demand as well as conditions that would favor the metal have finally broken down the reserve of sellers at the Straits, who are now offering freely at concessions. Since our last report the market has been flat, with but minor changes in prices. At the opening of the current week a decided recession took place, being forced by a break at Singapore. Spot Straits tin was offered down to 37½ cts., while spot Banca could be had at 36½ cts. and spot No. 1 Chinese at 36 cts. Futures were also affected by the reaction. Consumers are well supplied up to November, but there remains some buying to be done for December. Sellers had hoped to force the issue, but consumers withheld and now conditions appear to be shaping so that they can not only cover December needs but buy well into next year at low prices. Straits tin for September and October delivery has been offered at 37½ cts., while for November and December delivery sellers asked 37 cts. Limits from the Far East for January and February arrival held around 37½ cts. Last week Straits tin at London declined £1 to £170 and Singapore shipments £2 10s to £171. Singapore opened the current week £1 down at £170 10s, while Straits at London eased off only 5s to £169 15s. On the break at Singapore there were no sales, a development that seems to typify the final breaking of the control exerted by factors at the Straits. The total visible supply on Aug. 31 was 18,012 tons, representing a decrease of 362 tons from the month previous. The total stocks were 8892 tons, against 8887 tons. The total afloat the close of August was 9150 tons, against 9517 tons on July 31.

Arrivals of tin since the first of the month total 815 tons, while stocks afloat to this country total 3980 tons.

Quotations for tin per pound at New York and per ton at London for the week ended Sept. 13 were as follows:

Lead.—Scarcity of spot lead and a very small supply for late September have served to strengthen the lead market considerably and while prices are repeated the trade is waiting for an advance by the American Smelting & Refining Co. Independents do not care to send their prices any higher, as there is now a difference of 20 to 25 points over the A. S. & R. Co. figures. If, however, the leading interest comes up to 6.75 cts. New York the independents will quickly go to 7 cts. Japan has been in the market for a fair amount, but domestic users appear to be well covered. The government has done some buying for the arsenals. Canadians have not

been in the market, but it learned that a contract for 160,000 cartridges is now being figured in this country and may soon be closed. This may be the forerunner of more cartridge contracts here, a development that would further strengthen the lead situation. Independents have quoted 6.70 @6.75 cts. New York and 6.50@6.55 cts. St. Louis, while the principal producers' quotations have been 6.50 cts. New York and 6.42½ cts. St. Louis. Independents reported that users were sounding the market for October metal and it is learned that some outside interests took business for that month at around 6.50 cts. New York.

Producers are all well sold up for this month and also have orders for October. There appears to be no lead on the market. Brokers report that what few inquiries they have had have been difficult to fill, as sellers were not in evidence. Lead at London has been declining. Last week spot dropped £1 to £30 5s and futures 15s to £29 5s, with further declines this week.

Quotations for lead per pound at New York and per ton at London for the week ended Sept. 13 were as follows:

Sept.	New York		London	
	Indpts.	A. S. & R. Co.	Spot.	Futures.

Lead Ore.—Virtually no change was noted in the ore market of the Missouri-Kansas-Oklahoma district during the week ended Sept. 9 and though the bulk of the buying was at \$65 there were some few lots that went at as high as \$67. Production for the week was down over 600,000 lbs. and totaled 1,725,275 lbs. of concentrates bring the yearly production to 72,567,747 lbs. The values of these amounts were \$55,927 and \$3,057,981.

Zinc Ore.—In unison with its allied metals zinc ores remained the same as during the previous week in the Missouri-Kansas-Oklahoma district. Large sales of ore stocks was a common rumor during the first part of the week but this subsided when nothing for its substantiation could be brought out towards the end of the week. Prices ranged from \$45 to \$65 during the week ended Sept. 9, and the production was given at 6,477,070 lbs. for the week and 152,106,144 for the year. The week's production was valued at \$176,332 and the year's at \$20,082,841.

Calamine.—Nothing new has become evident in this market and the demand seems fair at the price of \$30 to \$40 which is entirely unsatisfactory to the producer. Production for the week of 140,000 lbs. was only about 30% of that of the previous week. The total for the year was 20,772,610 lbs. and valued at \$740,336, while the week's production was valued at \$2,800.

Spelter.—On persistent urgings by dealers a fair amount of buying of spelter for the fourth quarter was done by brass makers. The dealers pointed out that prices were reasonably low considering war times, and that the metal represented a safe purchase. The advent of business, of course, brought a minor advance in the price. The market appeared to be fairly steady, but it is apparent that consumers must be prodded. A few foreign inquiries have appeared, notably one for 500,000 lbs. for Canada and about 1000 tons for France. Spot moved up to 8½ cts. New York and 8¾ cts. St. Louis, while for the fourth quarter there were sales at an average price of 8.50 cts. For October alone sellers asked 8½ cts., with November and December quoted at 8½ cts. Various reports designed to force consumers to cover were noted. Thus there were reports of a gas shortage hampering smelters, while some dealers who are holding good lines for the fourth quarter issued some very wild reports, but without success, as users of spelter are pretty well posted on the situation. At London the market moved up towards the close of the past week, going to £50 for spot and £44 for futures, making further gains this week.

Quotations for spelter per pound at New York and per ton at London for the week ended Sept. 13 were as follows:

	New York	London

MISCELLANEOUS METALS.

Quicksilver.—Poor demand for quicksilver has resulted in prices receding. Selling agents made three reductions last week, bringing the price down to \$75 per flask for spot virgin. Adequate supplies from Europe and Mexico are beginning to exert a repressive influence on the high prices.

Antimony.—There has been no improvement in the demand for antimony. As a result spot supplies are again beginning to accumulate on sellers' hands. Spot has been offered freely down to 11½ cts., while sales are known to have been made at 11 cts. Consumers are well supplied.

Aluminum.—Demand continues fair, with the market holding steady. Prices are repeated at 60@62 cts. per pound for spot virgin in ton lots.

Spiegeleisen.—While furnaces are asking \$55 per spot 20%, business can be done at \$45@50 without much trouble.

Pig Iron.—Business in pig iron continues brisk, with

more large tonnages purchased. The Brier Hill Steel Co. has taken 20,000 tons basic for the fourth quarter at a price equivalent to \$18 valley. A Pittsburgh dealer has taken 10,000 tons basic for the first half at \$18.50 valley, but this price is not yet generally established. Foreign demand for bessemer remains large. Foundry business continues good. The American Locomotive Co., Westinghouse Electric & Mfg. Co. and the Standard Sanitary Mfg. Co. are in the market for round tonnages, while a considerable miscellaneous business is being negotiated.

PENROSE SHAFT, PRINCIPAL PUMPING CENTER. DOWN TOWN MINES, LEADVILLE, COLO.

Leadville Pumping and Drainage Projects

W. A. SCOTT.

The purpose of this article is to present some of the main facts relating to the pumping and drainage systems of Leadville, Colo., whereby the deeper levels of the mines of Carbonate, Fryer and Breese hills, and contiguous territory, have been dewatered. This has been accomplished by establishing pumping centers on several groups of mines, and by connecting the Yak tunnel with the workings of mines in the territory tributary thereto. Three pumping projects, of great importance to the district, deal with the three drainage basins of Carbonate and Fryer hills. One of these is at Penrose shaft, on lower Carbonate hill, which is the center of a group of 15 mines controlled by the Down Town Mines Co. Another is at the Harvard shaft, through which the mines of Leadville Unit on Fryer hill have been unwatered. The third is at Wolfstone shaft, on upper Carbonate hill, the water basins of which is cut off from that of the Down Town Mines. Other pumping plants contributing to the drainage of Wolfstone basin are on the Greenback and Mikado. The Wolfstone pumps have been in operation many years: those at Penrose and Harvard shafts are recent installations.

Down Town Mines.

The Down Town group, controlled and operated by Down Town Mines Co., under 20-year leases, comprises the Penrose, as the center of pumping and mining, the Coronado, Midas, Niles-Augusta, Grey Eagle and Pocahontas, Star, Weldon, Bon Air, Bohn, P. O. S., Midland, Alice, Otosito, Hibsche, Bison, and oth-

ers. The Penrose belongs to ex-Governor Jesse F. McDonald, the others are under various ownerships in Colorado and other states. The conditions of the leases permit the entire group to be operated as one property, and the drainage system is in control of the Down Town Mines Co., the lessee.

The area of ground thus consolidated amounts to 400 acres, and extends under a part of the city of Leadville. It contains a number of shafts, other than the Penrose, and most of the old workings are connected. All these properties were closed down in 1907 by reason of inability of all interests to unite on a central pumping project. They remained closed until this company took possession as lessee and installed power and pumping equipment in 1915. The Penrose has a depth of 900 ft., and when the work of unwatering was begun on May 8, 1915, the water level was at 238 ft. below the collar of shaft. The unwatering to the bottom of shaft was completed on June 13, 1916, and at this writing the company is preparing for actual mining operations.

The task of effecting this consolidation, the formation of the operating company, the installation of equipment and the dewatering of the group, has been put through under the direction of Jesse F. McDonald, general manager, who is one of the individual owners as well as a member of the lessee company.

Penrose Pumping Plant.

Penrose shaft contains five electric-driven, centrifugal pumps. The bottom station, at close to 900 ft.

depth, has two 2-stage, 8-in. centrifugal pumps, each driven by a 300-hp. General Electric motor, and having the capacity of 1500 gals. per minute for a 450-ft. lift. At the 450-ft. level is a relay station, containing two other pumps of type and capacity similar to the two at the bottom station. The pumps at lower station discharge into those at the relay station; that is, the discharge of lower station pumps becomes the suction of the relays, the latter discharging through a tunnel outlet about 60 ft. below the collar of the shaft. During the unwatering period the two lower station pumps were used as sinking pumps, having been suspended by $7\frac{1}{8}$ -in. red-strand Leschen cables.

At the completion of the shaft dewatering, they were set in position on bed plates, as station pumps, above referred to, at bottom of shaft. These two and the two relay pumps were manufactured by Providence Engineering Works, Providence, R. I.

The fifth pump, lately installed at the lower station, is a 4-stage, vertical, centrifugal pump, operated by a 650-hp. General Electric motor, having capacity of 2000 gals. per minute, for a lift to the surface or 900 ft. This was made by Harris Engineering Works, Providence, R. I. It has a guaranteed efficiency of 70%. The guaranteed efficiency of the 650-hp. motor, which drives the 2000-gal. pump, is 93.3% at full load, and 93.6% at less than full load. This large pump, with motor, stands 18 ft. high, and in lateral dimensions takes up but little station room.

The two smaller pumps at lower station, and the two relays at 450-ft. level, are auxiliary to the 2000-gal. pump.

The volume of water being handled at this time is 2600 to 2700 gals. per minute, although it is thought the normal flow from the basin will be considerably less. During the dewatering period of 9 months, when all the work was performed with the two sinkers and their relays, their rated capacity was greatly exceeded, as 4200 to 4400 gals. per minute were raised to the surface. In like manner, the four 300-hp. motors were actually operated at 375 to 400-hp., and it is said they stood the crowding well. While the two sinkers were being operated electric light wires, suspended from a twin cable reel at surface, were attached to the pumps to afford light, and these wires unwound as the pumps were lowered. Current for hoist, compressor and pumps at Penrose shaft is furnished by Colorado Power Co., being received from the latter's plants at 6600 volts, and transformed down to 550.

In order to provide for reserve power, three 6600-volt lines connect the transfer here with the power company's nearest substation. This mine has three 300-kva. transformers in service, and one extra in reserve.

Current for the 2000-gal. station pump is transmitted through a 900-ft. cable, suspended from a cable head at collar of shaft. This large cable is rubber insulated, 3-conductor, lead sheathed and wire armored, and was furnished by General Electric Co. The other four electric cables, attaching to the four smaller pump motors, are each 3-conductor, rubber insulated, submarine type, jute filled, double-wire armored. The cables which served the sinking pumps were handled by hand winches during that phase of pumping.

The starting and stopping of the sinking pumps were controlled at the surface by signals from the pumpmen; the main station pump operations are controlled directly at the stations.

The Hendrie & Bolthoff double-drum hoist, originally steam operated, has been converted into an electric hoist. Hoist is controlled through magnetic con-

tactors, enabling the operator to handle a heavy current by means of an easily operated master controller.

The pump installations and operations have been under direct supervision of William Angus, master mechanic, while C. D. Criley, electrician, has supervised the installation of all electrical equipment and connections.

Early operations in the Penrose and other mines of the Down Town group were mostly in the lead carbonate ores of the upper contact, which ran high in

PROVIDENCE 2-STAGE SINKING PUMP.

silver; but the Penrose shaft cuts through the second and into the third contact, where there are sulphide ores, consisting of lead, zinc and iron, with silver and gold. There is, however, much carbonate ore in the second and third contacts; but the two lower deposits, which are below the natural water level, are not extensively developed. With the ample facilities now provided for keeping workings clear of water down to the 900-ft. level, the lower contacts will be explored, developed and mined. It is estimated that 500 tons of ore per day will soon be produced through

Penrose shaft, and other shafts of group may be put in order for hoisting ore.

Leadville Unit.

A group of mines on Fryer hill, under long-term lease to the U. S. Smelting, Refining, Mining & Exploration Co., is locally known as the Leadville Unit, of which H. S. Lee is resident manager, with E. A. Hamilton as superintendent. In this consolidation for operating purposes are such claims as El Paso, Little Miami, Tip Top, Harvard, Jamie Lee, Olive Branch, Forepaugh, Fitzhugh, Corabelle-Bangkok, Little Sliver, Joe Davis, Shannus O'Brien, Lee Basin and Virginius.

The Harvard shaft, which is the main pumping center for the group, is on the south side of Big Evans gulch, and was sunk 10 years ago to a depth of 407 ft. There are 11 other shafts on the group, among them the Tip Top, which is being operated. Since this company took possession last January, the Harvard has been provided with buildings, and new equipment for hoisting, pumping and air compression, and they re-

tom of Harvard shaft for station pumps and for air-operated winches to be used in handling a sinker pump as work in the shaft proceeds. The Ingersoll-Rand air-compressor at Harvard shaft, of capacity of 1080 cu. ft. free air per minute, is operated by a 150-hp. General Electric motor, for which a Lenox type of short belt drive is used; in addition to this, a Laidlaw-Dunn-Gordon compressor, 1200-cu. ft. capacity, has been ordered. The two will supply compressed air for drills, winches and sinking pump. The hoist in use is a Denver Engineering Works geared type, has double drum, is driven by a 182-hp. General Electric motor, is capable of operating to a depth of 1000 ft., with a rope speed of 450 ft. per minute, carrying a 4500-lb. load. Other equipment includes an 80-hp. boiler for heating the buildings. A force of 40 to 50 men are on the payroll.

The ore in lower workings is mostly a sulphide of iron, carrying silver and zinc. The lower contact has been prospected only by diamond drill holes.

The Fryer hill water basin is segregated from other similar basins of the district, and this company's pump-

WATER FLOW, PENROSE SHAFT, DURING UNWATERING.

PENROSE ELECTRIC HOIST FROM CONTROL SIDE.

cently completed dewatering the shaft, which contained 160 ft. of water.

At the old pump station, 220 ft. below the surface, two Krogh 4-stage, 600-gal. centrifugal pumps were installed, each one being operated by a 150-hp. motor. Then, a Byron Jackson, 8-stage, 1000-gal. deep-well pump, with a 75-hp. motor, was installed at same station, and operated as a sinking pump, while the shaft was being unwatered. The deep-well pump discharged into the centrifugals which lifted the water to the surface, all operating as one unit. Now that the shaft is clear of water the two Krogh pumps are being lowered to the 407-ft. station, for use while sinking 300 ft. deeper into the lower contact.

In the meantime, all the shafts and old workings of the group have been drained; and the normal flow of water, after the accumulated volume had been drawn out, is found to be about 600 gals. per minute at existing depth of workings.

The plan of deeper sinking is to cut through the parting quartzite into the lower deposit which is in white limestone, the upper contact deposit being in blue lime. All parts of the old workings, tributary to the several shafts, are being sampled and inspected, and a geological study made of same by C. A. Allen, chief engineer, and 30 assistants.

A station has been cut out and timbered at the bot-

ing system affects only a few properties outside of its own group.

The Wolfstone.

The Wolfstone shaft is the pumping center of the Western Mining Co.'s operations on upper Carbonate hill. Its properties include Adams, Maid, Wolfstone and Mehala, and they are situated in the same drainage basin as that of Mikado, Greenback, Small Hopes and others. The Western Mining is controlled by S. D. Nicholson and associates.

The principal pump station in Wolfstone shaft is at the 1000-ft. level, where there are two steam pumps—a Knowles triplex, of 1200-gals. capacity per minute, and a Jeanesville compound, of 1000-gals. capacity, for a lift of 1000 ft. A Layne & Bowler deep-well extension pump, formerly at the 800-ft. station, has been moved to the 1000-ft. extension, the extension column from which reaches to the 1150-ft. level. The Lane & Bowler is a centrifugal, electric driven pump, which raises 2000 gals. per minute from 1150-ft. level to a tank at 1000-ft. station. The two big steam pumps, which are throwing 1500 gals. per minute from the 1000-ft. station to the surface, take their suction from the tank referred to.

The 1150 level has been under water 10 years. As soon as the water is pumped out to that depth a station

pump may be installed at that point, preparatory to sinking 250 ft. deeper. Other steam pumps situated at 800-ft. station are not now in use.

The Adams, Maid, Wolfstone and Mehala mines are all operated through Wolfstone shaft, and about 200 tons of zinc carbonate ore per day are being hoisted and marketed. On this property Arthur Dalrymple is superintendent and J. R. Dewar is master mechanic.

The Greenback, owned by P. Mulrooney, is doing a share in keeping down the water in the same basin. It has a 1500-ft. steam pump at the 900-ft. level, which discharges at the surface. A Layne & Bowler electric driven centrifugal pump has been set at 900-ft. station, the extension column to reach 250 ft., however, and raise water to a bulkhead drift at 900, from which the steam pump takes its suction. The Layne & Bowler pump has capacity of 1000 gals. for the lift required.

It is understood the Empire Zinc Co., operating the Small Hopes and other mines in that basin, is co-operating in the matter of unwatering the lower levels of the Greenback.

The Iron-Silver Mining Co., which is retimbering the Mikado shaft, is preparing to install pumps there, to draw on the same drainage basin as that of Wolfstone.

Yak Tunnel.

The 4-mile drainage and transportation tunnel of Yak Mining, Milling & Tunnel Co., which drains a large territory, underlying Iron and Breese hills, and extends beyond these through grounds of the Resurrection mine, has a flow of approximately 1200 gals. of water per minute into California gulch. The Yak is operating extensively along the course of this tunnel, and in the several places where the workings extend below it the water is pumped up to and discharged into that channel. The White Cap mine, on Iron hill, having a depth of 800 ft. below Yak tunnel, raises 150 to 200 gals. per minute. Other Iron Hill mines are drained through this tunnel.

The Resurrection mine, across Evans gulch from Breese hill, is tapped at its 900-ft. level by this tunnel. Operations below that level are carried on by means of a 200-ft. winze, through which 400 to 600 gals. of water per minute are pumped up to Yak tunnel. The Resurrection is being operated by the Yak Co. under a lease.

The most important drainage through this tunnel, aside from that of the Yak Co.'s operations, is the drainage of the Ibex mines on Breese hill, which have five shafts as follows: No. 1, 450 ft. deep; No. 2, 750 ft.; No. 3, 1000 ft.; No. 4, 1300 ft.; No. 5, 1000 ft. A level running from the bottom of the 1300-ft. shaft drains directly into Yak tunnel. Drill holes from the bottom of No. 3 shaft connect with a lateral leading into the same drainage.

Ibex operations are conducted mostly by lessees, one of the most important being the C. & G. lease, on the south end of the group, which is in the hands of T. D. Kyle, Hahnawald Bros. and Cortellini. This lease has been in force several years, and at this time 200 tons of ore per day, running \$20 in gold, is being shipped. This ore is being taken from all levels from 100 to 700, inclusive, and most of it is hoisted through the Garbutt shaft, outside of Ibex group. The ore occurs in shoots in a vein or fissure, between porphyry walls. The foot wall is well defined, and the 20 to 25 ft. of ore next to it is of smelting grade. About 75-ft. width of milling ore extends from that point and shades out into the rather indistinct hanging wall. The

gold is apparently free, is associated with iron sulphide in a silicious gangue. Mill tests show that a high saving can be made on amalgamating plates and concentrating tables. A big tonnage of milling ore, running \$8, is being accumulated. The building of a mill is a possibility.

Colorado Power Co., whose substations here are connected to its hydro-electric plants at Boulder and Shoshone, is furnishing about 4000-hph. to the mining properties of the district, for hoisting, pumping and air compressors.

Japan Now a Producer of Zinc.

A noteworthy feature in Japan's mining industry is the recent growth of zinc refining. Prior to the war there was practically no refining of zinc. All zinc ore produced in Japan was sent to Germany, but the rise in the price of zinc has made it pay to refine it in Japan. Along with the growth of refining the demand for zinc ores has increased. The largest zinc mine, according to the *Far Eastern Review*, is that in Miyagi Prefecture, owned by Messrs. Takata & Co. Last year the monthly output ranged between 300 and 500 tons, and the total was 4000 tons for the year. It is estimated that 2400 tons will be mined in the first six months and 6000 tons in the second half of this year. By January next year the monthly output is expected to be 1500 tons, or 18,000 tons a year. The Hiroo mine in Hokkaido, owned by the same firm, is expected to produce 300 tons a month, but the plants are being increased for an annual output of 5000 tons. The Yawata mine in Gumma Prefecture, also owned by the same firm, has an output of 200 tons a month. Messrs. Kuhara Mining Co. recently bought a zinc mine which produces 300 tons a month. This company, a prominent copper mining concern, has for some time been refining zinc. The Kamioka mine in Hida Province, owned by the Mitsui Mining Co., is the largest zinc mine in Japan. Its output even prior to the war was 20,000 tons per year, or over half of all the Japanese output. As improvements have been made, it is estimated that the present production soon will be increased by about 30%. The Yasuda mine, in Nagasaki Prefecture, which was producing 3000 tons a year prior to the war, is now producing 6000 tons. Thus the output prior to the war was scarcely 40,000 tons a year, but is increasing so that next year it may be over 60,000 tons.

Gold Output on the Rand.

Rand gold output in August was 781,000 fine ounces, comparing as follows:

	1916.	1915.	1914.	1913.
January	787,000	714,984	651,000	789,390
February	753,000	476,000	626,000	734,122
March	796,000	753,000	686,000	790,000
April	754,000	744,000	684,000	784,000
May	777,000	763,000	720,000	794,000
June	761,000	755,000	717,000	547,000
July	761,000	770,000	732,000	655,000
August	781,000	778,000	711,000	728,000
September	776,000	702,000	706,000
October	797,000	733,000	718,000
November	781,000	715,000	673,000
December	781,000	672,000	776,400
Total	8,888,984	8,590,512	9,124,296

Copper exports from Atlantic ports for the week ended Sept. 14 were 5446 tons; since Sept. 1, 10,584 tons; a year ago, 5427 tons.

Ore Sampling Conditions in the West

T. R. WOODBRIDGE.*

Continued from page 280.

Theoretically, the sampling of a lot of ore is a continuous process from beginning to end. It seems advisable to discuss sampling under two headings, the "outside work," or all the operations up to the point where the sample is to be dried, and the "final work," which includes the drying, grinding, and all bucking-room operations.

The sampling resulting from the outside work usually weighs from 25 to 250 lbs. and may be obtained by any one of a number of methods. These methods may be divided into so-called hand methods, involving the use of nothing more elaborate than a shovel and wheelbarrow, and mechanical, sometimes called automatic, methods, involving the use of more or less complicated machinery.

Hand Methods of Sampling.

The simplest form of hand sampling is "grab sampling." From the pile or carload of ore to be sampled small quantities are taken at random by hand, or with a small scoop or a shovel, and are thrown into a container or into a pile and held for further treatment.

This is the most rapid method of sampling a lot of ore, and, with ore of uniform grade, careful workmen obtain fairly accurate results. It is most valuable when a quick but rough check is desired on the regular sample, as, for instance, to check a possible gross error or to detect quickly whether the regular sample has been salted. The difficulty in getting the proper proportion from a small pocket of ore, and the equal difficulty of knowing how much to take from the large lumps, places the whole process at the mercy of the operator's judgment, and his knowledge of the distribution of the values may unduly influence him in selecting the material for the sample.

Pipe Sampling.

Pipe sampling can be used for fine material only, and is therefore usually confined to mill products. The simplest form of pipe sampler is a section of 1-in. pipe which is driven or pushed into the material to be sampled, then withdrawn and the contents removed by pounding the pipe. This operation is repeated a number of times until a sample of the desired size results. Another more elaborate form consists of two pipes, one fitting within the other and both having a longitudinal slot and being so arranged that after the pipes have been driven into the ore one can be turned to close the slots before being removed from the ore.

The grab and pipe methods of sampling were not found to be in general use and are so rarely suitable for ores that a more extended discussion of them seems unnecessary.

Coning and Quartering.

Coning and quartering is the oldest and best known method of sampling, and its introduction probably marks the beginning of scientific sampling. Its simplest application consists of shoveling the ore into a conical pile, flattening the cone thus formed into a circular cake of larger diameter than the base of the

cone by dragging the ore radially or spirally with a shovel, and dividing the cake into four equal sections, called "quarters," by two lines at right angles to each other and passing through the center of the cake. Either two of the opposite quarters, called the reject, are removed by shoveling and taken to the bedding floor or to storage bins. The two remaining quarters are shoveled into a cone, which is flattened and subdivided as before. This process is repeated until a sample of approximately the desired weight remains. The portion retained throughout the operation at the various stages is called the "sample." Coning and quartering is in use exclusively in two of the plants and in combination with other sampling methods in 26 of the plants visited.

The advantages claimed for the coning and quartering method are as follows: An expensive plant or complicated machinery is not required; it is applicable to all kinds and conditions of ore; it may be used for a small lot of high-grade ore without the loss that might result from putting the ore through a large mechanical sampler, and it often pleases the seller because his ore is in plain sight during the whole operation.

The disadvantages, however, are so numerous that it is difficult to understand why it so persistently survives. It is expensive, for the ore has to be moved many times by shovel and wheelbarrow, much time is lost in the necessarily frequent sweeping of the floor; it offers ideal conditions for salting by the seller, and the slightest carelessness may cause a serious error.

Whenever a lot of ore containing particles of varying size is piled in the form of a cone with a shovel or by falling from a vertical or an inclined chute, a rough separation of the fine and coarse particles is begun and is continued to the end of the operation. This is true even when the ore is finely crushed, although the separation becomes more noticeable as the differences of the sizes increase. There is no possibility of uniformly mixing the ore by this method, no matter how conscientiously the method may be carried out. The most that can be claimed for it is that the different sizes are more or less evenly distributed around the vertical axis of the cone. The separation of the particles begins with the first shovelful, and after the cone is a foot or more in height the coarser particles run down the sides, the larger ones continuing to the floor. The finer particles remain at or near the apex, while the intermediate sizes lodge on the sloping surfaces and are forced nearer to the floor with each added shovelful. If the ore be coned from a chute or spout, this condition is exaggerated, because the ore flows in a continuous small stream instead of in intermittent and heavier shovelfuls.

Bench or Cobb System.

A method known as the "bench" or "cobb" system, by which a considerable part of this segregation is overcome, is in use at two plants. It was first applied to certain high-grade ores and has given such satisfaction that it has been continued in use for over a decade. Instead of first piling all of the ore in a cone, a certain part, sometimes as little as 15 lbs., is coned. This small cone is then dragged out into a layer 1 in. or more in thickness and a similar quantity is coned on top of this layer and dragged out. This is contin-

*U. S. Bureau of Mines; excerpts from advance proofs, Technical Paper 85.

ued until all the ore is in the cake, ready for quartering. This method gives a cake with a surprisingly small amount of segregation and, as there is no large accumulation of fine particles at the center, the effects of accidental error in dragging out the ore are not so serious as in the original method of flattening from a single large cone.

Use of Wooden or Steel Cross.

The cross, which was used in the early days of mining in Colorado, is still in use at seven of the plants investigated. The arms, placed at right angles, are of steel or wood, any desired length or width, but the arms of each cross are of uniform size. Crosses of different sizes are used, depending on the quantity of ore to be sampled.

The cross is placed on the floor where the cone is to be formed and the ore is then shoveled onto it, the intent being to throw each shovelful directly over the intersection of the arms. After all the ore is placed on the cone it is flattened by the usual method into a cake as thick as the cross. The cross may also be used for quartering after the cake has been formed. This is accomplished by placing a steel cross on the cake in such a manner that its intersection comes at the center of the original cone, and then driving it down to the floor, the rejected quarters are then shoveled from between the arms. The special advantage of this device is apparent from the following description of the quartering.

The flattened cake, if the cross is not employed, is usually marked with a straightedge, or, if the cake is small, with the handle of a shovel. In order that every quarter may contain its proper proportion of fine and coarse particles it is obviously necessary that these lines should intersect at the center of the original cone. Sufficient care is not always given this important step, and it is not unusual for these lines to be marked two or more inches to one side of the center. In this way it is possible to take advantage of any known shifting of the apex of the cone. The reject quarters are now shoveled from the cake into wheelbarrows and taken to the bin. After the bulk of the reject is removed as closely as possible to the marked lines on the cake, the shovel is either driven down vertically from these lines to the floor or drawn from the top to the bottom at an angle approximating the angle of rest, the ore thus removed being added to the reject. Segregation of the particles will be most apparent at this point, and the thicker the cake the greater will be the difference between the sizes of the particles at the top and at the bottom. The workmen can not prevent the face of a cut seeking its angle of rest, and the result is that the finer particles at the top usually fall or are dragged into the reject space and are consequently swept up and carried away, a corresponding amount of coarser material being left in their place. Although this amount is not large, it may, with high-grade ore, cause a serious error.

With the open system, the workman can never be sure that he is taking from these division edges more or less than he should. He also has to exercise his judgment as to whether he should take all the fine particles that fall to the floor, or whether he should dip into the layer of coarse material that lies close to the floor. This error may be minimized by the use of the steel cross, as previously described. Whether the cross is used at the time of coning or for the quartering only, it is an improvement over the open system, and its general adoption is a matter worthy of consideration.

Throughout the whole operation, from the time that the ore is first dumped on the floor to the time that the reject quarters are removed, the tendency is to reject an excessive proportion of fine particles, thus leaving for each succeeding sampling a constantly increasing proportion of coarse material. This tendency can in a measure be overcome by alternately taking for the sample the ore in the usual reject quarters. Inasmuch as the first cone is the largest, its proportionate error, due to segregation, is probably greater than that of the succeeding cones. Therefore, whether the reject or the sample contains the greater proportion of fine particles depends on which one is removed in the first quartering. All operators do not recognize the importance of this segregation, and occasionally a plant permits the seller of a lot of ore to specify, during the sampling, which quarters are to be taken for the sample. Where this is done, an intelligent and attentive watcher may be of considerable value to his employer.

The custom noted in a few plants of removing additional slices from the sample quarters left on the floor, when these quarters are found to contain more ore than is desired for the final sample, and yet is too small to be again quartered, is of doubtful accuracy. If this slice is taken radially, there is less objection to it, but it is usually taken on a line parallel to the already marked radial edge, so that the proportion of fine material to coarse material is increased beyond the correct ratio.

Fractional Shoveling.

None of the plants examined used the fractional shoveling method of sampling exclusively, but all the plants using the coning and quartering method, and six plants in which mechanical methods were used in combination with hand methods use fractional shoveling at some point in their operations. It is more commonly used during the unloading of the ore in order to save the expense of passing an entire lot through the mill, or, if the ore is to be smelted, in order to put it on the beds in as coarse a condition as possible. Unquestionably it is a very convenient method, especially in unloading a lot of ore that has been previously crushed, or has been sampled at a custom sampling plant before its arrival at the reduction works.

Fractional shoveling has many advocates who claim for it greater accuracy than is possible with the coning and quartering system and offer figures to show close checking on samples and resamples. If, however, the ore has been coned or placed in a regular pile before shoveling, the same evident sizing exists and opportunities for careless or objectionable shoveling seem as great and, in certain instances noted hereafter, greater than in the coning method. Therefore, except for the convenience and possibly greater economy in handling, it offers little or no improvement over coning and quartering.

(To be continued.)

Large Sulphuric Acid Exports.—Sulphuric acid exports in June were 9,421,735 lbs., which is next to the largest month's total this year, the March exports having been 12,979,267 lbs. This brings the total for the half year to 43,739,427 lbs. or 7,289,903 lbs. per month. For the fiscal year ended June 30, 1916, the total exports were 82,020,246 lbs. against 46,771,510 lbs. and 12,131,750 lbs. for the fiscal years 1915 and 1914 respectively. The June exports were nearly equal to the total for 1913, of 9,689,005 lbs., while the March exports were very little short of the 13,176,175 lbs. exported in 1914.

Nineteenth Annual Meeting of the American Mining Congress

The 19th annual session of the American Mining Congress, which will be held at Hotel LaSalle, Chicago, during the week of Nov. 13, will eclipse in attendance and in interest all previous meetings, and represents a climax of the great work of co-operative purpose and endeavor of nearly two decades.

And that it will be an unparalleled success is due in a great measure to the unstinted efforts, both as to time and means, of the Chicago committee.

The entire 17th floor of Hotel LaSalle has been set apart for exhibits, and enough space has already been taken to assure a thoroughly representative display of all the interests associated with the Mining Congress.

The General Electric Co. promises an unusual display—the best it has ever made. Among others who have contracted for space on the floor are the following: The Link Belt Co., Goodman Mfg. Co., Stromberg-Carlson Co., John A. Roebling & Sons, Justrite Mfg. Co., G. L. Simonds Co., Tool, Steel Gear & Pinion Co. of Cincinnati.

The entire 19th floor of the hotel has been set apart for meeting rooms. In addition to this there will be several meeting rooms on the 18th floor and two on the 17th.

On Monday night Edward L. Doheny, of Los Angeles, will show the moving picture of the great Mexican oil gusher, Cerro Azul, and Dr. Henry Mace Payne will have an illustrated lecture on Mining Frozen Gravels of Alaska and Siberia. The slides will portray features of mining in the far north which have never before been shown.

H. L. Ameling, of St. Louis, will deliver a lecture illustrated by moving pictures on the use of the core drill. This will be delivered at one of the general meetings or at an evening session. It will show the drill at work, give pictures of the cores, explain in detail how underground areas are exploited for mining prospects, and will be a pictorial presentation of the revolution that this drill has worked in the labors of the investigating mining engineer.

On Tuesday evening there will be the general meeting for the election of officers and for the presentation of the regular reports.

On Wednesday evening there is to be a smoker, and on Thursday the annual banquet will be held in the banquet hall of the hotel.

The programs for the general meetings in the mornings and for the section meetings in the afternoons are nearly completed, with a sufficient number of acceptances to bear out the prediction that it will be a great convention. Nothing quite so far-reaching and so extensive in its scope has been attempted at previous conventions, and no coal mining, metal mining or oil man can afford to miss it.

It means that those who come will get into touch with those interested in their own branch of the mining or oil business, and with new and carefully tried out economies and means of greater productiveness.

The addresses of welcome from Governor Edward F. Dunne of Illinois, Mayor William Hale Thompson of Chicago, and President J. W. O'Leary of the Chicago Association of Commerce will be responded to by representatives of every oil and mining state in the union. These responses will, however, not be the

ordinary impromptu kind, but in every instance a carefully prepared 3-minute resolution embracing the state's most important mining issue. With such a consensus of opinion before it, the Resolutions Committee will be able to frame legislative demands which will synthesize the needs of the mining sections of the country.

At the general meeting Tuesday, the 14th, the subject will be "Safety." Van H. Manning, director of the U. S. Bureau of Mines, will have an address on "The Past and the Future of Mine Safety Work." J. F. Welborn, president of the Colorado Fuel & Iron Co., has promised to be present and will take part in the discussion. Others of great prominence will participate.

At the general meeting Wednesday the topic will be "Efficiency in Mining Operation." This promises to be an exceptionally interesting and instructive program. Colonel George Pope of Hartford, Conn., president of the National Manufacturers' Association, has consented to speak on the general topic: "Organized Capital and Organized Labor and Their Relation to Efficiency, Conservatism, Better Wages, Better Living Conditions, Lawlessness, Strike Disorders, and Industrial Freedom."

Secretary of Labor W. H. Wilson will be present to reply to Col. Pope if it can possibly be arranged. It is also the intention to urge Henry Ford of Detroit to be present and speak on the subject.

At this meeting Hon. E. N. Herley, chairman of the Federal Trade Commission, will speak on the subject of "The Federal Trade Commission and the Mining Industry." It was this commission which, through Mr. Herley, established a uniform system of cost accounting for the coal industry, and he will present for consideration his ideas of needed legislation as developed in the course of the commission's investigation.

Charles M. Moderwell, of Chicago, will present the report of the Committee on Relations with the Federal Trade Commission.

On Thursday the subject will be "Conservation," and among those who are to have papers is Senator Phelan of California. Hemen Jennings of Washington, D. C., will deliver an address on "The Accomplishment of Invention and Its Relation to Labor and Capital." Among the other topics of the day by experts will be: "Waste in the Mining Industry—in Mining, in Distribution, and in Use," the "Relation of Waste—to the Operator, the Consumer, the Public."

Friday the local reception committee will probably arrange an excursion to Gary where inspection will be made under the guidance of the steel company's experts.

The sections promise to be of unusual interest. The zinc and lead section opens in its own meeting room at 2 p. m. Tuesday, under the chairmanship of S. D. Nicholson of Denver. The principal address of this day will be by Otto Ruhl of Joplin, on the subject "A Tariff for Revenue as Related to a Compensating Duty on Lead and Zinc Ores." The discussion will be participated in by the leading men in this section.

On Wednesday in the zinc and lead section the report of the committee on Mineral Statistics will be

made. The topic for the day will be "Co-operation in the Zinc Industry." Addresses will be delivered on "The Marketing of Zinc Ores" by W. B. Shackelford, "The Importance of Zinc in Preparedness," by J. H. Troutman of Denver, and "Smelter Contracts and Market Quotations," by R. M. Henderson of Breckenridge, Colo.

On Thursday the Zinc and Lead section will hear the following addresses: "Lead and Zinc Resources of the United States," by C. E. Siebenthal, of the U. S. Geological Survey; "The New Things in Science," by F. G. Cottrell, of the U. S. Bureau of Mines. In addition to these there will be papers on "Conservation in the Zinc and Lead Industry of Present Day Importance," and a talk on "Flotation Processes" by Edward H. Nutter of San Francisco.

An interesting discussion will be led by H. C. George, manager of the Wisconsin Zinc Co., on the "Need of a Satisfactory Tariff on Ores."

The Precious Metals section will begin its discussions in its own assembly rooms Tuesday, the 14th, at 2 p. m., Irving T. Snyder of Cripple Creek, presiding. On the opening day of this important session Senator John F. Shafroth of Colorado is to talk on "The Future of Silver," Dr. Waldemar Lindgren of Boston is to speak on "The World's Gold Supply and Its Sufficiency for Business Needs."

On Wednesday in the Precious Metals section the addresses and discussions will be on these topics: "The Best Industry of the Rocky Mountain West," by T. B. Stearns, president of the Denver Civic Association; "How to Protect the Small Investors in Metalliferous Mines," by W. R. Allen of Butte, Mont.; "Does the Smelting Business Partake of the Nature of a Public Utility?" "Should Independent Ore Producers Co-operate in Providing Treatment and Marketing Facilities?"

On Thursday, with D. W. Brunton of Denver presiding, the committee on Revision of Mineral Land Laws is to report to its chairman, E. B. Kirby. At this meeting will be an address on the "Foster Bill" by Congressman M. D. Foster of Illinois, chairman of the House Committee on Mines and Mining. Horace V. Winchell of Minneapolis is also to speak on this topic. The discussion promises to be warm and interesting.

The Oil section in its own assembly rooms opens for business at 2 p. m. Tuesday, Ralph Arnold of New York presiding. Three addresses, which will all be open for discussion, are as follows: "The Oil Resources of the United States," by W. A. Williams of the U. S. Bureau of Mines; "The Authority of States to Tax Production from Indian Lands," by Judge J. G. Gamble of Des Moines, Ia., and "The Public Interest in Gas and Oil."

On Wednesday in the Oil section E. L. Doheny of Los Angeles presiding, the opening address will be by Ralph Arnold of New York on the subject "The World's Oil Supply." Dr. Rittman is to speak on "Chemistry in Its Relation to the Oil Industry," and J. C. McDowell of Pittsburgh will have an address on "Geology in Its Relation to the Oil Business."

On Thursday with S. Y. Ramage of Oil City, Pa., presiding, the addresses are to be on "The California Plan of Marketing Oils," by George Lane of Los Angeles, and "A Federal Petroleum Bureau," by H. G. James of Kansas City, secretary of the Independent Oil Refiners' Association.

The Coal section opens in its own assembly rooms Tuesday, the 14th, at 2 p. m., Chas. M. Moderwell of Chicago presiding. S. A. Taylor will present a

report of the committee on "Uniform Accounting Cost System," and Dr. F. C. Honnold of Chicago will lead the discussion. S. H. Robbins, president of the Pittsburgh Vein Coal Operatives, Hugh Shirkie of Terre Haute, and T. L. Lewis of West Virginia, are all to have something to say on this subject. Promptly at 3:30 p. m. the report of the committee on "Workmen's Compensation" will be presented by T. L. Lewis, and this will be followed by an address on "The Distribution of Coal in Cities."

On Wednesday, with Dr. I. C. White of Morgantown, W. Va., presiding, there will be an address on "The Colorado Industrial Commission," by Wayne Williams of Denver. An effort is now being made to induce John D. Rockefeller, Jr., to be present and to address the convention on "The Rockefeller Plan" or on a kindred topic. Dr. S. D. Warriner of Philadelphia is to have an address on this day on "The Closed Shop and the Check-off as Related to Efficiency in Mining Operations."

On Thursday in the Coal Section, with J. C. Kolson of Terre Haute presiding, the principal address is to be on "Co-operation—the Great Necessity in Bettering Coal Mining Conditions, and the Means of Its Accomplishment," by President Carl Scholz. A discussion of "Ways and Means" is to follow this address.

James F. Callbreath, Secretary of the Congress, is now on a trip to Colorado and Utah, where big meetings are to be held and interest aroused in this epoch-making 19th annual convention of the American Mining Congress.

Among those whose addresses will be notable either in the sections or in the general meetings, are the following, to which titles have not yet been received, but definite assurances of attendance and participation are at hand. These are in addition to the names already mentioned in connection with the meeting: Judge George H. Patrick of Washington, D. C.; Dr. A. H. Perdue, State Geologist, Nashville, Tenn.; Dr. David T. Day, Geologist, Washington, D. C.; W. R. Allen of Montana, Mine Operator and former Lieutenant-Governor; Walter Harvey Weed of New York; Theodore F. Van Wagenan of Denver, Colo.; W. A. Lyon of Salt Lake City, Oil Flotation Expert of the Bureau of Mines; C. A. Tupper of Illinois, of the Mining and Engineering World; R. B. Moore of Denver, rare metal expert, Bureau of Mines; Fred Laist of Montana, Chemical Expert, Anaconda Copper Co., and Otto Kahn of Kuhn, Loeb & Co., who will probably deliver a special address on the "Conservation of Capital."

Silician Sulphur Production.—The latest official statistics of the production of sulphur is given by the Sicilian Sulfur Consortium for February, 1916. Production shows a marked decline, while sales, on the other hand, exceed those of February, 1915. The production for February was 16,865 metric tons as against 24,799 for the corresponding month of 1915, while shipments for the month were 53,023 tons as against 35,121 in 1915. There were marked increases in the exports this year to the following countries: France, Great Britain, Greece, Turkey, Spain, Portugal and South America. Stocks in hand at the end of February were 258,766 tons as against 365,330 tons last year, being the lowest for sulphur stocks in Sicily since the consortium took over the industry.

The most refractory clays are those containing an excess of alumina.

Conditions Governing Mining in South America

BENJAMIN LE ROY MILLER and JOSEPH T. SINGEWALD, JR.*

Having just returned from a 23,000 mile trip through South and Central America, where most of the important mining districts of Brazil, Chile, Bolivia, Peru, Costa Rica and Cuba were visited, the writers feel that certain impressions gained on the trip may be of some interest to members of the mining profession, and so yield to the request for a brief discussion of the mining conditions in the southern continent. In addition to the countries mentioned, Uruguay, Argentina, Ecuador, Panama and the islands of Barbadoes and Jamaica were visited, but these countries are mainly agricultural, and their less extensive mineral deposits are as yet poorly developed.

The most prominent feature which attracts attention in visiting the mining districts of Latin-America is the extensive investment of foreign capital. It is only a slight exaggeration to say that, at the present time, all the largest mining enterprises have been developed by foreigners. This condition which is not at all peculiar to South America, but has been seen in the development of the resources of other new countries, is at the same time a blessing and a curse to the countries concerned. In comparison with the nations of Europe and the United States, the South and Central American republics are poor and incapable of developing their own resources without the assistance of the wealth of the other countries.

The two great gold mines of Brazil, the largest copper mines and most of the nitrate oficinas of Chile, the principal tin, silver, bismuth and copper mines of Bolivia, the copper, coal and vanadium mines of Peru, the gold mines of Costa Rica and the iron and copper mines of Cuba, all owe their development to the introduction of foreign capital. Without such assistance most of these mines would at present be idle, or worked only in a very small way. The regions where these mines are located have been improved by the building of wagon roads and railroads, by the betterment of the conditions of living and by the higher remuneration for the native laborers.

In every country of South America one finds a large class of people who welcome the introduction of outside capital in the development of their mineral resources and also an equally large class who are antagonistic.

Some of the foreign companies attempted to evade the legitimate taxation for the support of the government which they by right owed, while government officials have at times attempted to force the foreign companies to pay for more than their just proportion of the country's revenues. Difficulties of this kind have by no means ended, for increased export taxes on ore and metals are being advocated in several of the Latin-American countries. Yet, on the whole, there are favorable indications that satisfactory and equitable adjustments will be arranged in the future. Without exception the leading men in the various countries seem inclined to welcome foreign capital, realizing its benefits in the development of their countries, and thus do not favor excessive taxation. Reasonable or even large profits of foreign companies are not necessarily looked upon by the government officials with disfavor, provided the companies do not

try to evade the payment of their proportionate share of the expenses of the government.

In comparing the mines owned by foreign capital in the Latin-American countries with those owned by the people of those countries, one notes great differences. Although there are a few exceptions, in general the equipment of the foreign owned mines is infinitely superior to that of the mines owned by local capital. The equipment of the latter class may be valued at hundreds of dollars, while that of the former at tens or even hundreds of thousands of dollars. The investment by some foreign companies of millions of dollars in the development of certain mines before a pound of ore has been shipped has been a most beneficial object lesson to the people of several regions.

The wisdom of the expenditure of large sums of money for the gain of much larger amounts is gradually being recognized, and the extension of such a policy cannot fail to materially increase the development of the mineral resources.

In the past, mining in South and Central America was mainly confined to the development of small mines containing high-grade ores. If bonanza ore bodies were encountered, the profits were invested in other mines or other industries; and, when the rich ores were exhausted, the mines were abandoned. Chile, particularly, contains hundreds of examples of this type of mining. The foreign companies have, however, indicated the better system with the result that ore deposits of much lower grade are now being worked and the mining profits are both greater and much more regular. If foreign companies had done nothing more for the countries where they operate than to point out better methods of conducting mining operations, they should still be regarded as of supreme importance to the Latin-American countries.

The problems which confront a mining company in South America are many and great, whether the mine be located in the tropical region of Brazil or in the high Andes. The greatest of these is the labor question, for it can be said of very many of the mining districts that the native laborers are poor, and tact and patience without limit are requisite qualifications for the successful mine managers. The drink and holiday habits are almost universal. Other companies might well follow the example of the Braden Copper Co. in the construction of a liquor fence, as the elimination of about nine-tenths of the holidays would materially increase the efficiency.

There is scarcely a mining region in South America where the supply of satisfactory laborers is not deficient, except when financial depressions occur and other industrial operations cease. The attempts to obtain laborers from other sections have not met with much success. Two instances may be cited to illustrate some of the difficulties encountered.

A few years ago the St. John del Rey Mining Co., which operates the Morro Velho mine in Brazil—the mine which at present holds the world's record for depth, the lowest working being 5824 ft. below the surface—imported 100 Japanese laborers at great expense. Within a few months every one had deserted, in spite of the fact that unusual care had been taken for their comfort. A mining company operating in Potosi mountain, Bolivia, had similar experiences in

*In Tentente Topics.

their attempt to bring Indian workmen from lower countries. The altitude of the mines, about 15,000 ft above sea level, affected the workmen, unaccustomed to these elevations, to such an extent that the men soon returned to their homes. In the sulphur mines of northern Chile, Bolivian Indians can be obtained for short periods, but as soon as they obtain enough money to purchase a good supply of coco leaves and some necessary provisions, they return to their home on the "altiplanicie." In general the importation of laborers from other countries has met with failure, and each section must furnish its own supply, which means that at times many of the companies must be short of labor.

In comparison with those of the United States, the mines of South America present a striking contrast in their equipment. Remote from the sources of supply, each mine must carry large quantities of necessary articles and must also depend mainly upon its own resources.

In the well-managed machine shops, which are so essential to the success of any company, many most ingenious devices have been invented as "necessity" continues to be "the mother of invention." Few, if any, mining districts in the United States have to their credit as many new and useful inventions and appliances as have been developed in the mining section of South America. When 4 to 6 months are required to get new supplies from the factories in the United States or Europe, the ingenuity of the men in charge is frequently taxed to the utmost, and illustrations of this condition were found in almost every mining camp.

In adjusting mining methods to environment, some unusual materials must be employed. These are to a North American most unique in the character of the fuel used in some of the mining camps of Bolivia and the elevated regions of northern Chile. In many mining sections the only fuel obtainable is taquia, and this is used for all purposes as a substitute for the more common kinds of fuel. It is perhaps natural that one should at first feel some disgust in having his food cooked with such fuel, but this seems less incongruous than the use of the material for the production of steam, for drying ore concentrates, for roasting ores, as well as for a great variety of other purposes. With a fuel value equal to about one-third that of ordinary bituminous coal, it makes a fair substitute, and is so much in demand that not only is it collected from the corrals where the llamas are herded at night, but Indian women can frequently be seen gathering it along the roads and trails used by the llama trains. One mining company in Bolivia uses 10,000 tons of taquia yearly and would like to be able to purchase more.

In other sections, a plant, called *yareta*, which resembles a huge lichen or fungus, grows on rocky slopes at elevations of 13,000 to 16,000 ft. above sea level. Because of the great amount of resinous matter contained in its woody tissues, this makes an excellent fuel. It grows upon rocks and conforms to their surface, resembling in shape heads of coral growth. Some of the masses are as much as 4 ft. in diameter and are 1½ ft. in thickness, and, when pried off the rocks and allowed to dry in the sun, burn readily and furnish a large amount of heat. A number of mining districts use no other fuel, and it is verily a Godsend, as the high cost of imported fuel at such elevations would practically render its used prohibitive. There is no doubt but that a number of mines in the high Andean plateaus could not be operated were it not possible to obtain supplies of these two unique and interesting types of fuel.

Loading a Pig Iron Freighter with Lifting Magnet.

The accompanying illustration shows the new magnet application made at Ashland, Wis., on the freighter *Cicoa*, which made the first loading of pig iron by means of these lifting magnets, designed at Milwaukee, Wis. This is said to be the first lake freighter to carry its own electric lifting magnets for loading pig iron, and although electro-magnets have been in use at ore docks a number of years for unloading pig iron, the loading has always been accomplished by longshoremen.

The successful and economical performance of magnets when unloading convinced the Charcoal Iron Co. of America that a similar means of loading would be of equal advantage, so that after buying the lake freighter, the *John Sharples* and renaming it the *Cicoa*, it was fitted up with circular magnets of 36 in. size, and they were first used for taking on the cargo at

LOADING PIG IRON AT ASHLAND, WIS.

the Ashland dock. The powerful magnets swing out over the dock from the crane and as they near the pile of pig iron the pigs fairly jump toward the magnet and are carried away to be dropped when the operator throws off the switch. The boat's crew store the iron in the hold.

Capt. James H. Gallagher said that the entire cost of taking on the cargo of 4,000,000 lbs. (2000 tons) was only \$100. The cost of loading with longshoremen would have been \$500 to \$600.

With all three magnets working the net weight of pig iron lifted from the dock is 4500 lbs. The *Cicoa* is utilized exclusively in carrying pig iron from the docks at Ashland, Manistique, Boyne City and Newberry, Mich., to Buffalo.

The railroads of the United States used 128,200,000 net tons of coal in 1915, or 24% of the total output. The bituminous mines furnished 122,000,000 tons, or 28% of their production, and the Pennsylvania anthracite region 6,200,000 tons, or 7 per cent its production. The roads in the eastern district, north of Potomac and Ohio rivers and east of Chicago, Peoria, and St. Louis, used 56,500,000 tons of bituminous coal and 6,200,000 tons of anthracite, a total of 62,700,000 tons. The roads of the southern district, south Potomac and Ohio rivers, and east of the Mississippi, used 22,000,000 tons of bituminous coal, and the western roads consumed 43,500,000 tons.

The Canadian Nickel Problem.*

The following article was published as an editorial in the Montreal Gazette, of Aug. 23. Of late so much that is imbecile has been printed in Canadian newspapers on the "nickel question" that a sensible presentation of facts, although they should be obvious enough to any one who has given any thought to the subject, comes as a welcome relief. As the Gazette remarks there is no "nickel problem." The desirability of providing for the refining of nickel in Canada has been realized. Arrangements have been made to that end. Effective measures, satisfactory to the British War Office, have been taken to prevent Canadian nickel reaching the enemy. This is all that need or can be done until, at least, the Commission appointed by the Ontario Government has submitted its report. On this report no doubt such matters as the most suitable location for a refinery and other details will be determined. The article referred to reads:

"The nickel problem has been the subject of much discussion of late, and in the recent Toronto by-election it was frequently thrust to the fore. No one who deals with it seems to have a clear idea of what the problem is. This fact may account for some of the extraordinary suggestions advanced, action on which would result in the stopping of the mining and smelting industry in Canada. Nickel is not a new metal. For over a century it has figured in the arts, the Germans, after the Chinese, being leaders in separating it and turning it to account. Canada has no monopoly of it. New Caledonia produces it in large quantities. It is found also in South Africa, Norway, Sweden and Finland, Greece, Cuba, and in Pennsylvania and Missouri in the United States. The Canadian and New Caledonia deposits are so great in extent and so superior in other ways that they have become the source of supply of the world. The story of the Canadian industry is simple. As long ago as 1856 men in the service of the Canadian Geological Survey noted the presence in the Sudbury district of a mass of rock which caused a disturbance of the magnetic needle. Dr. Sterry Hunt, one of the leading authorities of his day, on examining a sample found that it contained nickel and copper. Engineers in the construction service of the Canadian Pacific railway noted the peculiarities of the materials with which they had to deal. One of the cuttings disclosed what later became the property of the Murray mine. Many other deposits were noted, and a number were taken up as copper propositions. Some thousands of tons of ore were shipped from Copper Cliff before the value of the nickel contents was known. In the course of events, growing out of experiment, failure and success, a number of companies became prominent. Chief of these was the Canadian Copper Co., which was incorporated into the scheme of the International Nickel Co., described as a consolidation of mines and smelters in the United States, Canada, Great Britain and New Caledonia. The result of the introduction of new capital and more efficient methods was a large development that added to the business of the region concerned. Other companies were formed and operated. They took out the ore, smelted it so as to produce a matte containing copper and nickel. This was refined, some in New Jersey and some near Swansea in Wales. These facts are summarized from a report on the industry made for the Department of Mines of Canada. They show that the industry had an ordinary experience. The properties bearing ore were acquired under the law. There were failures. Some who had means and perseverance mastered the secret of separating the nickel and the copper, which involves a lengthy and complicated chemical process. Then it was discovered that nickel could be used to harden and strengthen steel. It was sought for armament work, by automobile makers, for ornamental work, and for casing bullets for use in military rifles. The product of the mines and smelters after being refined in New Jersey and Wales, went upon the world's markets. If it had not gone on the world's markets the quantity produced would have been of small account.

*Canadian Mining Institute Bulletin.

Canada's use alone would not keep a smelter going. The metal was like any other merchandise, like copper, or iron ore, or wheat, or cotton, or any of a hundred articles that are used for military services, but that find their great usefulness in the arts and purposes of peace. With some at least the problem seems to be to prevent the restoration of this simple and natural order after the war. There is no practicable or desirable way of gaining such an end. If there was such a way it would be doubtful if any one would seek to use it. When these bald facts are seen and recognized the nickel problem disappears. There appear to be some, however, who do not want the facts realized. Their zeal seems to have some connection with a scheme for getting taxpayers' money to enable them to make a profit in a business that others pursue without such unwholesome aid. This, however, is not a problem so much as it is a treasury raid."

Concentric Ore Crusher.

An ore breaker of high capacity and one in which, incidentally, the breaking elements are so opposed as to prevent reaction of the breaking pressure across the bearing surface, is embodied in an invention of Thomas W. Capen of Milwaukee, Wis., which has been assigned by mesne assignments to the Allis-Chalmers Co. of the same city.

The vertical, central section shown herewith gives a clear idea of the arrangement of the parts and their operation. The lower part consists of the frame proper, containing the step and ring bearing for the vertical shaft of the machine. The upper end of this shaft carries the crushed roll element. This roll is

A NEW CONCENTRIC ORE CRUSHER.

shaped like two diametrically opposed segments of a sphere, and is mounted concentrically on a horizontal shaft as shown. This horizontal shaft is turned by the star wheel at the left, the arms of which engage pins set all the way around the circumference of the frame. Ore is fed into this roll through a hopper shown at the top.

As the vertical shaft is revolved, the ore in the crusher roll is thrown outward by centrifugal force. At the same time, the star wheel is constantly revolving the roll, which, being set concentrically within the annular casing, crushes the ore against the latter.

Month's Record of a Dreadnaught Rock Drill.

LETSON BALLIET.

Owing to the fact that the Buckeye Belmont Mines Co., Nevada, was repairing chutes it was possible to work only one crosscut during August, which allowed but one drill to be in operation during the month. This gave them an excellent opportunity to prepare some drilling data on the operations of the drill:

Conditions.

Elevation above sea level 6200 ft. at surface.
 Depth of shaft 1200 ft.
 Four-inch air line down the shaft.
 Drill worked 1250 ft. from the station.
 Level piped with 1¼-in. pipe line.
 Gauge pressure 100 lbs. maintained at surface.
 Compressor is motor-driven through belt transmission.
 Compressor—Sullivan angle-compound, equipped with unloaders.
 Efficiency of compressor 5 cu. ft. per horsepower.
 Drill operated 31 shifts during the month.
 Average atmospheric temperature 78°F. on surface at 2 p. m.
 Relative humidity average 20% on surface at 2 p. m.
 Natural rock heat in working face 104°F.
 Formation trachyte.
 Number holes to break a round, 11. Average depth 5 ft.
 Total feet of holes per day 55, and 1705 ft. during month.
 Drill Dreadnaught water feed, hammer drill.
 Total number cubic feet of free air compressed, 705,900.
 Average number of cubic feet per day, 22,771.
 Average number cubic feet per minute, 130.
 Compressor was started, after drill was set up.
 Compressor was stopped while the bar was being lowered.
 Compressor was started again when lifters were ready to drill.
 Compressor was stopped when drilling was finished.
 Compressor motor was driving compressor 90½ hours during month.
 Average daily time compressor was running 2 hours 55 minutes.
 Shortest time compressor run any one day 1 hour 45 minutes.
 Longest time compressor run any one day 3 hours 45 minutes.
 While compressor was running 18 hours in the aggregate was lost-time, changing steel, shifting machines, getting water and oiling, shown on recording gauges.
 Compressor motor used 1820 kwh. on the meter, during the 90½ hours (5430 minutes) it was in motion.
 Drill sharpener and forge included in compressor operations.

set up on a tunnel bar over the muck and mucker helped with the set up, then mucked out behind and under him. By the time the bar was ready to lower, mucker had cleaned out and was ready for him. If not ready the driller helped muck back.

Average time that the driller and muckers were under ground (from collar until they were hoisted over the collar) was 7¼ hours per shift.

The result of these figures shows that a foot of drill hole was made every 3 minutes, or 4 ins. every minute that the compressor was in motion.

Inexpensive Ore Mill for Light Work.

This ore mill is simple in construction and inexpensive to build and install. It is designed on the principle of a swinging mortar, and will do the work satisfactorily where the requirements do not call for an elaborate equipment.

A pan or mortar is suspended by rods so as to swing back and forth like a hammock. In the pan is

AN INEXPENSIVE ROCK CRUSHER.

a roller or crusher consisting of a hard steel shell mounted on a cylindrical core, which rolls in the pan as the latter is swung by a crank.,

The shell of the roller has one side cut down flat

Drill repairs and upkeep—Nothing.					.0000902

Blacksmith shop did no work except to sharpen steel for this drill that was running. Drill sharpener and forge fire were operated by compressed air. Steel was sharpened when drill was calling for air in the mine, thus compressor was not run for any purpose except while drilling was being done. The blacksmith shop was charged to the drill, and it must be remembered that all mechanical friction of the compressor and motor loss is charged to this drill. If other drills had been working the motor loss, friction and shop air would have been averaged between them, making the cost per drill somewhat less.

The drill was worked as "a one man drill." It was

as shown, so that the roller as a whole is heavier on one side, causing it to come back readily to the center of the pan, when the latter is at the lowest part of its swing. This construction of the roller really facilitates the swinging of the pan.

In the bottom of the pan is an adjustable screen by means of which the depth of the ore pulp is governed, and the latter is fed in automatically through the bent pipe which appears in the illustration. Jacob Lampert of Rapid City, S. D., is the inventor.

Don't kid about "Safety First"—you may be the goat.

What the Mining Companies are Doing

Jumbo Extension Co., Nevada.

Details of production and costs are given in the report of the Jumbo Extension Mining Co. for the year ended June 30, 1916, as follows:

Production, smelter recovery.....	\$970,784.55
Dump (mill) ore.....	882.35
Total recovery	\$971,666.90
Expenses—	
Mining	\$103,480.28
Development	88,445.32
Freight, treatment, sampling on ore shipped.....	329,145.63
General expenses	21,596.65
Marketing ore	1,650.00
Taxes	12,066.45
Total operating expenses	\$556,384.33
Construction, equipment	6,041.61
Net operating costs, including construction, freight, treatment and sampling on ore shipped.....	\$562,425.94
Net realization	409,240.96

REPORT OF SECRETARY.

Cash balance, June 30, 1915.....	\$120,533.13
Receipts—	
Received from ore sales.....	685,874.47
Interest	400.00
Jumbo Reduction Co., on account.....	1,811.62
	\$808,629.23
Expenditures to June 30.....	\$233,280.31
Dividends	465,100.00
Cash balance June 30, 1916.....	103,274.38
Addition to stores	6,974.53
	\$808,629.22
Net value of ore in transit and unsettled for June 30, 1916	\$ 28,728.30

Shannon Copper.

By Jan. 1 Shannon Copper Co. should be in position to resume dividends, which were discontinued with the payment Jan. 30, 1913, of 50 cts. per share, as the company is now earning between \$2 and \$3 per annum. At the present time net current assets amount to over \$1,000,000, but there is about \$240,000 to be deducted from this, \$183,000 to retire outstanding bonds of Shannon-Arizona Railway and the balance to meet payment on a property purchased many months ago. By Jan. 1, however, net quick assets should again have crossed \$1,000,000, which would be more than ample for all purposes.

Directors are very desirous of retiring the \$183,000 Shannon-Arizona Railway bonds which can be called on any interest date at par and interest. The Shannon Copper Co., which guarantees them is, however, prepared to purchase them now on the same basis at which they are callable.

The company reports for 6 months ended June 30 a production of 4,376,199 lbs. of copper, cost of 17.2 cts. per pound with net earnings for 5 months—property being closed in January—amounting to \$448,396. Deducting January expenses of \$14,175 net from 5 months' operation was \$434,220. Company received 27.363 cts. per pound for its copper.

Phelps, Dodge & Co.

New high record earnings and production have been established this year by the operating subsidiaries of Phelps, Dodge & Co., which have resulted in greater dividends than ever before on this stock. With the payment this month of \$8 per share there will have been distributed in the first three quarters of the year a total of \$20 per share requiring the disbursement of \$9,000,000. Owing to the well sold-up condition of the company at high prices it appears likely that the December distribution will at least equal, if not exceed, the September payment of \$8 a share.

It is estimated that Phelps, Dodge & Co. produced during the first 8 months of this year approximately 115,000,000 lbs. of copper, a big increase over last year's total for the same period. In addition, the sales department had the marketing of Calumet & Arizona production of close to 45,000,000 lbs. for the eight months.

It would not be surprising if the Phelps-Dodge produc-

tion reached 175,000,000 lbs. for the entire year against 140,000,000 lbs. in 1915. Assuming a 10-ct. cost and 25-ct. copper, profits should reach \$26,250,000, equal to \$58 per share on 450,000 shares of Phelps-Dodge stock.

Miami Copper, Arizona.

Miami, with a half-yearly production of approximately 28,000,000 lbs. of copper and a cost of about 9 cts., will show earnings around \$4,700,000, or better than \$6 a share. With a continuation of present attainments Miami stands to earn in 1916 between \$10 and \$11 per share, and as it has to date paid out but \$4.25 in dividends there is reason to hope that the dividend due in the middle of November may be increased. With no large construction expenses ahead and net working capital of over \$5,000,000, practically every cent of earnings is applicable to dividends.

The Miami mill now handles 4500 tons of ore daily, or upwards of 1,350,000 tons per annum. Present development warrants the statement that in high-grade ore alone the company has 12 years' life, while considering its complete reported tonnage of ore reserves of 35,000,000 tons of 1.82% material and 6,000,000 tons of 2% mixed ores Miami has more than 20 years' life in ore blocked out, the time beyond 20 years being indefinite as it will depend very largely on the treatment of the very lowest grade of ore, the method of which is yet to be determined.

The management is good, J. Parke Channing being consulting engineer. Greater efficiency is being secured from the mill than formerly through internal readjustments, and this has resulted, without increasing tonnage handled, in increased production. When it is decided how to treat the low-grade ores production is expected to get up to 60,000,000 lbs. of copper a year.

Based on its earning capacity Miami is selling too cheap, as the company is paying dividends at the rate of \$6 per annum and selling at \$37, which yields an income of 16%.

The company has an authorized capital of \$4,000,000, consisting of 800,000 shares of \$5 par value of which 747,114 shares have been issued. Miami was developed, financed and brought out by the General Development Co., Adolph Lewisohn being president of both companies. General Development is furthermore the largest individual stockholder with 25,000 shares in its name.

Federal Mining & Smelting.

The Federal Mining & Smelting Co. reports for the quarter ended July 31 as follows:

	1916.	1915.	Dec.
Total profit	\$332,291	\$356,126	\$23,832
Depreciation	64,007	65,235	1,228
Net profit	268,287	290,891	22,604

Tennessee Copper.

The Tennessee Copper Co. has entered appearance through Vogel & Vogel, of 15 Broad street, to four suits commenced against the company by W. H. Stiner & Son. These suits are for claims aggregating \$980,853 for breach of contracts entered into with Tennessee Copper Co. for delivery to Stiner & Son of 1000 tons carbolic acid crystals, 3500 tons sulphuric acid, 850 tons carbolic acid crystals, and 5000 tons of sulphuric acid, respectively. In the complaints Stiner & Son say that deliveries have not been made according to contract and that they have sustained damage by reason of the non-delivery to the extent claimed.

Attachments against the property of Tennessee Copper Co. in New York were issued, but these attachments were afterward vacated upon bonds being furnished by National Surety Co., in satisfaction of the attachment.

Several other suits against Tennessee Copper Co., alleging breach of contract, have been commenced and are pending in the Supreme Court of New York state. Armstrong & Keith of 4 Wall street have a claim of \$100,000 against the

Tennessee Copper Co., on behalf of the Nitrogenous Chemical Co., of Philadelphia and New York, claimed as damages for alleged breach of contract. Joline, Larkin & Rathbone have filed suit on behalf of Howard F. Bertine against the Tennessee Copper Co. for \$45,669 for alleged breach of contract entered into on Dec. 13, 1915, with the Diamond Alkali Co. for 625 tons of solid caustic soda.

United Verde Extension.

The United Verde Extension Co. is slated to produce this year better than 25,000,000 lbs. of copper, at a cost of between 7 and 8 cts. a pound. Assuming that it receives 25 cts. a pound for its product profits should approximate \$4,250,000, or \$4 a share on its 1,050,000 outstanding shares.

It is understood that recent development work at the property has added greatly to reserves estimated last July at 600,000 tons of 16% ore. At the 1400-ft. level, where the work centers, the ore body is 350 feet long and 250 feet wide, ore averaging 15% copper.

From this level a raise for more than 100 ft. has been in 15% ore all the way, while a winze from that level has been sunk more than 90 ft. in the same grade of material.

It is believed that the company will erect its own smelter so that it will not be forced to pay tolls to custom plants. Such a plant will also permit increased shipments as warranted by the further opening of the mine.

August Copper Figures.

During August American copper producers generally increased production over the previous month. Production figures of some of the companies are given as follows:

	August.	July.
Miami	4,698,795	4,310,000
East Butte	1,849,120	1,893,120
Anaconda	28,800,000	28,200,000
Inspiration	11,450,000	11,300,000
Kennebecott	10,200,000	10,750,000
Old Dominion	3,600,000	3,852,000
Greene-Cananea	5,000,000	4,600,000
Arizona Copper	4,800,000	4,400,000
Chile	3,020,000	3,574,000
Shattuck-Arizona	1,699,575	1,397,445
Utah	20,000,000	20,300,000

United States Smelting.

It is expected that the final quarter of the year will see operations back to normal for the United States Smelting & Refining Co. With silver selling around 68 cts. per ounce, and copper, zinc and lead stronger, it is difficult to see how the company can fail to earn \$24 a share on its common for the full year.

There is nothing new in the company's affairs. The big silver sensation that started the stock on its rise from \$50 has proved to be all that has been said of it and when conditions across the border right themselves the new vein can be counted upon for 10,000 tons of ore a month. On the present 68-ct. silver market this would represent silver earnings of about \$3,400,000 in excess of normal, or pretty close to \$10 a share for the common.

The operations, however, in the bonanza Real del Monte and in the Pachuca districts as well must have been hindered in recent weeks by the difficulty in getting cyanide across the border. As approximately 90% of the company's silver values and 96% of the gold are extracted by the cyanide process and by concentration, the lack of cyanide is obviously bound to slow up output.

For this reason mainly, and as silver has averaged a full two cents lower thus far this half-year than for the second quarter of the year, earnings will probably show some falling off during the current three months. The first quarter showed over \$2,600,000, the second rising \$3,000,000 and the third will probably not show over \$2,000,000.

For the nine months the company should show a balance for the common of between \$18 and \$20 as against \$2.75 thus far distributed in dividends. Directors would therefore be amply justified in paying a liberal extra or in placing the stock upon a \$5 basis, which a certain section of the board favors, but until the Mexican situation is definitely straight-

ened out and normal transportation facilities furnished, no change will probably be made in the current rate.

Miscellaneous Company Notes.

The Anaconda Co. has taken up its option on the Douglas group of zinc mines in Coeur d'Alene district. A big deposit of high-grade zinc ore has been developed on the property. Anaconda has also acquired the Silver Cable, another zinc property in that district.

Reports from Alaska Gold show marked improvement, for during the first 10 days of September the average headings of the ore was \$1.51 per ton. The preceding high average for a month's run was \$1.42—in January last. Furthermore, the tonnage treatment is being expanded, as during this 10-day period 50,510 tons were milled, an average of over 5000 tons per day.

Braden's production in the first 7 months of 1916 showed a substantial increase over that of 1915, registering an output of 25,970,000 lbs., as compared with 18,128,000 lbs. during the same period in 1915. The official explanation of July's low production is: "Mill started July 10, having been down since June 14 for repairs to tailings dam, which went out the latter date. As weather was cold and dry, the water was low and damage slight. Repairs completed and property now operating."

The American Smelting & Refining Co. has made an appropriation for the enlargement of its lead stacks at Murray, and copper furnaces at Garfield, Utah. The entire appropriation for this improvement is said to have been between \$2,000,000 and \$3,000,000. Utah Copper Co. has notified the Garfield Smelting Co. that it will be prepared to make larger shipments as quickly as the smelting plant can be enlarged. In the meantime the Utah Copper Co. will arrange to store some of its concentrates.

Owing to necessary repairs to the shaft during the month of August, operations at the Butte & Superior were interrupted and production fell from 16,000,000 lbs. of zinc in concentrates, which it had been running, to 10,000,000 lbs. The milling performance, however, was quite up to that of the previous month, with a recovery of over 94% and the product running 52.4% zinc. Very good progress is being made in the new shafts, and with these completed in a few months more similar interruptions in the future should not again take place.

It now appears that larger dividend disbursements are in sight for Nipissing stockholders. Directors next meet Sept. 25. The company now has \$2,000,000 cash assets. The company has been paying regular dividends of \$1 per annum, or 20% on a par of \$5, and has to date paid the stockholders nearly three times the capital stock of \$6,000,000. This year Nipissing should earn close to \$2,000,000. Production has not been increased, the gain coming almost entirely from the higher silver market. Operations last month resulted in estimated profits of \$218,750.

Another of Calumet & Hecla's subsidiaries has entered the dividend-paying list, with a \$1 declaration payable Sept. 21. The company is producing at the rate of about 3,500,000 lbs. of copper per annum at a cost of less than 13 cts. per pound, so with the red metal at its present price, earnings are over \$400,000 per annum, or better than \$4 per share on the 100,000 shares outstanding. We figure that earnings for the first 8 months of the current year were \$220,000. As the company had "balance of quick assets" on Dec. 31 last amounting to \$216,000, this item probably stood at better than \$400,000 on Sept. 1.

It is estimated that the Arizona Commercial Copper Co. is now able to earn \$50,000 per month with copper above 25 cts. a pound. This is based on the record of the past 7 months, in which was produced over \$350,000 net, or an average of \$50,000 a month. The date of the company's dividend payment has not yet been determined. Assuming that \$2 per share per annum were paid, it would not be necessary to draw upon the company's present working capital which now stands at better than \$600,000, which total has been reached after paying over \$100,000 for the power plant and the installation of pumping equipment on the fourteenth level.

Permissible Explosives and Electric Firing.

During the summer months, mine operators are interested and have more time to consider the introduction of new methods and improvements in their mines toward a betterment of working conditions.

What better improvement could be made than to install and adopt the electric method of firing explosives instead of the old method of fuse and blasting cap? It is true that in most of the modern and up-to-date mines electric firing and the use of permissible explosives have been adopted. There are a few, however, still lagging behind. Very few mines exist in which conditions could not be made more safe and the protection of the property enhanced by the use of permissible explosives and electric firing.

According to statistics compiled by the Bureau of Mines there were slightly more than 288,000 lbs. of permissible explosives used in American mines in the year 1903, and the fatalities during that year directly traceable to explosives, were 0.339 per 1000 men employed.

In 1914 over 15,000,000 lbs. of permissible explosives were used and the fatality rate dropped to 0.096 per 1000 men employed. A reduction of 72%! Again in 1870 there were 13.47 fatal accidents for every 1,000,000 tons of coal mined in this country and in 1914 only 4.78 for every 1,000,000 tons mined.

This great reduction was accomplished in spite of the fact that the production of coal has increased by several hundred per cent during that interim and many thousands more men employed in the industry. Also the coal mines have been developed to a greater extent and are deeper and more dangerous than in 1870. Much of the credit for this remarkable improvement is due to the use of permissible explosives and electric firing. Figures do not lie, and there is still room for an even better showing than the above, because compared to European statistics we are still behind in the matter of safety and protection in coal mining.

Statistics also show that of all the accidents due to explosives in coal mines 25% are caused by premature blasts caused by miners using short fuses or defective squibs. Why miners and mine operators will still persist in this antiquated method of firing explosives is hard to see.

When explosives are detonated electrically, the maximum execution is always assured. The blast cannot occur until the miner desires it and when everyone is in a safe place. As many holes can be fired at one time as desired so that it is possible to use less explosives per ton than when fired by fuse and blasting caps.

We have seen mines in which permissible explosives were used and still the old practice of fuse and blasting caps in use. How inconsistent that is! Surely if a mine requires the use of permissible ex-

plosives—and there are very few in which conditions could not be improved by their adoption—in order to harmonize, these explosives should only be detonated with electric blasting caps.

The cost of installation is very low. A blasting machine suitable for use in mines costs about \$10 and will last for years if properly cared for. Electric blasting caps cost little if any more than fuse and blasting caps, and the cost of leading wire is small. The advantages and benefits gained greatly outweigh the small first cost of installation.

In order to make the working conditions of the miner, which at best are bad enough, better, safer and more pleasant, not to mention the added protection to the mine property, you should, Mr. Operator, adopt the use of permissible explosives and electric firing.

Copper's Enviably Position.

That present inquiries from foreign and domestic consumers call for all available copper to be produced up to next July is voiced by all the leading producers and sellers. November-December copper is fast going out of the market, and most of the current business is for first quarter 1917 delivery. Contracts are also being placed for second quarter copper for account of individual British, French and Italian consumers. This business is in no way connected with negotiations for the sale of a huge amount of next year's copper to the allies.

The volume of copper sales during last week was close to 75,000,000 lbs. according to estimates of producers figuring largely in the business done. Bookings were made through next July although the bulk was for the first quarter of next year.

Domestic demand was from brass and wire mills. The brass plants laid in their requirements against record-breaking tonnages of finished goods sold to the banking agents of foreign governments. Wire mills bought copper against a renewal of demand for their products from domestic users.

There were some good sized individual orders for copper placed by domestic manufacturers. The largest of these was for 20,000,000 lbs. taken by a brass mill to be delivered during the first half of next year. It is understood that prices on this business range up to 26 $\frac{3}{8}$ cts. a pound.

Negotiations for what will prove the largest individual block of copper ever figuring in one transaction are expected to be closed up during the coming week.

December sales have been made at 27 $\frac{1}{2}$ cts. but the price has now moved up to 27 $\frac{3}{4}$. First quarter copper commands 27 cts.

Will there be an Iron-Ore Shortage?

Will the steel mills of the country, depending on Lake ore shipments, have sufficient stocks on hand to see them through until shipping opens up

next spring, is a question that is receiving consideration these days. The coming winter has everything to do with the situation for on its duration depends the tonnage to be shipped. If the season is of normal length, about 5 months, a supply of 28,000,000 tons would enable the furnaces to operate at capacity until shipments resume. Any prolongation of cold weather, however, would force a curtailed production.

It is estimated these mills are now consuming approximately 5,500,000 tons of ore monthly, estimated consumption for the year being about 65,000,000 tons. It is calculated total ore shipments will hardly exceed 63,000,000 tons, and are likely to be under 61,000,000 tons, so that there would appear to be a shortage of from 2,000,000 to 5,000,000 tons. If shipping can be continued beyond the 15th of September, however, this difference may be made up.

Little assistance can be expected from sending ore by rail, as it is pointed out that the cost of rail transportation would add several dollars a ton to the cost of iron and steel and that even if ore were thus sent it would freeze in transit and be very difficult to unload and handle. Further, it is questioned whether the roads tapping the Lake ore regions have sufficient capacity to make up any important shortage.

Spelter prices have strengthened as a result of the large purchases that have been made by domestic manufacturers who sought to cover their requirements against big brass orders placed in this country for foreign account since the first of September. This demand has not been confined entirely to the wants of American consumers as foreign inquiries have been for large quantities. Canada's needs are extensive and France has been taking no small lot. Other European countries are also taking sufficient to supply their needs.

Report comes from Mexico that special mine taxes decreed throughout Mexico by governors and military commanders have been revoked by Gen. Carranza. This is considered especially favorable to mining interests, which are largely American. Decree has created favorable sentiment towards de facto government and it is reported that mining men are already talking about reopening plants in northern part of republic.

A perusal of the recently passed revenue bill reveals the fact that the protests of the Western senators were heeded to the extent that the copper tax was dropped entirely. As the proposed tax, with copper at 25 cts. a pound, would have placed an added burden of \$10,000,000 annually on producers, there is cause for much rejoicing on the part of the operators.

The discovery of a new diamond field is reported in the Transvaal, about 6 miles distant from the famous Premier diamond mine and 18 miles from Pretoria. It is stated that the initial finds were exceptionally good, and there has been a rush of diggers to the new ground.

PERSONAL.

C. D. Rookledge is now superintending operations at the Cyclopic mine, Gold Basin, Ariz.

A. W. Liliendahl, consulting mining engineer, Saltillo, Mexico, has been in Cripple Creek, Colo.

Francis Church Lincoln, Mackay School of Mines, Reno, Nev., has returned from a trip to Bolivia.

Horace V. Winchell, consulting mining geologist, Minneapolis, Minn., has been in Lovelock, Nev.

P. Burns, Calgary, Alberta, owner of the First Thought mine, Orient, Wash., is now in Spokane, Wash.

E. Horst, mining engineer, Webb City, Mo., has returned from a trip to Chicago and northern Michigan.

Charles F. Williams, mining engineer with the Cananea Con. Copper Co., Chivatero, Mexico, is in Reno, Nev.

Oscar H. Hershey, geologist with the Bunker Hill & Sullivan Co., Kellogg, Idaho, has been at Spokane, Wash.

Dorchester Mapes, Chicago, is now in Laramie, Wyo., and will act as manager of the Rambler mine near that city.

James Callahan, Wallace, Idaho, has returned from a trip to Phoenix, Ariz., and New York and is now in Slocan, B. C.

E. C. Taylor, real estate agent for the Miami Copper Co. at Miami, Ariz., is revisiting his old home at Houghton, Mich.

H. H. Nicholson, consulting engineer for the Plinco Copper Co., Plumas county, California, is now in Salt Lake City, Utah.

Harold K. Boysen, mining engineer with the Tough-Oakes Mines Co., Swastika, Ont., has recently been in Chicago.

R. B. King has been appointed manager for the Highland Valley Mining & Development Co. at Ashcroft, British Columbia.

Van Evera, consulting mining engineer, has recently returned from a trip to Chicago, from his headquarters at Virginia, Minn.

George B. Holderer, recent manager of the Furlough Development Co., Arizona, is now with the General Chemical Co., New York.

Nelson Dickerman, mining engineer, San Francisco, has left to do professional work in Bolivia and Chile. He will return about Dec. 1.

H. S. Emlaw, mining engineer of late with H. S. Crawford & Co., New York, is in Spokane, Wash., from his present location at Grand Haven, Mich.

Wm. Wearne of Laurium, Mich., has resigned the head captaincy of the South Lake, North Lake, Indiana, and Algoma mines, in the Lake Copper Country.

Clyde A. Heller, president of the Belmont Development Co., and the Jim Butler Mining Co., Tonopah, Nev., has returned from a trip to Prince Rupert, B. C.

H. M. Whitman, of Boston, head of the statistical department of Hornblower & Weeks, is making a 3 weeks' stay at Houghton, Mich., visiting the mines in the Copper Country.

J. B. Umpleby, geologist with the U. S. Geological Survey, has been investigating fields in Idaho and will shortly leave for Washington, D. C. At present he is in Chelan, Wash.

W. A. Carlyle, formerly general manager of the Rio Tinto mines, Spain, and at present consulting engineer for the International Nickel Co., New York, as well as representative of the British government in the construction of the \$2,000,000 smelter to be built at Sudbury, Ont., is now in Butte, Mont.

Frank M. Estes, Spokane, Wash., representative of the American Smelting and Refining Co., has left for New York and from there will go to Chile in the interests of the company.

Edwin S. Berry, who has just joined Pope Yeatman as a partner, with offices at 111 Broadway, New York, sailed for Peru September 16 in connection with mine examination work in that country.

J. B. Cunningham, now second instructor in the metallurgical department of the Michigan College of Mines, has been appointed to the first instructorship, made vacant by the resignation of Assistant Professor Chapman.

R. R. Wiggins, mining engineer, has recently returned from Prinzapolca, Nicaragua, and in company with G. F. Schreiber, of late with the Alaska-Gastineau Co., Thane, Alaska, will examine properties near Lead, S. D., Boise, Idaho, and Grant's Pass, Ore.

OBITUARY.

William H. James died recently in Iron Mountain, Mich. He was born in Staffordshire, England, in 1833. He first went to Illinois on coming to this country and in 1879 came to Iron Mountain. In 1884 he took up a homestead at Iron River near Iron Mountain and on this land the James mine was later located. After it was developed and operations were commenced by the Mineral Mining Co., the property was known as the Osana mine.

Frank MacMillan Stanton died September 12 at White-stone, Long Island. He had been suffering for the past few months from intestinal trouble, and about a month ago was operated upon. The deceased was a son of the late John Stanton, one of the pioneers in the Lake Superior copper mining region, and was himself a mining engineer. He was treasurer of Wolverine, Mohawk, Michigan and White Pine copper companies at Lake Superior, of which his brother, John R. Stanton, is president. He was also a director in many more corporations. He had just passed his fifty-first birthday.

John V. Beekman, for many years connected with the Lidgerwood Manufacturing Co., passed away at his home in Plainfield, N. J., September 11. Mr. Beekman was born in 1842 at Somerville, N. J. About 1870 he engaged in the manufacture of rotary engines, pumps, etc., being a member of the firm of John A. Lighthall-Beekman & Co., with works on Imlay street, Brooklyn, N. Y. This company was absorbed by the Lidgerwood Manufacturing Co. in 1873, Mr. Beekman assuming charge of the works of that company, and was the inventor of many improvements in hoisting engine design. Mr. Beekman gradually withdrew from active participation in business about 10 years ago, devoting his later years to outdoor pleasures, becoming an enthusiastic motorist and golfer, being a member of several golf clubs, and a familiar figure on the golf course at Pinhurst, N. C., where he spent his winters. For many years he had been a member of the American Society of Mechanical Engineers. His death is keenly felt by his surviving family, and by many of the men with whom he was formerly associated.

NEW PUBLICATIONS.

The Atlantic Gold District and the North Laramie Mountains in Fremont, Converse and Albany Counties, Wyoming. By Arthur C. Spencer. Washington, D. C., U. S. Geological Survey. Bulletin 626; pp. 85; illustrated.

In view of the fact that considerable has already been written in reports regarding the district and its ores this bulletin has been directed to making a more detailed geological map of the district. A general review of the area and its history is first made. Economic geology and the geology of

the formation is then considered. In taking up the North Laramie mountains brief but separate descriptions are given of the mines, prospects and other small areas and this is again classified into three districts.

Ozokerite in Central Utah. By Heath M. Robinson. Washington, D. C., U. S. Geological Survey. Bulletin 611-A; pp. 16; illustrated.

This mineral, commonly known as "mineral wax," has heretofore been largely imported. The purpose of this report has been to aid in opening the domestic fields. Tests for the mineral, its genesis and other geological information regarding it are given, with accounts of the mines in the area covered by this report.

Cement in 1915. By Ernest F. Burchard. Washington, D. C., U. S. Geological Survey. Mineral Resources of U. S. II:16; pp. 21.

Portland, natural and puzzolan cement are considered under separate headings where production, prices and other items of interest are given. Under Portland cement the production and shipments are taken up in general for the country, by states and commercial districts. Information is also given on the manufacture of Portland cement.

Principles of Oil and Gas Production. By Roswell H. Johnson and L. G. Huntley. John Wiley & Sons, Inc., New York. Book; pp. 371; illustrated. For sale by Mining World Co., \$3.75.

In the writing of this book the authors have well fulfilled their attempt of contributing a well balanced and up to date book. Undue subjects, though considered in some cases briefly, are not overdwelled on, and so much theory and practice is taken up as is of direct value to those interested in the oil and gas industry in the field. Necessarily the subject of geology must be given considerable preference over other subjects of interest to the oil producer and in the preface the authors state that they consider the time past when the sole requirement of an oil geologist is to recognize and map folds. The genesis, geology, nature and methods of locating wells are dealt with in separate chapters in the initial pages of the book. Leasing is also considered and followed by chapters on drilling and methods of bringing in a well. Chapters on management and methods of extracting are considered of less importance as also are chapters on methods of valuation and reporting on oil and gas prospects or properties. A fair account is given of the location of oil and gas areas in North America and the few concluding pages of the text are on the oil market and future supply followed by an appendix.

TRADE PUBLICATIONS.

The Pulsometer Steam Pump. Pulsometer Steam Pump Co., New York. Booklet; pp. 48; illustrated.

The first part of the booklet is confined to discussing the operation and construction of the pump, and besides views showing the construction of the pump many showing its practical application are shown. The latter type of views make up the greater part of the views shown. These views show that all that is necessary for installation of the pump is a beam or the like to which a "block and tackle" may be fastened. The pump in most instances is then fastened to the block and tackle. This arrangement gives general satisfaction in sinking operations. The latter part of the booklet reviews the various uses of this type of pump. Tables of costs, repair parts, etc., are also given.

Grinding Machinery. Colorado Iron Works Co., Denver, Colo. Pamphlet No. 31; pp 31; illustrated.

A series of separate articles are here included, each article taking up the correct uses, principles of operation, design and descriptions of operations in the field. Drawings of systems for installation are reproduced and tables of specific data are given in nearly all instances. Ball mills are first considered and followed by talks on grinding pans and tube mills. Tables showing standard sizes for each class of equipment are shown. Drawings are then reproduced with the dimen-

sion lines lettered. A table accompanies each of these drawings with each dimension letter on the drawing arranged so that these dimensions for different sized machines can readily be noted. "Slime Density Relations," abstracted from Metallurgical & Chemical Engineering, is given and includes a 2-page table showing slime density relations.

Hydro Turbine Air Compressors and Vacuum Pumps of Single Stage Types. Nash Engineering Co., South Norwalk, Conn. Bulletin No. 5; pp 4; illustrated.

The bulletin takes up a general description of the machine and points out the advantageous places in which it may be used. The machine consists of a casing with an internal revolving member having blades, the entire machine being something similar to a water turbine. The casing is elliptical in shape. Water is inside the casing and due to centrifugal force follows the casing. It recedes and re-enters the rotor twice during a revolution and thus acting as a piston compresses the air. Among some of the advantages the company claims for this machine is that there is no pulsation because at least six of the blades on the rotor are delivering at the same time. Large clearance and the lack of complicated parts are among other features which it is endeavored to bring out.

INDUSTRIAL AND TRADE NOTES.

M. W. Hull has been appointed manager of the Pueblo Foundry & Machine Co., Pueblo, Colo. He formerly operated a machine shop in Los Angeles.

Sarco Company, Inc., in view of the increase of business, has opened a new office at 963 Drexel building, Philadelphia, Pa., under the management of F. C. Perkins.

The Anaconda Copper Co., Butte, Mont., has recently purchased from the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa., a 1215-hp. synchronous motor which is to be used for compressor service in the Leonard mine.

The Flint mill near Rollinsville, Colo., erected 2 years ago, operating 3 weeks as a cyanide plant, has been purchased by the Morse Bros. Machinery & Supply Co., and is being shipped to Denver for resale. The equipment consisted of crushers, Chilean mills, Pachuca tanks, Dorr thickeners, etc.

The Imperial Brass Mfg. Co., 1200 West Harrison street, Chicago, will shortly begin the construction of a new addition to its plant. Floor space is to be increased from 75,000 sq. ft. to 150,000 sq. ft. Orders have already been placed for the new factory equipment. The company's plant has been running night and day for many months without any war business, and there is every expectation that the new plant will be taxed to its utmost.

The Virginia Smelting Co., West Norfolk, Va., has purchased two blast roasters of the Holt-Dern type, for roasting pyrite cinder resulting from the manufacture of sulphuric acid. The pyritic cinder is chloridized in these roasters and then leached to recover copper. This roaster is manufactured by T. P. Holt and Geo. H. Dern, Salt Lake City, Utah. Mr. Holt went to West Norfolk to supervise the installation and starting of the roasters.

What is believed to be the largest natural draft cooling tower so far built has recently been completed at the Anderson, Ind., plant of the American Steel & Wire Co. This tower is of the Wheeler-Balcke type, built by the Wheeler Condenser & Engineering Co. of Carteret, N. J. The tower is approximately 150 ft. long, 50 ft. wide and 75 ft. high, and has a yellow pine frame with cypress sheathing and filling. The tower has two chimneys which rise above the cooling stacks and create the air circulation by natural draft. The capacity of the tower is 7300 gals. a minute, cooled from 115 to 85°.

Late News From the World's Mining Camps

Editorial and Special Correspondence.

ALASKA.

Juneau.

In reviewing the Alaska Gold Mines Co.'s property resident Hayden just recently returning to New York from a trip of inspection says: "There has been but one disappointment, both to the stockholders and the officials of the property, and that is that the assay value of the ore has not been as high as that shown in development of the property before its purchase and which was actually being obtained at that time. When the property was purchased the mine had been opened by what was the most natural method of development, viz.: the driving of a crosscut tunnel from the Silver Bow basin where water power was available and where there was a natural mill and townsite, to that point in the middle of the mountain where such a tunnel driven perfectly straight would cut and cross the vein. Immediately on passing into the vein the property was opened up along it both to the east and west for a distance of some 2000 ft. and stoping operations were begun. From 1907, in a small mill which could only run during the summer months on account of inability to get power, nearly 400,000 tons of ore were treated, which had an average grade of \$1.80, corresponding to a recovery under our present methods of milling of better than \$1.55 per ton. From the best engineering and geological advice which we can possibly get there is absolutely nothing to indicate that the ore body where struck by this tunnel should be any better or any worse than it should be either above or below this level or in other parts of the ore zone longitudinally. We furthermore know that in crosscutting through the vein to the shaft from the new Sheep Creek tunnel, known as the 13th level, 300 ft. below original openings, we encountered in large bodies as high grade ore as has been found anywhere in the mine. We furthermore know that the Treadwell mine operating across the channel has found lean places on certain of its levels and has at much greater depths than we have now reached again come into good values. We also know that the Alaska-Juneau property immediately adjoining ours on the west end and in the same lode system has cut these ore zones at some 300 ft. lower than our deepest level. The continuation of development work which has been done since the purchase of the property indicates that the ore exists in a number of separated shoots, some of which are materially higher in grade than others. The proper opening of the property for most economical mining requires that the upper levels be prepared first, and the developments in these upper levels of the west portion of the mine have been disappointing as to assay values. This has been due largely to the necessity of opening stopes before time could be taken for elaborate development, and of including in them greater widths of ore zone than would have been done had we understood the character of the ore bodies as well then as we do now. This early preparation of stopes has resulted in an accumulation in them of some 3,000,000 tons of broken ore and it is impossible now to go into the tops of these stopes and narrow them down for the purpose of improving the grade. As new stopes are opened on the levels below, this can and will be done, but it cannot be done until the comparatively low grade ore now broken has been drawn away; and as the average of all of this broken ore is such as to return a profit when run through the mill the only logical and natural thing to do is to so mill it. In the meantime other areas of better grade ore have been and are being developed to the extent that we now are deriving some benefit from those easterly sections, but due to structural conditions of the ore bodies there we have not been able to produce from them as rapidly as we hoped, and without sacrificing large and valuable ore bodies, cannot very greatly increase the

grade of ore now going through the mill until the large amount of low grade ore already broken in the westerly sections has been disposed of. Summing the whole situation up, it is fair to say that the results up to date have been somewhat disappointing, but viewing it in the light of the more perfect information we now have, the financing, development and equipment of the property on its present showing and to the present extent is fully justified from every viewpoint, and the same people who have been responsible for these things would do the same thing if they saw the property as they see it today instead of as they saw it in the beginning."

Cordova.

The McKinley Lake and Lucky Strike properties near Mile 22 on the Copper River & Northwestern railway, have been bonded to Col. B. F. Millard of Valdez. Twenty claims are included in the two groups, which are located on the north and northeast slopes of McKinley mountain and extend to the shores of McKinley lake. A recent examination of the properties, during which 88 samples were taken from the workings, shows that development to date has exposed three large veins, the widest of which has a width of 65 ft. Values in gold averaging from \$3 to \$5 were found to persist through long distances. According to the report very few blanks were found in the samples, and on the other hand several places yielded returns of \$20 to \$40. The assessment work to be done this fall will be planned with a view to increasing the information obtained by the sampling.

Col. Millard is of the opinion that the properties can be worked on a large scale with good profit. Barges can be taken from Cordova harbor up Alonganic river and Lake McKinley, directly to the Lake group. Excellent saw timber is plentiful on the claims. Salmon river and its tributaries provide a nearby source of power which is considered abundant for all mining and milling purposes. The terms of the bond are favorable and show the confidence of the present owners in their ground. A year hence, on Sept. 1, 1917, a small payment will be required, followed by an increased amount a year later.

ARIZONA.

Oatman.

Oatman is still growing, new building being continuous and showing that the people have a deep and abiding faith in the district. Quite a number of mining properties have become inoperative. In the main, these are properties of companies which started operations on a "shoestring" and which were not able to continue operations when the summer slump in the market for speculative stocks rendered it impossible to place their securities fast enough to supply working capital. Some of these undoubtedly started operations with the idea of selling out before much work had been done. Where such properties are well located and give much promise from the standpoint of the mining engineer, refinancing negotiations are already under way, and in a number of cases will be successful. Inoperation of the others is really a benefit, rather than a drawback.

The companies which are now working—and there are more than 30—are seemingly well financed, are in many instances being financed by eastern capital, which up to 2 or 3 months ago had not become interested in the district, and are determined to thoroughly explore their properties at depth and make mines if mines may be made. In other words, they are mining in the manner which is required to develop paying mines—are legitimate in every sense of the word. A number of other concerns which had shut down, both because of the

hot weather and slow movement of treasury securities at low prices, are now finding it possible to market their stocks at fair prices, and as soon as proper cash reserves for long development campaigns have accumulated, will resume operations. Several large deals are pending, whereby eastern capital will control attractive properties.

Another thing which points to the fact that Oatman has passed through its leanest period is that influential brokerage houses in the east and middle west are pointing to the district as one of great promise and advising clients to buy. The market for these securities is thus rapidly broadening, whereas up to the first of July it was practically confined to the southwestern states.

The new 200-ton mill of the United Eastern is now more than 50% completed. The major part of the heavy machinery has been placed. When this mill starts operation during the latter part of the year a new and heavy producer will have been added to the camp. The new working shaft at the mill site is now almost completed to 600, and then will be driven to greater depths and new levels opened. At the same time exploration work is in progress to determine how high the ore shoot—which has been opened for more than 900 ft. in length—extends above the top, or 350-ft. level.

The Gold Dust Co. has a considerable tonnage of ore in sight, and when the old Orien mill, on this property, is remodeled, will commence ore treatment. Experiments are being conducted in a Los Angeles laboratory with a new amalgamation process which embodies fine crushing and rotary agitation of pulp and amalgam. The gold in the Oatman ores is too fine to be saved by stamp and pan amalgamation.

The Tom Reed is steadily operating its 20 stamps at full capacity, and in addition to the usual work in its main line is sinking four new shafts at various points on its large estate.

The Gold Ore Co., with a large tonnage of ore averaging better than \$20 in sight, is planning a 30-ton mill. At the same time, it is learned that negotiations for the purchase of the property are being made by an eastern concern, and it is hinted that the possible purchaser may be the U. S. Smelting & Refining Co., which owns the Gold Road mine, adjoining the Gold Ore.

The Carter is steadily developing ore, and control may soon pass to eastern interests.

Fessenden will resume soon, and at this time a Pittsburgh concern is negotiating for control, with the time limit soon to expire.

Lucky Boy and Lucky Sam promise to resume soon, as do the Lazy Boy and Nellie, the two latter having been held up because of water.

Ivanhoe, at a depth of 500 ft., encountered a flow of 900 gals. of water. This was encountered in the face of a drift on a promising vein. The characteristics of the rock had radically changed at this point, mineralization and oxidization being more intense, the showing being better than anything in the history of the property. As soon as pumping machinery can be installed operations will resume.

Black Range, Sun Dial, Oatman Amalgamated, Boundary Cone, Adams, United Western, San Francisco, Mohawk Central, Jerome Oatman, North Star, United Northern and Pittsburgh are others which are steadily developing.

Arizona Central is making a fine showing in its shaft, and seems to have neared its vein, on account of the stringers carrying high values which have been encountered. Lexington has found milling ore at a depth of 110 ft., and Oatman Gold Mining & Milling at a depth of 500 ft. has drifted some 30 ft. in a vein which is showing about 2 ft. of pay ore, and which gives promise of being the end of an important ore shoot.

On the Big Jim property during the past 7 months discoveries of ore have been reported, and in the meantime work of developing these ore bodies has been in progress. Conditions are such that the engineer may now enter the Big Jim property and form a satisfactory conclusion as to the merits of the property. It is the opinion that Big Jim is developing into one of the important gold mines of the southwest, and that it will eventually become a large producer of gold. The property has as yet been developed on but two levels. One of these is at a depth of 400 ft., the other at a depth of 485. The

shaft is about midway between the main mine of the Tom Reed and its Black Eagle mine, and on the same lode system. On the opposite side of the Tom Reed main workings from the Big Jim is the United Eastern, also on the same lode system. There is a heavy seepage of water on the 485-ft. level of the Big Jim, which constantly washes off the walls and faces of the drifts, and renders an examination very easy. The drifts to the east and west of the point where the crosscut from the shaft entered the vein total more than 350 ft. At intervals the vein has been crosscut, and is about 30 ft. from wall to wall. The main drift is run along the hanging wall of the vein. The shaft is on the foot wall side of the vein. On the 400 level the east and west drifts total about 350 ft. in length, and the vein is of the same width as below. The average values appear to be some higher than on the 485 level. Bulkheads are now being put in on this level so that upraises may be driven to ascertain the height of the ore shoot.

In the main workings of the Tom Reed, immediately adjoining, on the strike of the same lode, the highest values were found between the 250 and 300 levels. Values then decreased until a central zone of about 500 ft. was reached, and then slowly increased until the 750 point was reached, where they were higher than any previously encountered. From this point down to 1100 ft. depth values appeared to hold very constant. What purported to be official assay maps of the Big Jim and of corresponding levels in the Tom Reed show that values and conditions in the two properties, level for level, appear to be identical. Formation and ore, according to all visible conditions, appear to be so similar that it is the belief that the Big Jim will show pay ore to as great a depth as has been shown in the Tom Reed to date. The exposed ore shoot in the Big Jim is now more than 450 ft. in length, and averages better than 25 ft. in width, and it is the opinion that it will mill to an average much in excess of \$20 per ton. The property has a fine machinery and surface equipment.

It is interesting to note that Oatman is a "dry" camp, and is the first prominent new mining camp in the nation's history in which the sale of liquor and gambling is prohibited, and which mining, rather than gambling, is the principal industry.

CALIFORNIA.

Goldstone.

New York capital has become heavily interested in the Goldstone Mining Co. and arrangements are being completed to sink to a depth of 500 ft. Orders have been placed for a hoist, compressor, machine drills and other equipment. The Cooper lease has opened rich ore at a depth of 50 ft., and several other leases are shipping ore of remarkable richness.

The United Goldstone Mining Co. is preparing for work. The company owns 23 claims in the eastern end of the district, where rich ore has been disclosed. A number of other companies are active and numerous shipments are being sent out. Machinery for the first unit of the custom mill is on the ground and the plant is scheduled to go into commission about Oct. 1.

Oroville.

The Oro Electric Co. has arranged to operate its mining properties under the name of the American Gold Dredging Co. Arrangements have been made to install a new dredge at Thermalito, and for completing a boat in the Mokelumne field. Preparations are being made for exploration of promising territory along the Sacramento river, in the vicinity of Redding. Two dredges are operated near Oroville.

Nevada City.

Operations are soon to be resumed at the Phoenix mine, 2 miles north of Nevada City, with Andrew Goering in charge. The mine has produced some good quartz, but recent work indicates the near proximity of a gravel deposit and the main 980-ft. tunnel will be extended to tap the channel. No. 2 level will also be driven further.

Groveland.

Production has been resumed at the Cosmopolite mine and the improved mill is running on ore of fair grade. The property was acquired Aug. 19 and considerable underground

work has been already started. The mine contains large deposits of low-grade material and the new owners plan to install additional reduction machinery and to operate along broad lines. Tonopah capitalists are interested.

Woody.

The Weringer Mines Co. has ordered a Hardinge mill, Dorr classifier, Oliver filter and several flotation machines for its 100-ton plant. A 150-hp. gasoline engine has been installed and preparations made to operate at greater depth. Massachusetts people are interested.

Happy Camp.

The Gray Eagle copper mine has been purchased by W. B. Thompson and associates of New York, and it is reported a reduction plant will probably be erected early in 1917. The mine is the largest developed property north of the Shasta field and contains fully 500,000 tons of ore. The ore is chalcopyrite, averaging 5% copper. The mine lies 7 miles from Happy Camp, and for years has been developed by the Dakin-Farish syndicate. It is considered the most important copper development in California since the Mammoth mine at Kennett started production.

Angels Camp.

The Angels Deep Mining Co., numbering 50 Angels Camp business men among its stockholders, has started work at the Pioneer mine. This property is on the same lode as the Gold Cliff, the premier producer of the district, and adjoins the Lindsay, recently purchased by the Utica Mining Co. Although opened only to a depth of 200 ft., the Pioneer has produced some rich ore and is highly regarded by local mining engineers. John C. Benson is superintendent.

Forbestown.

After a series of experiments extending over 18 months the Forbestown Con. Co. has demonstrated the efficiency of the flotation process. It is stated an extraction up to 98% has been secured. It is probable arrangements will be made at once for installation of a large plant, as the mines contain extensive reserves of good grade ore. The group comprises the Gold Bank, Shakespeare, Gold Queen and other noted gold yielders. M. J. Cooney is manager.

Redding.

The Mammoth Copper Co. has started work on its electrolytic zinc plant, which is to cost in the neighborhood of \$350,000. R. M. Hanley, former superintendent of the Bully Hill plant at Delamar, will have charge of the new smelter, which will embody a process developed by the Bully Hill engineers. The plant will enable the Mammoth Co. to advantageously treat its zinc ore besides turning to profitable account the solids deposited in the baghouse by furnace fumes.

Sonora.

The Pittsburg-Silver Peak Co. has unwatered the Rawhide mine to a point below the 1200 level, and is busily engaged in clearing the deepest workings. As soon as possible sinking of the shaft will be resumed. In the old levels some good ore has been intersected and good tonnage is indicated. The company plans extensive work in new territory in hopes of intersecting extensions of rich veins formerly worked.

The Excelsior mine near Sugar Pine was examined last week and will probably be reopened. The mine produced \$100,000 in pioneer days, although never operated to a greater depth than 225 ft. Some good ore is exposed.

Jamestown.

The North vein has been intersected in the Nyman Con. at a point 30 ft. from the 800 level of the Knox & Boyle shaft. Several feet of good quartz are exposed, of which 2 ft. assays \$50. From the main workings a good tonnage is being mined. The 10-stamp mill is crushing 30 tons of \$35 ore daily. Within a short time the shaft will be carried deeper and extensive lateral work prosecuted in new ground.

ment shaft on the Happy Year claim. It has entered the Happy Year basalt dike and while low values obtain at this point the dike will be crosscut before drifting is commenced. The Happy Year dike is 20 to 25 ft. wide and the management is confident that with development ore shoots along its course will be entered within the boundary lines of the War Eagle. The Happy Year shaft has attained a depth of 175 ft. and the work of sinking is planned to continue to the 500 level. On the War Eagle the company is prospecting the Amanda-Bogart dike by drift carried northwest from the 3rd level of the Darnell shaft. Pay values are reported and the prospects for a permanent shoot are encouraging.

At the Cresson Con. reserves have been increased 500,000 tons as noted in the report of Engineer L. S. Noble. The ore on hand on July 1, 1916, amounted to 189,282 tons, with an average gross value of \$31.84. Since that date development has added 17,170 tons to these reserves, with an average gross value of \$82.66. The reserves in the mine on Aug. 1, 1916, totaled 291,388 tons, with an average gross value of \$31.10. The net profit per ton on these reserves will be \$20.51, equivalent to \$1,130,318. Shipments from the Cresson mine during August, up to and including the 24th, were at the rate of 6300 tons a month. The proportion of ore from 1203 stope was 34.3%. The average grade of ore broken in the 1203 stope was \$33.33. Since the report of June 24, 12 new ore bodies have been opened by development. During July 809 tons of ore of an average value of \$24.85 were produced from development drifts. The principal addition to the ore reserves were from localities where at the time of Noble's previous report the development was not sufficient to permit of complete calculations and where subsequent work has increased former estimates and added important extensions to known bodies.

Telluride.

Good silver-lead-copper ore has been encountered on the Moody property by leasers. They sunk a shaft in a tunnel which had been run in 550. After getting down 6 ft. from the bottom of the tunnel near the breast they opened a big vein of shipping ore worth from \$35 to \$50. At the point opened the vein is said to be a fissure 12 ft. wide, with a big ray streak. The property is $4\frac{1}{2}$ miles from Vanadium on the wagon road, so that shipping will be an easy matter and not expensive.

The Metals Ore Co. announces its present prices for tungsten ores as follows: 1% ore, \$2 a ton; 1.25%, \$4.50; 1.50%, \$6; 1.75%, \$7.50; 2%, \$10.50; 3%, \$25; 4%, \$35; 5%, \$45; 6%, \$55; 7%, \$65; 8%, \$75; 9%, \$85; 10%, \$95; 15%, \$150; 20%, \$200; 25%, \$250; 30%, \$300.

Ouray.

A flotation unit will be installed in the near future at the mill of the Wanakah Mining Co., which is under the management of J. T. Roberts, Jr. The smelter, which was formerly operated by this company, was sold to the Ouray Smelting & Refining Co., which is a reorganization of the Brown Mountain Smelting Co. No active steps for its operation, however, appear to have thus far been taken.

Leadville.

At the Allegheny property under lease to W. E. Bowden preparations for the resuming of operations are under way. Recently a new steam surface plant was installed and it is planned to replace it with a modern electric plant as soon as possible, following the completion of work now under way. A contract has been given for retimbering the shaft its entire depth of 400 ft. When this is finished, the shaft will be put down an additional 50 ft.

Leasing companies on the Ibex are producing 200 tons a day. It is being mined through the Garbutt and Ibex No. 3 shafts under the management of John Cortellini. The deposit is a porphyry cap carrying gold values averaging \$20 and is the largest body now open in the district. During the past 12 months it is reported that close to \$1,000,000 was extracted and the latest estimate of the remaining ore in sight gave 2,000,000 tons. Preparations for the erection of a concentrator have been under way for some time, and it is now stated that the plant will be built early this winter. The work of opening up and blocking out the ore body has been in progress for several months and plans for producing a

COLORADO.

Cripple Creek.

Crosscutting has been commenced by the War Eagle Con. on the 125 level. It is being done from the new 3-compartment

greater tonnage are nearing completion. A small fissure vein of rich gold and copper ore is also being mined through the Garbutt. The values received from this vein are high and the ore is being extracted at several levels. Bunches of tungsten continue to occur in the big stope, but owing to the low market now prevailing no effort is being made to save it.

Georgetown.

In the 180 level of the Onondaga a 10-in. vein of fine-grained galena has been encountered, which should be worth \$125 as broken. Four Leyner machine drills are on development. A new hoisting cable has been installed in No. 1 raise. This raise is going up 95 ft. to the 500-ft. point, when a contract for drifting 500 to 600 ft. will be let to reach a point directly over the No. 9 raise of the Capital Co.'s ground, but which is now controlled by the Onondaga Company. Guides and a cage will be installed in No. 1 raise if practical. If not, a cross head will be put in so as to make the hoisting of men in the bucket safe. Crosscutting in the Kane adit has now reached a point under the drill hole sunk from surface. Raising to tap the drill hole and remove the bit left therein and to secure ventilation has been commenced.

IDAHO.

Wallace.

The Interstate-Callahan Mining Co. declared on the 15th the regular quarterly dividend of \$1.50, or \$697,485, on the issued capitalization of 464,990 shares. This will make the payments for the current year \$2,092,455, and will increase the grand total to \$4,649,900, or \$10 a share, the par value of the stock, that has been paid since dividend disbursements were inaugurated on April 1, 1915. Now that there is assurance of the O. W. R. & N. building a branch line up Beaver creek, it is generally believed that the company will soon begin construction of its proposed 1200-ton concentrator at Enaville, where a site was purchased several months ago. Plans for the plant already are prepared, and it is anticipated that it will be completed and operating within the next year.

Because production at the Idora and Tuscumbia mines, in the Beaver creek district, has increased to a point beyond the facilities of the Idora mill operating 12 hours daily, arrangements are being made to work the plant two 10-hour shifts, according to Charles E. Mallette, secretary-manager of the Idora Mining Co., which owns the concentrator. "We probably should have begun working the mill longer hours some time ago, as both Ehrenberg & Nelson, who have a lease on the Tuscumbia mine, and the Idora Co. are producing more ore than we can store without going to considerable expense," said Mallette. "On the 11th we turned over the plant to the Tuscumbia leasers for 2 weeks to give them an opportunity to treat some of the ore they have ready for milling, and in the interval we will begin some new development at the Idora. The work planned will open on the No. 3 level the ore shoot in the western part of our ground that to date has been reached only by the No. 2 level and connected workings. Conditions indicate that this is the same shoot that is being developed by the Sunshine Co. in the Toughnut claim, within 100 ft. of our end line and about 70 below our No. 3 level. Supt. E. L. Latta of the Idora reports that the showing in the Toughnut is rapidly improving as they approach our lines, and he is confident that we can pick up this shoot under our No. 2 workings by extending the No. 3 level about 100 ft. He says also that there never before has been so much ore in sight in the Idora, and that he could put a force of 20 men to work mining if the mill was able to handle the output."

Information secured from reliable sources closely in touch with the management of the Nabob Mining Co., which owns the Nabob group on Pine creek, and recently secured a lease and bond on the Denver claim, adjoining, states that eastern investors are seeking to secure control of the stock of the Nabob, and that if the deal is consummated development of the property will be inaugurated on an extensive scale. The company now is capitalized for 1,500,000 shares at \$1 each, of which 250,000 still are in the treasury, but a meeting of the stockholders will be held Oct. 2 to increase the capital stock to 2,000,000 shares. If this is done the eastern syndicate will

take over the added capitalization and the treasury stock at a price said to be considerably in excess of the prevailing market price. Its representatives already have secured enough of the issued stock in the last few weeks to assure control if the capitalization is increased.

The option to purchase the Douglas mine, in the Pine creek region held by the Anaconda Copper Co., has been extended for 6 months. Development of the property is proving conditions that are satisfactory, and if urgent demand had been made the option would have been exercised on the original date of expiration, but certain elements in the situation made it advisable to request an extension, which was readily granted. There is no doubt but that the option will be exercised eventually, as the property is standing up to the estimates of the engineers.

Mullan.

Important strikes are reported in both the Morning mine of the Federal Co., and in the 1200-ft. level of the Hunter mine. The strike in the Morning was unexpected, the exposure evidently being a new vein, lying north of the Morning vein, encountered in an extension of the No. 6 tunnel. The shoot, about 20 ft. wide, is principally sulphide, and it is said that as high as 60% zinc has been shown by assays, but what the entire deposit will average has not been made public. Development is being rushed to prove the extent of the shoot.

The Hunter Co., after months of searching, has located the ore on the 1200-ft. level. The vein faulted on this level, and it was thought that the company would have to go deeper, but a continuation of the work through the fault finally located the ore, and in larger quantity and better grade than in the old portions of the mine. The company now has a model mine and mill plant.

LAKE SUPERIOR.

COPPER.

Houghton.

Michigan is now drifting on the Ogimah lode in the amygdaloid which, with a width of 7 ft., lies along the hanging-wall side in a high-grade shot copper stamp rock, after passing through a stretch that was not so good, but commercial. The rock is of a fine chocolate color and is softer than most of the amygdaloids. The drift was first carried along the longitudinal fissure which lies 5 ft. above the lode proper in fairly good ground giving indications of betterment. The western drift has two longitudinal fissures about 5 ft. apart and about 5 ft. wide, which are displaying the mass copper and stamp after passing through a narrow fault. The eastern drift is being carried up towards the 5th or next level, where a little work is also being done in drifting; all of this work is producing the usual good mass and stamp grades.

Isle Royale is now mining on the Portage lode, which is about 150 ft. west of the Isle Royale from the crosscut on the 31st level of No. 2 shaft, finding the ground to be of the average of the Isle Royale lode, mass of different sizes predominating.

Calumet & Hecla has begun to sink to the 17th level at No. 17 shaft on the Osceola amygdaloid in order to test the ground. This is the only sinking that is being done at either lode.

Wyandot is showing nearly 28 lbs. No work is being done on the 8th level, as two stopes have been opened on the 9th; one with a very good width across the lode and a good length along it—all of very good copper—and the other considerable less so far in extent but of equally high value. Drifting will be started on the 10th at once. The metal has been better in occurrence on each successive level.

Victoria new Nordberg double-skip hoisting engine, good for 5000 ft., is now running smoothly. From now on the tonnage will be gradually rising.

South Lake the week ending the 9th sent 900 tons of rock to the Franklin mill. The mine at the rate of about 130 to 140 tons daily pays expenses and at the rate of 200 tons, which it is expected to reach soon, will yield a very good profit. The Butler has a very fine stope now cut out to a width of

30 ft. across the lode and the limit has not yet been reached. No. 3 of the South lodes in its progress to the Lake boundary is meeting with quite uniform metal.

New Baltic's directors called an assessment the 15th of \$1, payable Oct. 14.

Hancock is getting a yield of 15 to 16 lbs. of copper. There were milled in August 20,183 tons, from which 306,000 lbs. were recovered. The yield from the Quincy shaft is about 18 lbs., and that from No. 2 has risen considerably lately. The management will soon have all the men that are necessary.

Franklin forwarded to the mill 23,000 tons last month, which is only a little below the rate of 1000 tons daily. Conditions are favorable for somewhat of an increase this month, the only drawback having been the want of men who are now appearing almost daily.

Negaunee.

A Sullivan hoist, which for the past 7 or 8 years has been doing service at the Queen mine of the Oliver Iron Mining Co., is being re-erected at the Sec. 16 mine. It is a duplicate of one now in operation at the Prince of Wales mine, which has been illustrated in the Mining & Engineering World. These hoists are single-drum Corliss plants, with link-motion reverse and steam-actuated brakes. They are of heavy-duty, frame type, and the engines have cylinders 26 ins. in diameter by 60-ins. stroke, twin-engines driving each hoist. The drums are 10 ft. long by 10 ft. in diameter, and are keyed to the shaft. Each drum accommodates two ropes for double-compartment hoisting. The hoisting speed of these plants is about 2500 ft. per minute and the load hoisted in each case is 8 tons of ore. Each hoist is equipped with a Sullivan automatic throttle closing mechanism and automatic brake to prevent overwinding, making it unnecessary for the engineer to close the throttles or apply the brakes in handling the hoists.

IRON.

Marquette.

Up to Sept. 1, the Marquette range shipped 2,169,708 tons, with 3 months of shipping remaining this season. This is a good increase over the movement for the same period of 1915. Most of the Ishpeming mines have cleaned up the ore that was in stock when navigation opened and there will be very little remaining. The Lake mine pile is about gone, and the Cliffs Shaft will have all its piles cleaned up soon. A shovel has been working day and night at the Cliffs the greater part of the past few weeks. Section 16 was late in getting started this year because the new crushing plant was not in condition, but the shovels are loading ore at a good rate now. Some ore has also been shipped from the pile at the old Hematite mine. North Lake has been a steady shipper all season, while some ore has been shipped from the Chase, at Dexter, which was abandoned in 1915. The Cascade district has four shippers this year: the Volunteer, Isabella, Richmond and Empire. The Richmond will send out in the neighborhood of 250,000 tons. This is the Isabella's second year shipping, but the tonnage will be quite satisfactory. The Empire was late in opening and will not be able to get out a great deal of ore. The Volunteer is working a large force of men and moving most of its ore. The Gwinn district is doing better than for several years. There was a heap of ore in stock there when shipping commenced and it will not be possible to move it all. The Republic and Ohio, the only two properties in the western part of the county that are being worked this season, are doing well. The operators of the Ohio recently gave orders to mine ore all winter. There are 100 men employed at the property at present. The Negaunee mine, the largest producer in the district, has sent a good tonnage, but the Maas has not been so fortunate. Some ore has been loaded from the Maas, but there will be considerable left in stock. The Rolling Mill, Cambria and Breitung properties, Negaunee, have been steady shippers all year, as has been the Queen.

Quinsec.

The McKenna property is to be explored by the St. Clair Co., and one diamond drill is already in operation. The lands are considered to be well located and favorable for mineral deposition.

MISSOURI-KANSAS.

Joplin, Mo.

Following the threatened railroad strike, with its depressing influence on the zinc ore market, came the proposed strike of the coal mines in the Pittsburg field. For several weeks the coal mine operators have been attempting to arrange a new wage scale but with indifferent results. The miners have been off from work for over 2 weeks, and practically all of the surplus coal available has already been shipped out and consumed. Those zinc mine operators who have a small supply have already begun using. The demand for fuel has already reached considerable proportions here. Coal companies are not promising delivery of coal, and are taking orders only subject to delivery at the option of the coal operator. There is no relief coming from gas companies, as they cannot even supply sufficient fuel for gas engine plants and the domestic consumption, hence there will be no possibility of utilizing gas in place of coal, nor is it going to be possible to substitute electric power for steam power, as not only does the Empire District Power Co. have its entire available output contracted, but it will be impossible in 6 months to a year's time to obtain deliveries on motors of the size necessary for milling plants. There has been some hope of a settlement of the wage dispute this coming week, but the reports coming have not all been optimistic on this score. Whatever action is taken this coming week will therefore be watched with intense interest by this district, as it will vitally affect, not only the possibility of production, but the future cost of coal, because of the rapid consumption of the surplus stocks.

It was anticipated that this week's ore production would naturally obtain better prices, partially upon account of the above conditions, but while there was some appreciable demand for medium and lower grades, there was not any vital increase in the prices paid, the base range running from \$40 to \$65 per ton, with very little ore being sold at either of the extremes. The bulk of all the ore sold brought from \$50 to \$60.

The Old Cherokee mine at Tuckahoe is under lease by a company made up of Alec Smith, John Schulte, L. P. Mahoney and associates. They pumped out the water which has been one of the principal reasons why the property has proven difficult of operation. The property at one time was well developed at the upper level and a very large production was made, but an attempt was made to work the lower levels, however, it was found impossible to hold water at 155. Since the water was pumped out the old ground has been re-timbered and sufficient ore is now in sight to warrant production by hand jig plant. The crush rock will be handled over a custom plant in that vicinity. It is this same group of men that opened up and developed the Captain "E" mine in the Thoms Station field.

McDonald & Belchic have a lease on 40 acres of the St. Paul Mining Co.'s land near Saginaw, on which three holes have been drilled showing 13 ft. of good silicate ore at a depth of 75 ft. Assays of the cuttings show that they will run better than 40%. In one hole at a depth of 20 to 50 ft. some dry bone has been discovered. More drilling will be done. Three shafts are already down and there has been considerable mining at shallow levels covering quite a period of time.

Galena, Kans.

The Empire Zinc Co. are sinking a large 3-compartment shaft north of Galena. The company is sinking the shaft to open up an ore deposit at the 280 level, which at this lower level is found in limestone. A considerable area has been drilled in the northern portion of Galena showing this formation, and at the Eureka mine, and also at the old Herald mine north and northeast of this point there has been some mining in this formation, also south of Galena at the old Hartford. At none of these three places were mining operations extensive, or at least not sufficient to demonstrate the feasibility of generally working this formation. This formation usually has a thickness of 10 to 70 ft. showing the zinc ore disseminated throughout that thickness of the limestone.

Sufficient work was done on the milling, however, showing that it is difficult to handle on the regular type of mill in this field.

The new concentrating plant of the Andrew Mining Co. on the Martin land north of Galena, is expected to start operation this week. The ground has been thoroughly tested with 18 drill holes, 15 of which are reported to have shown ore at 55 to 120 ft. Three shafts have been sunk and preparations are being made to obtain ore from all three of them. The mill is designed to handle 200 tons of ore per shift. Robt. Andrews of Joplin is general manager of the property.

The Murphy flume on Short creek, destroyed by the big flood of June 19, is being reconstructed, and is expected to be ready for operation this week. In addition to James Murphy the Missouri, Kansas & Texas railway is assisting in rebuilding the flume.

The Andayer Mining Co. has just completed its fifth drill hole on a 40-acre lease $3\frac{1}{2}$ miles southwest of Galena. This prospect showed a 9-ft. face of good lead and jack at the 90-ft. level. A new shaft is being sunk which has already reached the ore, although it is not sunk entirely through it. The company has purchased the old New Market mill and has moved it to the present location. This company will be ready for production within another fortnight.

Miami, Okla.

S. Y. and A. H. Ramage have purchased a half interest in a tract of 200 acres southeast of Picher, Okla., and acquired a lease on additional tracts in the same vicinity. The Ramages contemplate drilling 10,000 ft. of prospect holes in order to test the holdings.

Aurora, Mo.

The Scottish Mining Co. is erecting a new 150-ton mill. This company has thoroughly drilled out the 40-acre tract known as the old Sherwood, and has proved up what is believed to be a very good body of ore.

MONTANA.

Helena.

Ore carrying native copper, as well as good values in silver and lead, has been broken into at a depth of 60 ft. in the shaft of the Looby group in Grass Valley, under lease and bond to the Cruse Con. Mining Co. The strike is considered the most important ever made in the history of Helena mining district. In addition to the native copper, bunches of cobalite ore were also found. A general sample of the ore taken a few days ago, before the copper strike was made, assayed \$59.35 in lead and silver.

The estimated value of bullion produced in August from 1713 tons of ore from the North Moccasin of the Barnes-King was \$15,000. There was no improvement in the bottom workings, where the vein has been narrow and of low grade for several weeks, but the showing in the upper workings is somewhat better than a month ago. The amount of ore worked in the mill of the Piegan-Gloster was 1798 tons, including about 1300 tons from the Shannon, and the bullion yield was about \$18,000. This, however, included the product of 700 tons of Gloster ore worked, but not cleaned up, in June. The winze from the 500 level of the Gloster was unwatered, and it was found that 498 ft. of drifting had been done from the bottom, which is 300 ft. below the 500 level. These workings will be thoroughly sampled, but appearances do not justify the belief that much pay ore can be expected there. The 400 west drift was driven 141 ft. during the month, and for the last 30 ft. the ore assayed \$8 for a width of $4\frac{1}{2}$ ft. The rope tramway at the Shanonn is working smoothly, and a good production from the mine may now be expected. The road from the Woodrow Wilson mine to the county road, a distance of 3 miles, was finished, and hauling of ore commenced Sept. 1.

Butte.

Thomas F. Cole of Duluth, president of the North Butte Mining Co. and at the head of the Rainbow Development Co., which is developing the property of the Butte & London Co. in addition to the Rainbow group, is in Butte on an inspec-

tion of his interests. Mr. Cole expressed himself to friends as well satisfied with the progress of development work and the showing of the ore bodies at the North Butte, following his conference with Supt. Norman Braley.

Work will start at the Butte-Duluth property this week, determination of the exact date awaiting the arrival of H. A. Frank. For 2 weeks men have been employed at the mine, their services having been retained in order to comply with the provisions of the lease. As soon as possible the plant will be put in shape preparatory to handling a large quantity of ore. The plant and mine will be placed in operation before changes in the capacity of the plant will be made. In compliance with the lease the plant will be increased to daily capacity of 500 tons. The Butte-Duluth has been idle for more than a year since it was thrown into the hands of Receiver Charles M. Everett on petition in district court of the Provident Securities Co., who held bonds on which interest payments had defaulted. The negotiation of the lease opens up a way for revival of mining in that district and much satisfaction is expressed in mining circles that one of the principal properties of the East Butte district is again to be worked.

An excellent showing, which it is believed gives indication of development into a silver property of merit, has been disclosed on the Black lease, in the southern part of the city, just east of the Emma property. Lessees, sinking on the claim which lies just east of Main street below Silver, encountered the lead scarcely more than 25 ft. below the surface and the vein uncovered has been pronounced a very promising prospect, a number of tons of ore already having been extracted. The belief prevails among Butte mining men that a good silver property will be developed.

Superior.

At a meeting of the directors of the Intermountain Mining Co., held in Spokane last week, a dividend of $\frac{1}{2}$ ct. a share, or \$8000, was declared, payable Oct. 20 to stockholders of record Oct. 10. This is the first dividend paid by the corporation, and no announcement has been made relative to future disbursements. The Intermountain Co. is composed of Spokane and Coeur d'Alene men, and it was organized over a year ago to take over and operate the old Amador mine. The property had been idle for several years, and the undergrounds were flooded. The workings have been unwatered, a 100-ton daily capacity mill has been constructed, and the railway to Iron Mountain has been repaired and placed in operation. The output of the mine is being shipped to the British Columbia Copper Co.'s smelter at Greenwood, under a very favorable contract.

Iron Mountain.

The Intermountain Mining Co., after paying its initial dividend of $\frac{1}{2}$ ct. a share, declared Sept. 9, payable Oct. 20 to stockholders of record Oct. 10, will have a surplus of approximately \$15,000, including the earnings for September, according to the official report of the management. Steady production has been inaugurated at the property, and regular shipments now are being forwarded to the British Columbia Copper Co.'s smelter at Greenwood, B. C. The financial report that has just been submitted to stockholders is a remarkable showing, considering the conditions that the management has had to face since the company took over the mine and the success achieved places the property in the first rank of those old northwestern holdings that have demonstrated their ability to "come back."

NEVADA.

Ely.

A contract was signed last week for remodeling the Giroux Con. concentrator, near Kimberly. It will be equipped with Callow flotation machines and is expected to be ready for operation within 90 days. The plant will have a daily capacity of 500 tons and tests indicate a high copper recovery. Water for the plant will be pumped from the old Giroux shaft where a good supply is available. Work has been resumed at the Morris shaft which will be unwatered and sunk 250 ft. deeper and levels extended to open the ore bodies.

Ore will be mined by the caving system. G. N. P. Dougall is superintendent.

Additional equipment is being added to the plant of the Nevada Con. with a view to increasing the capacity from its present 12,000 tons daily to 16,000 tons. The product going to the smelter averages about 2%. From the surface workings of the Ruth mine some 5% ore is being shipped.

Goldfield.

Pending installation of additional thickeners and filters the use of flotation has been temporarily discontinued at the Goldfield Con. mill. Minor changes in the plant will also be made to meet changing ore conditions. It is expected the plant will resume within 60 to 90 days. Meanwhile the company will revert to the cyanide process. It is stated the success of the process, however, has been established.

The west crosscut from the 1750 level of the Atlanta has entered the main Consolidated vein and prospecting is proceeding to seek the shoot formerly worked on the 1500 level of the adjoining Grizzly Bear property. Work is advancing in quartz yielding encouraging assays in gold, silver and copper.

Goldfield Merger has started a southerly crosscut from the 900 raise above the 1260 level to seek the extension of a rich ore body worked in the adjoining Grizzly Bear. The latite formation at this point will also be thoroughly prospected and endeavors made to open seams of rich ore exposed in connecting the Grizzly Bear and Merger workings. This work is being carried on by way of the Grizzly Bear shaft. The extensive work in the vicinity of Jumbo Extension has proven fruitless.

Eureka.

This old camp is evincing much activity and the Eureka Mining Bureau has been formed to aid prospective investors. California gulch is the main center of activity, and several mines at this point are shipping. The ore is largely silver, with some lead and gold. Lessees are shipping ore from the California that ranges from \$10 to \$50, the deposits occurring near the rhyolite, an unusual thing in this district.

On the Connolly, controlled by New York capitalists, a shaft is being sunk, a headframe erected, and surface buildings constructed. Good ore is being sent out by lessees. Company work is in charge of Major H. G. Catlin. The Mortimer, Marne, Huebner and several other claims are undergoing development and good ore is showing at numerous points.

Tonopah.

Unwatering of the Great Western mine has been accomplished after 3 months of steady work and as soon as the new pumps are in position the shaft will be sent 300 ft. deeper. From the 1500 level crosscutting will start shortly to thoroughly prospect the rich stringers encountered before water drove the miners out.

The Belmont Co. has acquired the 12 claims comprising the property of the Tonopah Panama Pacific Co., lying east of the East End group. This territory is a short distance from the Halifax mine, where good ore is being developed at a depth of 1300 ft.

Searchlight.

A monthly gold output of \$100,000 is maintained by companies operating in El Dorado canyon, and the outlook is favorable for a marked increase within the next 12 months. Six companies are producing, and several others are prosecuting developments. Plans are being perfected to list several companies on the San Francisco stock exchange.

Rand.

The late strike of the Queen Regent Merger Mines Co. on the 2nd level, 460 ft. from the shaft, of a cross vein 8 ft. thick, has aroused a great deal of interest in the camp. The ore differs from any heretofore discovered in the district, as it carries in addition to the gold and silver values, 7 to 8% copper, and about 8% lead. About one-third of the vein runs from \$60 to \$70, the balance being an excellent grade mill ore. Wm. P. Miller, the consulting engineer of the company, states that the character of the ore is the best evidence so far disclosed in the camp as indicating permanency and depth of ore bodies. This is the fourth vein opened in the mine, and is the only one showing excellent values in copper

and lead. To determine if the veins go to depth the shaft is being sunk to the fourth level, where drifts will be run. At the annual meeting of stockholders recently held the former board of directors was unanimously re-elected with J. E. Kerr of San Francisco, as general manager.

The Last Hope mine adjoining the Queen Regent on the west, has been incorporated under the name of Nevada Rand Mines Co., for \$100,000 with 1,000,000 shares of a par value of 10 cts., with 400,000 shares in the treasury, the balance having been paid for the purchase of the property. Charles Huber, president; Charles Koegel, vice-president and superintendent, and C. R. Murdoch, secretary. These with J. J. Turney of Philadelphia and W. B. Rudderow of Palmyra, N. J., are directors. The company owns 70 acres without indebtedness. Prior to incorporation more than \$30,000 worth of high-grade ore was shipped from the mine, and it is estimated that upwards of \$200,000 has already been developed. The mine is well equipped with machinery and it is reported that the shaft will be carried to the 600 level, with lateral development work at each level, the shaft having already been sunk 250 ft.

The Lappatt mine has lately shipped 6 carloads of excellent ore and the owner states the mine is developing in a satisfactory way that will permit regular shipments to continue.

Winnemucca.

The Craven Copper Co. has started work at its property, 35 miles northwest of Winnemucca, and plans to start shipments within a few weeks. A good tonnage of 7% ore is exposed. F. H. Craven, of McGill, is president and general manager.

NEW MEXICO.

Elizabethtown.

Payora Mining & Milling Co., controlled by J. G. Schnell, Pueblo, Colo., president, and A. T. McIntyre, manager, and their associates, has opened a 4-ft. vein of ore in quartzite. The ore consists of copper sulphide, assays of which show 17% copper, 10 ozs. silver, and from 0.3 oz. to 1.2 ozs. gold, these metals being in a quartz gangue. The company has a 20-ton Huntington mill and Wilfley tables, on which a test

PORTAL OF CROSSCUT ON PAYORA PROPERTY.

run of average ore was made. The result showed a recovery of metals worth \$47.70 per ton. The vein was opened by a 190-ft. crosscut, giving a depth on vein of 110 ft. Plans contemplate driving a deeper tunnel at a point 1000 ft. farther down mountain slope, whereby the vein will be intersected at 700 ft. depth, by driving 1000 ft.

Lordsburg.

This district is quite busy, the silicious ores being in good demand at the smelters. The 85 is working full shifts in an

effort to ship 15,000 tons of ore this month to meet the requirements of the smelters. The shipments will be proportioned between the El Paso and the Douglas smelters; the freight rates being about the same on shipments going either way. All arrangements are completed for the installation of the new Atlas Deisel engine which is expected in a few days. It will be the second unit of 450 h. p. installed at this property. Construction will shortly begin upon a 40-room hotel at the camp.

The Bonney is working full shifts on Shafts No. 1 and 2. In No. 1 shaft a drift is being run in ore on the 220-ft. level to undercut a good showing of red oxide ore that was cut on the 175-ft. level; the ore body here being 3 ft. of red oxide carrying high values in gold, silver and copper, within a vein of lower grade that shows a face of 7 ft. from the foot wall; no hanging wall having as yet been encountered. Two carloads of ore secured during development will be shipped this week. On shaft No. 2 good ore has also been found at the 300-ft. level; a drift has been started to undercut this ore body. A full force is working unwatering shaft No. 3. When completed, drifting will be started both ways from the shaft upon a deposit of rich sulphides known to exist upon the 400-ft. level. A new strike of sulphides ore assaying from \$70 to \$90 has been struck on the East end of the Lone claim, one of the Bonney group, on ground leased by M. Alercon.

Development on the Weldon property, which adjoins the Bonney on the north, has reached a depth of 75 ft. A strike was recently made of some high-grade copper sulphides carrying good gold and silver values. A lease has just been closed on the claim by H. H. Wells of Lordsburg, who is preparing for considerable development.

J. Robinson, who has a lease on the Manilla group, which joins the Bonney on the east, will ship a car of ore this week.

Mogollon.

At the Johnson mine, purchased from The Oaks Co. by Socorro Mining & Milling Co., some time past, the new shaft has reached a depth of 200 ft. and had good ore most of way down. Thus far there has been no trouble from water.

Sinking of shaft below 500 level has been started at Pacific mine and it is the intention to continue to the 600 with allowance for ore pockets and sump. Drifting is being conducted on several levels. Leyner machines are used, the compressor operated by electricity from plant of the Socorro Co.

A raise started from tunnel level on Clifton mine by The Oaks Co. the past week encountered a good grade of mill ore. Other development headings on both the Clifton and Eberle are also yielding pay rock.

Louis Cramas, owner of Gold Eagle group, is about to resume operations. Some 400 ft. of tunnels and 80 ft. of shafting has been done, a large part of which was in ore, and the last few shipments to custom mill indicated a value of \$14 to \$16 per ton.

Socorro Mining & Milling Co. shipped approximately 70,000 ozs. bullion from operations in August and the Mogollon Mines Co.'s output for period was over 50,000 ozs., a total of more than 3½ tons of gold and silver for the month, in addition to several tons high-grade concentrates. From a portion of this district 3 miles wide by 5 long more gold and silver is being regularly produced than in all the balance of New Mexico combined.

Leidendorf.

Randell and Crocker, leasing on the Nelly Bly, are shipping an average of a carload a week, principally copper sulphides with some bornite, all of their shipments being from above the 60-ft level.

OREGON.

Sumpter.

Four carloads of wood pipe are now at the Congar mine and will be used in constructing a water supply line for the mill. It will run from Granite creek to the mill.

The Virginia mine is being operated by Able and Petty

and they are now hauling the ore to their stamp mill near the Greenhorn.

Greenhorn.

Bishop, Calif., interests are examining S. C. Richardson molybdenite property and also a chrome property located this summer.

Larsen and Dixon are fixing up their lately discovered gold property on Olive creek. They have a shaft house and hoist ready. The shaft is partly timbered so that work can proceed during the winter months without interruption.

The Psyche ore is being hauled to the Blackhawk mill for treatment.

SOUTH DAKOTA.

Lead.

With a 300-ton cyanide mill on the ground development with 6 men has progressed during the past 6 months so that Harry Griffith and associates see it possible to profitably operate the Bismark mine. The possibility of treating low grade ore at a profit was demonstrated during the time that Fred Hitchings was in charge of the operations. They know the quality of ore that must be uncovered and it is understood their prospecting has brought them in contact with a considerable quantity of rock that is known to be of commercial value. The 300-ton mill is in good condition and with a small amount of repairs, will be ready for use.

Custer City.

The 12-ft. vein of gold ore is now well opened at the Grimshaw property on Elk creek. This vein of gold bearing ore has been opened by a shaft 135 ft. deep and has been drifted on for 500 or 600 ft. Besides these, which are the principal workings, the vein has been exposed in a number of other short tunnels and pits, and wherever exposed the ore taken from it and from its croppings have assayed well. Many samples have been taken from the shaft and tunnel which have gone \$12. After the last samples which have been taken are assayed and the returns received preparation will be made for the resumption of development. It will be continued in until the vein has been opened up at depth, and followed along the course of it in the main tunnel. The vein also carries values in copper. Some fine rock has been taken from it, that will go at least 2% copper. For the present the attention of the owners will be directed to further developing the gold possibilities. The vein is on the strike of the Clover Leaf vein, which has produced so much very rich ore.

UTAH.

Alta.

Open cut work for starting a new tunnel at the Wasatch is nearly complete. When driving underground has started, 2 machines will be employed in the heading and two shifts employed and perhaps three shifts will be put to work. With two shifts the tunnel will be advanced at a rate of between 325 and 350 ft. per month. The long open cut, which is about 12 ft. wide, will be covered to protect it from snow-storms. All of the buildings that house the machinery have been completed. The tunnel is to be 7 by 9 ft. in the clear, and it will be more than 400 ft. long. The portal is located at the extreme southwestern portion of the company's holdings. A large ditch will be cut on one side of the tunnel to take care of the water, as it is expected that a considerable flow will be encountered. The bore will give an additional depth of 300 ft. below the 400 level and will make available the ore bodies in the bottoms of the old stopes. These stopes were mined down to the level of the Columbus tunnel, and it is believed that all territory in that vicinity will be drained by the new tunnel.

American Fork.

After nearly 7 years of idleness a contract for 500 ft. of tunnel at the Mineral Flat Co.'s property has been let. The main tunnel is in a distance of 2100 ft. The first 150 ft. was driven through the side rock, the next 300 ft. through limestone shale lying above the quartzite, after which the tunnel

penetrated the limestone formation proper. The limestone dips away from the direction in which the tunnel is being driven and the middle member of the series is a gray soluble limestone, in which the ore occurs. The objective of the tunnel is to cut the middle member where it is intersected by one of the main ore-bearing fissures. This fissure strikes northeasterly and dips northwest. There are four porphyry dikes traversing the property parallel to fissures. The ore croppings on the surface where the fissures are exposed consist of iron, with lead and silver scattered through the mass. The company owns its power plant, connected with 4000 ft. of 10-in. water line and a 4-in. air line in the tunnel. The plant develops sufficient power to run 6 drills. The company has leased the plant to the Red Cloud Co., which is putting the plant in repair and will furnish Mineral Flat air.

At 1500 ft. from the portal a crosscut to the east has been started to explore the overthrust contact, known as the Cardiff. At 1200 ft. from the portal a crosscut was started west to get under the Brockbank tunnel, now in 600 ft. It will be tapped by a raise 187 ft. in height, which will drain it and make possible exploration of ore stringers that have been cut. The west crosscut will be driven ahead to cut the west limestone-quartzite contact. The Brockbank tunnel will also be continued to explore the system of fissures traversing the area.

Beaver.

The Croff Mining Co. has let a contract for sinking the shaft an additional 100 ft. The ore body was struck in a crosscut from the shaft driven from the 155 level. The fissure in which the ore was opened was first encountered in the Lucky Boy shaft, at the 55 level. At that level it was 2½ ft. wide. When it was opened on the 155 level and crosscut it proved to be 9 ft. wide. This increase in width in an additional depth of 100 ft. indicates the strength of the fissure, and it is expected that it will be found quite as wide when it has been opened at the 255 level.

At the Leonora a 6-in. vein of copper-silver has been encountered. The strike was made in the face of the drift being driven on the east-west fissure. The showing is being followed to the east. Work has been done on the property in the past few months for prospecting the contact between the monzonite and limestone. This contact was cut in driving along the north-south fissure which intersects it. In driving along the north-south fissure miners encountered its intersection with the east-west fissure and a showing of ore was developed. The work of driving to the contact was continued, and when it was reached considerable work was done along it, both to the east and west of where it is intersected by the north-south fissure. Recently Superintendent Nebeker started miners driving east along the east-west fissure, which has resulted in striking ore. This has been cut at a depth of 325 ft. One promising indication is the prevalence of quartz that is increasing in the fissure as the work is pushed forward. The ore showing has been improving and Nebeker is of the opinion that ore in commercial quantities will be opened when a more favorable limestone formation is reached.

Fortuna.

A well defined dike has been under development for the past 2 months by the Independence Gold Mines Co. The results have shown that there is gold values that were not expected. It is the intention of the company to put down a shaft close to the dike and crosscut to prospect it. It has been traced for a distance of 1500 ft. and for 6 to 20 ft. on the ledge good values are shown. For 200 ft. from 6 to 8 ft. of vein matter can be shown that carries \$6 to \$8 gold. The shaft now being put down is by hand, but it is the intention to shortly put in machinery. On the Paymal property some high-grade ore has been found recently and one sample, which was picked, showed 85 ozs. gold, although the entire face in the tunnel shows 6 ft. of \$50 ore.

Park City.

The 750-ton plant of the Big Four Exploration Co., for treating tailings, has been completed. It has reached a capacity of 400 tons and will increase until it has reached its rated capacity. About Sept. 20 it should have reached its capacity and then the management announces that it will be earning net profits at the rate of \$30,000 a month. Additional

flotation equipment will be installed soon and the capacity will be raised to 100 tons. On this operation the Big Four officials announce that profits will be at the rate of \$40,000 a month. The Big Four blocked out the tailings and had them carefully sampled before starting mill construction. It has been demonstrated that the tailings deposit is 3½ miles in length and 600 ft. wide on the average. The average depth is 5 ft. and all this has been sampled from the grass roots to 18 ft. below surface. It will be the policy of the company to make quarterly disbursements to stockholders. A surplus will be built up that will give the company ample capital to engage in other mining enterprises.

According to President W. R. Elliott the fissure being followed below the 500 level in the Three Kings property is widening out and the vein matter is containing more mineralization. The winze is down 70 ft. below the level on the No. 1 fissure and has broadened out from 18 ins. to the full width of the winze. The shaft at the property was started on the Park City formation. This has continued all the way down, and where the present work is being carried on it has a depth of 750 ft. in the formation. As a usual thing the ore bodies are found on the contact between the Park City formation and the quartzite and this varies from 750 to 850 ft. The winze being sunk on the No. 1 fissure, encountered in running a drift on the 500 level, is being put down to cut through this formation to the contact. A little air hoist has been installed at the winze and is giving satisfaction. Thus far the work has been through a series of lime beddings. Thus far the mineralization in the vein has been increasing. In the vein is found a well mineralized lime and quartz, which contains from 8 to 9 ozs. silver.

WASHINGTON.

Spokane.

The influence that the establishment of automobile stage and freight lines into the regions surrounding Spokane is having on the mining industry is indicated by the fact that the Columbia Copper Co., whose holdings are near Turk, is shipping its product to Spokane by one of the auto-transportation companies, the ore being delivered here to the Great Northern railway for delivery to the Canadian Con. smelter at Trail. The ore is transported by teams and automobiles to Davenport, where it is turned over to the Spokane-Davenport Auto-stage Co. for delivery at the railway in Spokane. The cost of hauling from the mine to Davenport is \$8 the ton, and the stage rate from Davenport to Spokane is \$2.80. Regular consignments are arriving daily in Spokane, and the management of the mining company states that the freight charges are materially less by auto stage from Davenport than by the Northern Pacific railway.

The Gem Mining Co. has been incorporated in Spokane to develop the Stepstone group of eight claims 10 miles north of Nespelen on the Colville reservation. The incorporators are: Walter L. Jones, president; Otto H. Gerboth, vice-president, and Grant J. Bowman, secretary-treasurer. The capital stock consists of 1,500,000 shares at 10 cts. each, of which one-half will go into the treasury. "On one property a tunnel was run 20 ft. and crosscut a stringer of zinc and galena that ran from \$25 to \$50," said Mr. Bowman. "Another tunnel about 80 ft. lower on the hill was driven with the expectation of striking the same stringer at a lower depth. Before the stringer was reached a solid body of iron ore was encountered. In this are gold, silver and nickel in small values. On another claim the shaft is down 80 ft. and it is said there is a foot of nickel here and 14 ft. of lower grade matter containing nickel and cobalt. We intend to put men at work at once."

WISCONSIN-ILLINOIS.

Highland.

Shipments of carbonate zinc ore are beginning to come from new producers, the Saxe-Lampe shipping its initial car,

30 tons, to Mineral Point; Simmons-Richter Co. to Sandoval Zinc Co., 1 car, 26 tons; New Jersey Zinc Co. to Mineral Point, 3 cars, 75 tons. Another new outfit is going into commission for the New Jersey Zinc Co. and shipments are being arranged from the Red Jacket mine, idle several years.

Linden.

Improved tone was shown here last week on shipments, the Linden Zinc Co. shipping 1 car high-grade, 40 tons, to Lanyon Zinc Co.; Milwaukee-Linden Development Co. to Cuba, 42 tons; Optimo No. 3 to Linden Zinc Refinery Co., 4 cars, 143 tons; Stoner Mining Co. to Mineral Point, 30 tons; Ross Bros. Co. to Mineral Point, 30 tons; Linden Development Co. to Cuba, 40 tons; Saxe-Pollard Co. to H. Lewis for Eagle-Picher Lead Co., 32 tons. The reserve is estimated in excess of 2000 tons concentrates. Numerous strikes have been made recently, one on the Vial land adjoining the Ross mine, showing 8 ft. of milling area, up and down. A new company is being organized on this property.

Cuba.

Receipts of ore at the National Refinery were 18 cars last week. Shipments were light on finished product, 1 car going to Illinois Zinc Co., 40 tons, and 4 cars to Granby Con., 163 tons.

Platteville.

Reports for the field for week of Sept. 16 show shipments of 167 cars of zinc ore from mines and separating plants for a total of 6831 tons. Only 1 car of lead ore cleared, 56,000 lbs.; iron pyrites from separating plants, 570 tons. The gross recovery mine run ore for the week totaled 5800 tons crude ore; net to smelters, 2798 tons. The Mineral Point Zinc Co. shipped 12 cars refinery ore to smelter at DePue, 490 tons. Prices for zinc ore remained stagnant, standard 60% ore and top grades going on a base of \$56, with the range down to \$50 for medium and second.

Local conditions in the Platteville district showed improvement; Klar-Piquette, Mann & Harding, East End, Hodge, Star and Block House Mining companies shipping a total last week of 15 cars, 711 tons. The Klar-Piquette mine, after years of successful operations and the payment of \$200,000 in dividends, is pulling up pumps and will abandon the mine. Low prices and low-grade production is offered as the cause of this suspension.

Montfort.

The O. P. David mine shipped 3 cars of zinc ore last week, 1 to LaSalle, 40 tons, and 2 cars to Sandoval Zinc Co., 89 tons. Production is being increased from new ground showing heavy deposits of much improved quality.

Potosi.

The Wilson mine was included among shippers last week, shipping 1 car concentrates, 60% zinc, to LaSalle.

Hazel Green.

Old producers alone reported last week. Kennedy to Mineral Point, 5 cars, 200 tons; Cleveland mine to Cuba, 2 cars, 80 tons; Lawrence mine to Wisconsin Zinc Co.'s refineries, 3 cars, 122 tons. Monmouth Zinc Co. is installing the heaviest pump equipment yet supplied to any of the mines of this field. Production is maintained and several hundred tons of ore have accumulated in bin.

Benton.

Reports for week of Sept. 16 show shipments to have reached the highest point ever recorded for the district, 80 cars of mine run ore reaching track for a total of 6,800,000 lbs. Not all the shippers were accounted, for a scarcity of cars prevented others from getting to track, while several cars were in process of loading, which did not clear in time to be included in the figures given. Vinegar Hill Co. turned in 12 cars to Cuba; New Jersey Zinc Co. to Mineral Point, 15 cars; Frontier Mines Co., 10 cars; Champion of the Wisconsin Zinc Co., single-handed, 12 cars, 557 tons; Grand View, a new producer, shipped 3 cars to Cuba, 118 tons; Sally Mining Co., another new producer, 3 cars to Galena, 131 tons; Wisconsin Zinc Co., Skinner refining plant, all high-grade ore, 14 cars, 550 tons; Fields Mining & Milling Co. to separators at Galena, 4 cars, 190 tons; the Wilkinson Mining Co., a new producer, 3 cars to Mineral Point, 120 tons. Extensive developments are under way for the Frontier Mining Co. on the Hird mine, fully equipped and being placed in

shape for heavy production. Drills checking up the ranges on other allotments have been rewarded with phenomenal strikes and heavy turnin of zinc ore is assured for a dozen years to come. On the Grotkin land a new shaft is in ore and a new plant will be provided. In the New Diggings camp production is under way on new ore for the Wisconsin Zinc Co. in the C. A. Thompson mine. Other producers are coming to the front. The Vinegar Hill Co. has begun the construction of a new 200-ton plant on the Meloy land, drilled out extensively with great results.

Shullsburg.

The Oliver Mining Co. makes its initial shipment, 3 cars to Edgar Zinc Co., 122 tons. The surface equipment includes everything essential to a Wisconsin low-grade producer. An independent unit refines ore as quickly as delivered from the concentrator. The Winskill mine delivered 5 cars last week to Galena, 214 tons.

Galena.

Black-Jack shipped 4 cars last week, 150 tons; Galena Refining Co., 3 cars high-grade, 122 tons; Birkbeck, a new producer, made shipment of 1 car, 40 tons; Federal mine, another Wisconsin Zinc Co. producer, 3 cars, 120 tons; Day Mining Co., a new one, to Cuba, 40 tons; North Unity to Cuba, 3 cars, 131 tons; Wisconsin Zinc Co. to LaSalle, 2 cars, top-grade, 73 tons.

Miffin.

Peacock Mining Co. is shipping again. The Cokers shipped 8 cars to Mineral Point, 337 tons. Other local producers were not reported, low-grade ores being in poor demand. The reserve in this district is estimated at 1800 tons.

WYOMING.

Cheyenne.

The assets of the United Smelters & Railway Co., which was formerly the Penn-Wyoming Copper Co., will be sold on Sept. 21. The total amount of claims is \$2,376,750 and bonds of subsidiary companies will be sold as follows: \$518,500 Saratoga & Encampment Ry., \$500,000 Encampment Smelting Co., \$100,000 Encampment Pipe Line Ditch Co., \$50,000 Emerson Electric Light Co., \$350,000 Encampment Tramway Co., \$50,000 Encampment Waterworks Co., \$800 Encampment Land & Town Lot Co., \$750,000 Battle Lake Tunnel Site Mining Co., \$1,000,000 Haggarty Copper Mining Co., \$20,000 Carbondale Coal Co. and \$22,000 North American Mercantile Co.

CANADA.

BRITISH COLUMBIA.

Silverton.

The most important strike ever made in the Standard Silver-Lead Mining Co. operating the Standard mine and mill, was encountered last week in the Alpha claim. "It is the finest ore showing of the kind I have ever seen," said Martin Welch, one of the owners of the Echo mine, adjoining the Standard, who inspected the property soon after the strike was made. "The showing is in the upper Alpha tunnel, and the face shows 9 ft. of solid galena that averages 75% lead and 200 ozs. in silver, the high silver values being due to the presence also of grey copper in the ore. The extent of the deposit has not been determined as neither wall has been reached. Another tunnel on the Alpha, about 100 ft. lower, has tapped this same ledge, but it will have to be driven between 70 and 80 ft. to get under the new showing. About half of the face of the tunnel is in ore of the same character and value. These workings are in the upper portion of the Alpha claim, which adjoins the Echo, now owned by the Echo Mining Co., in which E. F. Burns, John Jordan, Jack Thompson and myself are the controlling factors. We opened the ledge by a tunnel starting on the Alpha claim which is on nearly the same level as the upper tunnel recently driven by the Standard. It shows a long shoot of good concentrating ore with some ore of shipping grade mixed through it and appears to have explored the vein just above the apex

of the ore shoot found by the Standard, whose workings are now within 30 ft. of our line in their upper tunnel. The lower tunnel is being driven by them and us jointly and is about 100 ft. from our line. A little further down the hill than the new workings the former owners of the Alpha took out ore to the value of \$140,000 from a small glory hole several years ago. The ore body proved to be isolated and not in place. It is evident that it had broken away from a ledge higher up the hill, but they never made any effort to locate the vein. There is absolutely no doubt in my mind that the new workings of the Standard and ourselves are on the ledge from which this ore body broke away. The ore in the new workings is of the same character as came from the old glory hole, which was notable at that time for its high silver values and remarkable showing of grey copper."

The directors on Sept. 15th declared the regular monthly dividend of 2½ cts. a share, or \$50,000, on the issued capitalization of 2,000,000 shares, payable Oct. 10 to stockholders of record Oct. 1. This will make the 1916 disbursements \$500,000, and will increase the total payments to \$2,300,000, or \$1.15 a share, 15 cts. a share more than the par value.

Trail.

During the last week of August 15,134 tons were shipped to the smelter here. This is nearly 50% larger than during any previous week. The total for the month was 47,620 tons. Mines which made their initial shipments this year during the last quarter of August were: Burton, East Kootenai, 20 tons; Quantrel, East Kootenai, 17 tons; Vancouver, Salmo, 23 tons; Lucky Jim, Bear Lake, 75 tons; Panama, Bear Lake, 29 tons, and Silver King, Nelson, 3 tons. The Vancouver group is a free-gold property adjoining the Queen mine in the Sheep Creek district. The Panama is situated in the dry ore belt above Bear lake, which is the source of Kaslo creek, and is owned by A. Giegerich. It has been an occasional shipper in the past, and its product is high grade silver. The Lucky Jim shipment was doubtless made to Trail because of the expiration of its contract with eastern smelters in United States pending the obtaining of new smelter contracts, in connection with which Receiver A. G. Larson is now in the east.

The following table shows the deliveries of ore at Trail during the last week of August and during the entire month by those mines or companies which have a special interest to Spokane people by reason of their control or ownership being wholly or largely held here: Center Star, Rosslund, 5016; Le Roi, Rosslund, 3808; Le Roi No. 2, Rosslund, 483; Sullivan, East Kootenai, 2603; St. Eugene, East Kootenai, 96; Giant, East Kootenai, 20; Burton, East Kootenai, 20; Quantrel, East Kootenai, 17; Emerald, Salmo, 148; Vancouver, Salmo, 23; Enterprise, Slocan, 34; Galena Farm, Silverton, 76; Standard, Silverton, 248; Slocan Star, Sandon, 33; Rambler-Cariboo, Slocan, 79; Idaho-Alamo, Slocan, 41; Gallagher, Ainsworth, 20; Highland, Ainsworth, 224; Florence, Ainsworth, 3; Electric Point, Boundary, Wash., 357; United Copper, Chewelah, Wash., 225; Keystone, Bayview, Idaho, 68; Panama, Bear Lake, 29; Lucky Jim, Bear Lake, 75; Silver King, Nelson, 3; other mines, 385.

Slocan.

W. T. McCurry on returning from this district says: "A strike of more than ordinary importance has just been made in the No. 1 group, between the Reco and the Noble Five properties, which is owned by John M. Harris of Sandon and Jack Whittier of Vancouver, B. C. The Slocan Star is making good progress with the construction of its hydro-electric plant and the installation of the flotation unit in connection with the concentrator. The most important operations in the Salmo district are those of the Hudson Bay and Emerald mines. Both are shipping steadily, the former zinc and the latter lead-silver ore. Shortage of water for power is handicapping development of the Hudson Bay, but it is advancing its lower tunnel at the rate of about 6 ft daily. One of the most fortunate operators in the district is Clarence Cunningham. He is working three properties—the Wonderful, Queen Bess and Sovereign. He has been shipping from both the Wonderful and Queen Bess for some time, having opened up good bodies of ore in both. He broke into ore in the Sovereign, after advancing the drift run by his predecessor only 40 ft. The new showing consists of 22 ins. of clean

galena averaging more than 100 ozs. silver. Another mine in which work was recently resumed is the McAllister property, on the north fork of Carpenter creek in the dry ore belt. They are drifting both ways from a crosscut tunnel at a depth of 250 ft. and in one face they have 5 ins. of high-grade silver ore. The last shipment from the property went better than 250 ozs. silver."

Grand Forks.

The Union mine at the Franklin camp is now making shipments by auto trucks at the rate of one and one-half trips a day. Manager Johnson says one truck is equivalent to three 4-horse teams. The ore is being hauled from Union to Lynch creek.

The Seattle mine on North Fork is shipping at the rate of 6 cars per week.

ONTARIO.

Cobalt.

The best find of late at the Nipissing is in 81 shaft. The Cobalt Lake fault was encountered at the 424 and 520 levels, after crosscutting 159 and 232 ft. respectively. At both levels the condition of the fault is the same. It has a width of 12 ins., contains some calcite, and assays from 4 to 6 ozs. silver. Sixty-seven feet of drifting has since been done at the 425 level and 50 ft. of drifting at the 520 level without any improvement in the condition of the vein. At 80 shaft work has been confined to exploration into undeveloped and favorable territory at the 315 and 380 levels. No veins have been encountered to date. At the 200 level some tonnage was withdrawn from the old stopes. At vein 102 some drifting was done at the 155 level. Results were not encouraging. The vein is being further developed by two raises. Drifting has been started at the 90 level to prospect this vein. At this level it is small, but is usually of sufficient value to send to the low-grade mill. A crosscut is being driven at the 90 level toward vein 96, which shows from 1 to 2 ins. of ore assaying 2000 ozs. at the tunnel level.

Boston Creek.

With starting the steam plant again at the Miller Independence it is intended to continue development uninterruptedly. The No. 2 vein, located a short time ago, is showing up well. Two test pits have been sunk and specimens show free gold and tellurides. The vein was 10 ft. wide where first uncovered at surface, but stripping has shown that place to be a bulge, as the vein is narrowing down as it is uncovered to the east. No. 1 vein has not made its appearance yet, after about 60 ft. of crosscutting. It was thought that at the angle on which the vein was dipping, sinking a shaft 150 ft. north would cut it at about 50 ft. The shaft was put down 75 ft. before crosscutting. If the vein is not cut shortly it will be followed from surface.

Porcupine.

A new compressor has been ordered by the Premier Mining Co. and when this is installed sinking will be continued to the 500 level. The vein found in the south crosscut shows about 15 ft. of ore that will average \$10. The new vein was found 180 ft. south of the vein upon which the shaft was sunk in the contact between quartz porphyry and Keewatin formation. Previous to starting the crosscut all work underground had been done on a vein showing free gold. A new road, partly macadamized, has been built into the property from the Dome Lake. Two 60-hp. boilers, locomotive type, will drive the compressor.

The new vein system on which a shaft was sunk during the summer at the Newray mine has been lost by faulting and a search for it is now being made. The vein has been traced a considerable distance. On the surface it has widened to 20 ft. in places. A previous sampling gave good average assays and of all the channel samples taken along the vein there were no blanks. Another sampling is now being made which will include that large portion of the vein since stripped on the surface and if equally good values are found in the averages a crosscut will be made at the 400 level to cut the vein at that depth. Diamond drilling is under way in an endeavor to locate the lost vein in the shaft. Developments have been so satisfactory in connection with the new find and Manager Charlebois considers its development equally as important as that of the original find.

World's Index of Current Literature

A Weekly Classified Index to Current Periodical and other Literature, Appearing the World Over Relative to Mining, Mining Engineering, Metallurgy and Related Industries, in Four Parts.

Part 1. *Geology*—(a) Geology; (b) Ore Genesis; (c) Mineralogy.

Part 2. *Ores and Metals*—(a) Metals and Metal Ores; (b) Non-Metals.

Part 3. *Technology*—(a) Mines and Mining; (b) Mill and Milling; (c) Chemistry and Assaying; (d) Metallurgy; (e) Power and Machinery.

Part 4. *General Miscellany* (including Testing, Metallurgy, Waste, Law, Legislation, Taxation, Conservation, Government Ownership, History, Mining Schools and Societies, Financial, etc.

Articles mentioned will be supplied to subscribers of Mining and Engineering World and others at the prices quoted. Two-cent stamps will be received for amounts under

\$1. Subscribers will be allowed a discount of 5 cts. if the price of the article exceeds 50 cts. The entries show:

(1) The author of the article.

(2) A dash if the name is not apparent.

(3) The title, in italics, of the article or book. Titles in foreign languages are ordinarily followed by a translation or explanation in English.

(4) When the original title is insufficient a brief amplification is added. This addition is in brackets.

(5) The journal in which the article appeared; also the date of issue, and the page on which the article begins.

(6) Number of pages. Illustrated articles are indicated by an asterisk (*).

(7) The price.

December.....	55.038	26.232
Year.....	49.690	23.470

Difference in domestic and foreign prices explained by the fact that the New York quotations are per fine ounce; the London per standard ounce 8.925 fine.

Copper.—There has been no abatement in the buying of copper. Domestic users have been steadily placing orders covering requirements over the balance of the year and at this writing few of the leading producers possess any unsold metal for November, while supplies for December delivery are restricted. The pith of the copper market is that demand is in excess of the supply. The copper market today is not a competitive affair. If one interest cares to sell quickly and lowers its price a quarter or a half cent the other producers do not hasten to take similar action. They know that eventually orders will come at the prices they demand. This substantially has been the case in the past week. One of the large interests last week booked a tremendous business, but it was learned that the orders were obtained by slight price concessions. The other producers reported very good orders also at their prices. Brass makers and wire drawers took about 75,000,000 lbs. copper last week, while export business easily amounted to 25,000,000 lbs. Many of the sales called for delivery over the first quarter of next year. One brass mill took 20,000,000 lbs. for delivery over the first half of 1917.

Of prime interest is the pending order for copper to be placed by the entente allies. Copper factors have been constantly discussing this matter, but are reticent as to details. It is learned on the highest authority that the amount is the largest ever taken by the allies, and indications are that the order will be closed while this issue of Mining and Engineering World is being printed. One copper producer intimated that 500,000,000 lbs. may be purchased, on which deliveries are to run over the first half of next year. It is learned that the business will be distributed among all of the producers instead of a select few as previously.

The price situation shows no change aside from a stronger feeling on the part of dealers, who are holding spot and October electrolytic at 28 cts., while for November and December dealers ask 27³/₄ cts., with the first quarter of next year held at 27¹/₄ cts. These prices are about a half cent higher than those previously quoted by dealers. On the other hand the large producers are taking orders for the last quarter at a flat price of 28 cts., with October sold at 28³/₄ cts., November and December at 28 cts. Spot casting copper holds firm at 26¹/₄@26¹/₂ cts. In connection with the pending allied order certain well-informed factors state that 26 cts. will be the price on the immense tonnage.

Consumers are resorting to all means at their command to cover needs over the fourth quarter. It is generally ad-

mitted that there is a scarcity of copper. Some users have placed their inquiries with all of the large producers. This accounts for duplication as to the total active business in the market. However, producers assert that the amount of business that they have declined has been extensive in itself. One producer is sold out for November; in fact, oversold to the extent of 800 tons; another declares that he can take orders for about 2,000,000 lbs. more for that month. Few of the large sellers report unlimited stocks for November. Users who sought October copper failed in many instances to secure full allotments.

Labor conditions alone will be the prime factor in solving the copper situation. As pointed out by one large refiner, capacity can be increased two-fold, but if labor is unobtainable then refinery yield will not increase. Thus there are many who believe that refinery yield will not go over 180,000,000 lbs. a month by the end of the year. Among the eastern refineries labor is extremely scarce. The western refineries are also affected, but not so seriously.

At London the market has been steadily improving. Last week electrolytic advanced £3 10s, while standard advanced £6 in spot and £4 10s in futures. With respect to the official London quotations it is believed that the prices cabled are well below the actual market values and although there still remains some interest in fluctuations abroad, the influence that these changes have on this market is nil. The stocks of copper in Europe on Sept. 15 totaled 7118 tons, as contrasted with 7514 tons on Sept. 1. The supply afloat was 5550 tons, as against 5000 tons a fortnight ago. The visible supply on Sept. 15 totaled 12,668 tons, as against 12,514 tons on Sept. 1, an increase of 154 tons.

Exports of copper in August totaled 32,190 tons, making the total exports reported since the first of the year 215,199 tons, as against 171,786 tons in the same period of 1915. Since the first of September exports reported total 12,635 tons.

Quotations for copper per pound at New York for the week ended Sept. 20 were as follows:

(For Fourth Quarter Delivery.)

Tin.—The market was a quiet affair last week, but despite the dullness prices were firmly held. Consumers were not interested in forward positions, while some tin just ex-steamer was slightly shaded by sellers, who preferred to take a lower price rather than put the tin in store.

Spot Straits ranged from 38¼ to 38½ cts. since our last report, while spot Banka held from 37¼ to 37½ cts. Some business in Banka was done at 37 cts. No. 1 Chinese tin was quoted at 37 cts. At this writing Straits tin for September delivery is quoted at 38¾ cts., with October held at 38¼ cts., November and December at 38¼ cts. and January and February at 38 cts. Foreign markets have been irregular, but closing prices showed a net gain of 5s to 10s at London, while Singapore advanced £1 15s during the past week.

Arrivals of tin since the first of the month total 1549 tons, while the stock afloat to this country totals 3380 tons.

Quotations for tin per pound at New York and per ton at London and Singapore for the week ended Sept. 20 were as follows:

Month.	New York		London, Straits, spot.	Singapore, shipments.
	Spot.	Futures.

Lead.—On Tuesday the American Smelting & Refining Company advanced its price 25 points to 7 cts. New York and 6.92½ cts. St. Louis. Independents topped this advance by 10 to 20 points asking 7.20 cts. New York. The market is now at a standstill pending indications as to how the advance will affect buying. It is thought that consumers will readily concede the higher prices.

Spot metal is very scarce. Few of the independents have lead for September delivery. Canadians bought freely, while other export business is also noted. Lead for October delivery sold at 6.90 cts. New York and some sellers asked that price for November delivery. Just before the A. S. & R. Co. announced its advance an independent gave an option on 1000 tons for export November delivery at 6.75 cts. New York, which was exercised on Saturday. Domestic users were also in the market for a substantial amount of lead. Some large cartridge contracts have been placed in this coun-

try. Generally the lead situation is very tight. Indications are that lead will remain scarce over the rest of the year.

Quotations for lead per pound at New York and per ton at London for the week ended Sept. 20 were as follows:

Lead Ore.—The change has come in the ore market of the Missouri-Kansas-Oklahoma district and ores were up \$5. The best grades sold as high as \$75, though the greater part of the ores went at \$70. Production for the week was up again and was recorded at 2,205,215 lbs. for the week ended Sept. 16, this bringing the total for the year to date at 74,772,962 lbs. The week's production was valued at \$76,480 and the year's at \$3,131,461

Year				53.34

Zinc Ore.—Though the top price of this ore showed no change from the previous week's in the Missouri-Kansas-Oklahoma district, the general tone of the market was stronger in that all of the lower grades were in better demand and brought higher prices. The top price paid was \$65, but this ranged only down to \$50 rather than \$45, as during the week ended Sept. 9. There were produced during the week 13,109,486 lbs. of concentrates, bringing the total for the year to 465,215,930 lbs. and these amounts had respective values of \$389,980 and \$20,472,821.

Calamine.—The market remained about the same, with prices ranging from \$30 to \$40. Production of late has been low and during the week ended Sept. 16 276,300 lbs. were produced and valued at \$5442. The year's production to date is 21,048,910 lbs., valued at \$745,788.

Spelter.—Business in spelter has been very brisk. The heavy buying of copper by brass makers has also resulted in a very large demand for spelter and producers have taken some very good orders for the fourth quarter. Demand for

brass special and also for higher grades has been good. Export buyers took some round lots of brass special. Spot prime western advanced $\frac{3}{4}$ ct. last week and continues to move higher this week. There is very little spot to be had. For the fourth quarter sellers took business at prices ranging from $9\frac{1}{2}$ to $9\frac{1}{2}$ cts. St. Louis, the outside price prevailing at this writing. Sales of brass special for spot delivery were done at $10\frac{1}{2}$ cts. St. Louis. For the first quarter of next year some dealers offered prime western at 9 cts. St. Louis. Canadians took about 500,000 lbs. spelter, France bought a round tonnage, while the amount taken by one large Connecticut brass maker is estimated at close to 3,000,000 lbs. The point uppermost in sellers' minds is whether spelter has come back. The production figures and statistics of increased capacity always loom up to combat the belief that spelter will again go above 15 cts. Last week at London spot advanced £4 and futures £3, with further advances reported this week.

Quotations for spelter per pound at New York and per ton at London for the week ended Sept. 20 were as follows:

MISCELLANEOUS METALS.

Quicksilver.—The market held unchanged at \$75 per flask for spot virgin metal during the past week. Business has been of small volume, but sellers assert that the price has been firmly established. Imports are fair. Hope is entertained that some large powder orders will soon be placed that may cause a better demand for mercury. In the meantime sellers are taking few orders.

Antimony.—Business continues of very small account, but sellers appear to be holding the market firm at 11@12 cts. for spot. Chinese interests are offering freely, but consumers are well covered and are not disposed to accept metal at the concessions.

Tungsten Ore.—Prices continue to decline on tungsten ore on freer offerings by sellers. There is only a fair demand and some interests are holding good-sized stocks. Offerings to consumers are noted at \$15@17 per unit delivered New York. Some export business has been done, the entente allies being in the market.

Aluminum.—The market has been very quiet, but prices are firmly maintained. Sellers are not pressing supplies on the market, holding to the opinion that there will be an early improvement in the demand. Spot virgin ingots are quoted at 61@63 cts. per pound in ton lots. For No. 1 remelted sellers ask 58@60 cts., while No. 12 alloy can be had at 46@48 cts. On contract renewals for 1917 sellers are asking 35 cts. f. o. b. smelter on virgin ingots. Aluminum sheets are in fair demand, with job lots for prompt shipment held at 80 cts. to \$1. For automobile body sheet sellers quote 90 cts.

Ferromanganese.—As a result of the domestic competition and the fact that English makers are unable to guarantee regular shipments prices on English ferromanganese

have been lowered to \$165 seaboard. Domestic furnaces are also offering at the same price. One Philadelphia interest has taken orders for about 4000 tons domestic alloy in the past week.

Pig Iron.—Business continues on a large scale, especially in basic iron, for which there has been widespread buying. Sales of about 110,000 tons basic iron were reported last week. A fair amount of foundry iron was also sold. The situation generally reflects the endeavors of large users to cover first half needs before prices are advanced.

HOISTING WORKS OF THE RICHMOND-EUREKA.

SUMMIT QUEEN MINING CO.'S PROPERTY.

Review of Conditions in the Eureka Mining District, Nevada

A. G. HILLEN.

The mines of the Eureka district should be among the most productive in the state in the future as they were in the bonanza days of early pioneering. After an absence of 12 years, during which period there have been many changes and much development, the writer is more impressed with this condition than would be an ordinary visitor. Twelve years ago it was my privilege to go through the various old properties, make examination of their workings and study the formations, both underground and through the various geologic sheets, and by contact and much field work with many individuals who had been active in the early development, many of whom are still on the ground and active in mine development work.

Studying the same geologic sheets, and visiting the same properties and many others, and reviewing development during this period, much new light is thrown upon mining conditions here at this time.

In the earlier period one was struck with the enormous production of silver, lead and gold ores, and the difficulty of defining clearly the method of deposition of these ores, just where they might or might not be found, and defining the course, direction or extent of the fissuring or faulting of the formations. It must not be understood from these remarks that the work of Joseph Story Curtis, the geology expert of the government, who completed the survey in 1884, was not of an exhaustive character, or that his conclusions

generally were not correct. With perhaps one or two exceptions, which later development has thrown much additional light upon, Curtis' work is authoritative and complete.

To get a comprehensive view of Eureka district and mines, the topographical features may be briefly outlined. The center or greatest elevation of the district, Prospect mountain, 9600 ft., constitutes the great pivotal uplift of this area, and is situate 3 miles southwesterly from Eureka, south and east some 3 miles is the Secret canyon section, with Hoosac mountain intervening, 8500 ft., north of Prospect mountain and immediately contiguous is Mineral hill, and divided only by a small gulch on the north of Mineral hill, is Ruby hill, 7500 ft., where it has been stated there was found a \$50,000,000 outcrop of ore, perhaps the richest of any known mineral deposit in the state. Again to the north and at an elevation of 6500 ft. is Adams hill, distinguished by perhaps 200 different mine shafts and tunnels, nearly all of which produced or show ores of good grade.

The course of this plane, which with its adjacent spurs form an anticlinal fold, is nearly due north and south, except at Ruby hill, where it turns towards the west, and has a width of a half mile at its narrowest point, and more than $1\frac{1}{2}$ miles at its widest, being at least 7 miles in length, or from the Holly property on the north slope of Adams hill, to the

Geddes and Bertrand mine at the southern point in Secret canyon, 5 miles south of Eureka.

Development the past 32 years, the period since Curtis' examination and report, has gone steadily forward, with years of little or no great development, and others when development proceeded with strides and with important results. Perhaps the most active of any during this interval being the years 1907 to 1911, inclusive, when the consolidation of the Eureka Con. and the Richmond-Eureka was effected, these mines resuming development and shipments of a large daily tonnage during this period, and were purchased and operated by the U. S. Smelting & Refining Co. In 1911, the railway connecting Eureka with the main line of the Southern Pacific, was washed out by heavy floods, and a general financial depression prevailed throughout the country, and the mines were shut down.

This line of railway has been repaired, and its operation resumed, but with freight rates at \$20 per ton, and the smelters having more ores than may be profitably handled in the plants at Murray and Midvale, which are the smelting centers of the intermountain territory, the larger mines of the district still defer operations, though they are in excellent condition and may be started on 24 hours' notice.

Much Development in Recent Years.

Much development of vital importance to mining in the Eureka section has been consummated in recent years. Development of bodies of ore in contact with the porphyry, in contact with the rhyolite and in contact with what has recently been pronounced granodiorite by the University of Nevada, in contra-distinction to the classification of Curtis as being granite, but which is probably a mineralized porphyritic granite, or at least a much altered granite. At this writing, it is a matter of discussion whether the rhyolite, or porphyry, or both, do not extend the entire distance from the north end of Adams hill, southerly to and beyond the Geddes and Bertrand property in Secret canyon. There are numerous outcrops along the strike of the formations, cutting both the limestone and quartzites over this area. In some places the rhyolite may be traced considerable distances; in others the only evidence of its intrusion is in underground workings, which are extensive and would probably aggregate more than 100 miles in this 7-mile mineral area.

There are numerous lime-shale contacts, rhyolite-lime contacts, fissures and faults in lime and quartzite and ore bodies in contact with porphyry in the lime, and with an extensive faulting or fissuring system the mines have developed, the Eureka district offers splendid opportunities for development of productive mines, and many large areas where outcrops of ore are numerous, including many properties that are only partially developed, but which have pay ore exposed.

This is the condition seen in making a trip around

the district. The intrusives undoubtedly created a condition which fissured the surrounding areas of lime, making possible the deposition of extensive bodies of rich ores, by replacement of areas in the "mineralized" limestone in chambers and caves, by deposition of ore in contacts and fissures and faults, and to an extent that is beginning to be understood and appreciated.

The district has produced more than \$50,000,000 in lead-silver and gold ores, and no great depth attained, most of the production coming from above the 600 and 700 levels. There are two or three shafts below this, but difficulties of pumping water has prevented extensive development below the 6th or 7th levels in these properties. A new 1000-ft. 3-compartment shaft has been sunk on the Richmond-Eureka, and the mine equipped with a fine hoisting plant, which will go to 3000 ft. Centrifugal compound high-pressure pumps are now at the plant ready for placing in the mine when operations are resumed.

On the west side of Prospect mountain, and portions of the Adams hill area, gold and silver ores predominate, while lead-silver ores, practically all of which carry gold, run through all the mines from the Bullwacker, to the Geddes in Secret canyon, and many thousands of tons of rich silver-lead ores have been shipped from the Silverado district, and beyond to Newark and the Hamilton district, 40 miles to the east and south.

Mining Development in Various Properties.

Richmond-Eureka, comprising the former Eureka Con. and Richmond groups, have probably 30 miles of underground workings, and have produced jointly something over \$40,000,000. The property, is owned by the U. S. Smelting & Refining Co., and is equipped with a large hoisting plant, machine shops, etc., costing upwards of \$200,000. These two mines were famous for their extensive ore bodies and rich ores. Underground chambers or caves were opened in development work, containing large bodies of ore, between the 300 and 700 levels. Practically all the ores of commercial grade were reduced in local smelters, or "lead stacks," as they were called, the evidence of which remains in the huge "slag" piles at several points in the district.

There can be no doubt but that these properties will again be put in productive condition, and that conditions favor as rich or richer bodies of mineral below the 1000 level, as formerly existed in the upper levels, and that the upper levels at the present time contain large bodies of low-grade ores. I. H. Rogers, of Eureka, is general superintendent of the Richmond-Eureka.

Next in point of importance is the Diamond mine, 3 miles south of Eureka, with some 40 miles of underground work, hoisting plants and equipment, both on the surface and in the various tunnel levels, and which has produced about \$4,000,000, most of which was shipped to the Salt Lake smelters. The property is

at present idle. The greatest depth in the Diamond is between the 700 and 800 levels. The property embraces a large area of patented ground. There are conditions at the Diamond that should make this one of the big properties of the district.

One of the late developments in the Eureka district has been the bonding of several well-known groups in and near the California and in California gulch, by a group of New Yorkers headed by Major Catlin, who is on the ground in charge of development. Machinery for complete hoisting plant has been purchased. The Old Dunderberg mine, the New Dunderberg, the Uncle Sam, and others, have all been segregated under Catlin's management. Ore bodies

reaching the 100 level, the ore is hoisted and shipped as broken in the mine, and these shipments are now running about \$65 per ton in carload lots. It is stated more than 50% of the purchase price has been paid in royalties since shipments were started, and there is no doubt they have opened a body of ore that will make huge profits. Some of the better grades will run up to \$200. A new hoist and engine equipment is being installed and new development planned.

Immediately adjoining is the Murphy lease on the Helen Mortimer claim. Here are two sets of lessees. Both are taking out shipping ore of practically the same character and grade.

Above the Mortimer is the property of the Hueb-

THE DIAMOND PROPERTY.

SUMMIT SOUTH OF DIAMOND PROPERTY.

ADAMS HILL, LOOKING SOUTH—ORIENTAL AND BELMONT MINES.

ADAMS HILL, LOOKING NORTH—HOLLY MINE IN DISTANCE.

are being opened up, new ground developed by shaft and tunnel, and ore is now being shipped by leasers from this group.

Within 100 yds. of the proposed shaft house and head frame of the Catlin property, leasers are shipping high-grade ore from the California property now under bond and lease to Rebellette & Kelly. Since taking hold of the property a little over a year ago, they have steadily worked the property, sinking and drifting on a body of low-grade ore, or iron capping, and have run a tunnel in about 50 ft., sinking 50 ft. where shipping grade ore was encountered. Since striking the ore about 20 carloads have been shipped, which ran well over \$50 per ton. At first the ore had to be sorted, but at present, and in fact ever since

ner Bros., now under bond to D. States, formerly of Salt Lake. The Huebners and A. Affranchino have been shipping from this property at intervals for more than a year, and have developed several faces of shipping grade of ore in four or five different drifts and raises. Running through the last three properties mentioned is a strong outcrop of rhyolite, with a strike a little west of north and east of south, that also appears on the Uncle Sam property, and is reported on the Hamburg mine to the southeast and at the Windfall mine, a mile farther southeast. Ore has been found in the contact and making in the line in the California and Mortimer, and it is expected this contact will be cut in the Huebner claims in the lower development tunnel that is proposed. Fine

faces of shipping grade ore have been exposed in development of the Huebner claims. The illustration shows ore sacked for shipment at the mouth of tunnel and at the side of the road about 300 ft. distant. On this property there is an east and west fissure and north and south "break" or fracture showing mineral of good grade, all in the lime. There is a strong outcrop of rhyolite running parallel with and cutting through a portion of this property. The tunnel is now in 150 ft. The property lays between the California on the north, and the Diamond on the south, and was acquired early in 1915. A tunnel started on a heavy iron outcrop developed \$12 ore near the surface. Sufficient ore has been shipped to pay for all development and leave a good surplus for equipment.

The Silverado District.

The Summit Queen Mining Co. is planning extensive development work. This company, recently organized by Charles L. Broy, C. Johnson and associates, acquired the Queen and Result properties. This company also owns a group of claims known as the Summit, between the Diamond and Geddes and Bertrand, in the Secret canyon section, where a good grade of lead ore is sacked for shipment. The south 2000-ft. drift in the Diamond approaches the northerly line of the Summit. In this south drift a body of ore was developed and shipped said to have exceeded 18,000 tons of \$80 average grade. The Summit will be developed by both shaft and tunnel.

The Summit Queen Co. also controlled the Oriental and Belmont claims on Adams hill. Leasers are sacking and shipping ore from the Belmont. Much development has been done on both the Oriental and Belmont and a great deal of silver-lead ore shipped. In the early days the Belmont shipped quantities of lead-silver ore, but little depth was attained. At the Holly and Bullwhacker, at the northerly portion of the Adams hill region, large bodies of ore have been developed in the lime and, at or near the porphyry contact, and a great deal of high-grade ore shipped.

At the Marne group on Adams hill, Harris and Fine have developed bodies of shipping ore during the past several months. There are numerous workings on this property, some of which are connected underground, but the deepest shaft is only about 100 ft. It has been the practice of leasers on various properties (still being carried out in places), that when the ore bodies showed signs of depletion, to start work at some other point and fill up the older workings with waste from the newer workings, and there is no doubt that many workings on Adams hill would show good ore at the present time if the older workings were cleaned out. There has also been much caving of the older work. Harris and Fine are developing a very promising property, and are making shipments to more than compensate for the expense and labor involved.

Alex. Fraser, with his associates, has under de-

velopment the Wild West property, adjoining the Cyanide mine on the southwest, the property between the Wild West and the Marne on Adams hill. A large amount of ore has been shipped from the Wild West, and at present a drift is being run from the lower level to get under a big outcrop on the surface upon which a tunnel was driven in early days and much ore extracted. This drift will reach a point where the ore is expected in the next 50 ft.

The Cyanide property is equipped with hoisting plant and has an incline down 300 ft., with various levels and drifts, and gold-silver ore of good grade is being extracted.

Owing to limited space, a description of the Holly, the Bullwhacker, the Windfall, the Geddes and Bertrand, the Hamburg and others is omitted.

A. Affranchino & Sons, of Eureka, owners of the Pack Saddle group, are shipping \$40 lead-silver ore from the Lucia Tuffa, located in the mineral-bearing lime belt between the Hamburg and the Old Dunderberg mines, $3\frac{1}{2}$ miles southeast of Eureka, and on similar formations to the Richmond-Eureka. A strong fissure is being followed in the Lucia Tuffa and Pack Saddle southeasterly and northwesterly, and is mineralized throughout, so far as developed. Cross fractures occur leading off from this fissure to the shale, at intervals of from 50 to 150 ft. Along these cross fractures and in contact with the fissure the ores make and in contact with the lime and shale. In the contact the ores are heavily oxidized and occur in quartz and iron. Values run about \$7 gold, 1 oz. silver, 30% iron with some lead.

The Extension, adjoining the California, is owned by M. Murphy, and Ban Repetto and Alf. G. Repetto have shipping grade of ore. The property is developed by tunnel, shaft and drifts, the shaft being in the tunnel about 200 ft. Shipments averaging \$45 per ton, and a carload per month are reported.

The Silver group, comprising claims 1, 2 and 3, on Adams hill, is owned by Ban Repetto and associates, and have a big iron outcrop, showing values, and is considered a very promising property.

M. Murphy and Phil Paroni have a property adjoining the Silver group on Adams hill, showing considerable development in varying grades of ore carrying lead, silver and some gold values.

Business and mining men of the Eureka mining district have organized a mining bureau for the dissemination of information of reliable and authentic nature covering mining operations in this section. The Eureka Mining Bureau is composed of the leading operators of the district and every attention will be given inquirers desiring information.

The occurrence of mica deposits in many countries insures future supplies of mica for the world for years to come, and the numerous undeveloped mica deposits of the United States may be considered among these resources.

The Atmospheric Problem in the Deepest Mines

G. CHAMBERS.*

The mines spoken of, the deepest working mines in the world, are in Brazil. The problem of reaching depths considerably greater involves mainly the question of human endurance. The system of distribution of the air is becoming, as greater depth is attained, defective and requires modification. On rare occasions the downcast air at the bottom of the mine is comparatively low in moisture, by the time it has passed over two horizons. Consequently the efficiency of the men on the stopes above is considerably impaired; in fact, 86° wet bulb (which represents the conditions of, say, horizon 16, at any rate during the rainy season) is supposed to be the limit at which men can work with full efficiency, and as the mine deepens this will, of course, be more seriously felt. But by largely increasing the volume of air passing through the deepest explorations, and by leading the allotted quantity (after it has passed over the stopes of one horizon, or at the outside two) directly to the upcast and away to the surface, instead of passing it over the stopes above as in the old and existing system, the best possible conditions will be obtained.

Due to the fact of our now being in a much better position as regards the mainway into depth, namely, of its being in advance of the explorations, Captain Watts has proved that it is possible to work each block by one vertical winze only, and our calculations show that this one winze and a steel pipe of 3 to 4 ft. in diameter will, with the eastern paved airway, give ample ventilation to the stopes during the working out of a block of mineral. Consequently, one winze for mineral and filling to act as a temporary upcast, which during the working out of each block disappears as the mineral is removed, is sufficient for the mining operations, and by sinking another vertical winze from one horizon to the other, never less than 50 ft. from the average line of the north wall of the lode, and some connecting tunneling, a permanent return airway will be formed at a cost no greater than that of the old system working out each block with two vertical winzes and a western wood-block airway and the eastern paved airway, as the large saving in the temporary western airway in the form of a 3 to 4 ft. steel pipe over the wood-block airway formerly used is more than sufficient to pay for the tunneling between the top of one permanent upcast winze and the bottom of the next, and that connecting the temporary winze with the permanent. There is another advantage in this system—namely, that when it is completely established we have a second permanent way into depth from horizon 17 down.

It was difficult to determine the point at which

the improved system should commence, but for various reasons No. 23 winze offers the best opportunity for an independent upcast airway, and consequently it has been decided that the new system should commence from this point.

The benefit of the proposed alteration in the ventilating system will not be felt on the blocks of mineral to be worked out from horizon 17 up, but from 17 down. Those of us who have been responsible for the reopening of this mine from surface to its present depth of 5826 ft. have had the opportunity of realizing the steady rise in temperature as the depth has increased and have been frequently reminded of the difficulties in store for us, especially at such times when an inadequate volume of ventilating air had been passing over the stopes or through explorations, caused by the partial closing of airways, the failure of fans, or by the explorations progressing more rapidly into depth than the main ventilating system. However, for many years it was possible to keep down to a reasonable figure the temperature to which the miners were subjected, and it appeared that by increasing the volume this condition could be maintained.

In the first place, natural ventilation was sufficient, later, furnaces had to be adopted during the hot season to assist the natural ventilation. As the mine became still deeper a Capel fan was installed at the top of the upcast "C" shaft to ensure a more constant volume of air. Finally, a Sirocco fan of large capacity was installed in place of the former, the output of which could be increased by additional power when required. Besides this, auxiliary fans are used on all explorations beyond the main system.

The existing ventilating system, which is referred to above as not satisfactory at the present depth, was forced upon us at a time when a more elaborate one of an entire independent airway from surface down, which naturally recommended itself, would have been too expensive. The former represented the cheapest means of ventilation, and until quite recently met the case satisfactorily. As depth has been attained the necessity for modification in the distribution of the air becomes imperative. The lode has so far shown no signs of failure in size or value in the lowest explorations. The prospects of this company being able to work it profitably to a great depth seem only to be limited by cost of winding, hauling, handling, mineral and other engineering matters.

It was decided some years back to institute investigations with the object of obtaining information as to the increasing air and rock temperatures and add to cost the deeper the mine is sunk. Bore holes were made, and the temperatures taken.

From the temperature readings we were able to

*Superintendent of Morro Velho Mine of the St. John del Rey Mining Co.; excerpts from report.

construct a rock temperature grade as a guide to what we might expect in depth.

As before stated, without this rise in temperature from the rock and other causes, the probable running engineering expenses in working the mine down would not mean a very serious increase, and this has proved itself in practice as far as we have gone. Supposing the lode continues the same in size and value to horizon 20 (a vertical depth of 7626 ft.) it could be worked profitably to that point and even a much greater depth, but from the grade on our temperature chart the rock at horizon 26 would be no less than 126.5° F. at the moment of opening.

We have, of late, realized from practice that the best we can now expect in the absence of artificial cooling would be a point where the efficiency of the men would be affected.

The temperature of the rock that had been laid open and exposed to the ventilation for some time year by year fell to some extent, but the deeper we went the cooling effect of the ventilating air would become less efficient, as we were year by year largely increasing the rock area; but beyond certain reasonable limits we could not increase the volume of the air, and consequently, unless the air could be artificially cooled on surface, advantage being taken of the operation to deprive it of some of its moisture, the possibility of working the mine to horizon 26 would be small, unless the working hours were reduced by the introduction of four shifts in the place of three. It was decided to make further efforts in obtaining more reliable information as regards this important question so as to arrive at the most economical and efficient means of reducing both the temperature and moisture of the atmosphere within the mine.

The increase of air temperature, due to the air becoming more dense as it passes down the mine, showed under normal conditions an increase in rock temperature of approximately 1° F. for every 180 ft., while the increase in rock temperature is approximately 1° F. for every 125 ft.

During the cold season an experiment was tried by night, when the temperature was considerably below the normal, in which a known volume of air was passed through a measured distance of the adit tunnel into the mine, the rock temperatures being taken throughout the distance of the tunnel and period of trial, and at the end of 5 hours it was interesting to find that a considerable fall in the rock temperature had taken place, and it would no doubt have continued to do so to some extent had it been possible to maintain a supply of cool air, but as the sun rose the air became warmer and the rock rose again to its original temperature.

The drying of the air has always been considered necessary in conjunction with the cooling operation, but its importance was not so fully understood until information was gained from a valuable paper by Prof. John Cadman. Unfortunately, the drying of the atmosphere is somewhat antagonistic to a satisfactory solution of the dust question, which necessitates watering of the roads and stopes to keep down the dust. However, the proposed distribution of the air, previously referred to, will apparently do far

more to overcome the dust trouble than the drying of the air will make against our efforts in this respect, as the allotted quantity of air, after passing one stope or at the outside two, will go directly with what dust it has taken up, to the upcast and away to the surface, instead of the present system, in which the same air passes the bottom stopes, thence over the remaining stopes, with some slight addition of fresh air at each horizon, but accumulating dust all the way, until it finally reaches the highest stope, and thence goes to surface.

The actual necessities as regards cooling and drying to ensure that as greater depth was attained the miners would work in a perfectly healthy atmosphere (even more so than in the upper sections) having been appreciated, the next point to determine was where the operation of cooling and drying should take place. Some advice had been offered to the effect that it would be most advantageous underground, and it is true that some benefit would be derived from this; but the increase in mechanical appliances underground represents a serious obstacle to our particular form of mining operations, and, further, on account of our principal cooling agent (water) being found on surface in abundance, while underground there is very little, and that at a high temperature it has been decided that the cooling plant should undoubtedly be installed on surface.

Eric Davies, whose duty it has been to carry out the investigations, has also been entrusted with the designing of a plant which we consider most suitable for the purpose, and careful study has led to the proposing of this plant, not for extreme cooling or drying of the air, but one in which each operation will be performed to the most economical point, at the same time making use of ordinary cooling appliances which in practice have long since proved their reliability in cold storage, dry blast for furnace and other installations, and in consequence it represents a thoroughly practical scheme, which will effectually remove the one serious obstacle against the company being able to work the mine to a great depth. As regards the necessary power for driving the plant, this is not excessive, amounting to approximately 400 h. p., and as to the provision of this power, with that of 200 h. p. for ventilation, and other additions necessary for the working into depth, it has been satisfactorily arranged for.

The mine captain considers the efficiency of the miners is very little affected so far, and the writer is inclined to think that men who have been used to the damp, hot climate of Brazil for some years are probably more capable of working efficiently in 86° wet bulb temperature than men in England accustomed to a damp, cold climate on the surface. Often enough in the hot season here the change from surface to the bottom of the mine is only slight, but the change in England would, of course, be a far more severe trial. Even in the hottest places in the mine the contractors are eager to work 12 hours, and had it not been for our complying with this to some extent we should have lost our men. It is, however, evident that in spite of the apparent possibility that this climate is favorable to the efficiency of men working in hot mines, 8 hours is quite sufficient for steady workers at the present depth.

American Institute Holds Successful Meeting in the Southwest

Members of the American Institute of Mining Engineers indulged in an enjoyable novelty last week when they went to the great mineral southwest to hold their annual session. Starting at New York City on last week Thursday evening the party arrived at Chicago where the Chicago section of the Institute entertained the delegation with an automobile ride over the city's boulevards and through the various parks. After a 2 hours' ride dinner was served in the La Salle hotel. With 60 persons in the party a start was made in the evening for El Paso.

Attached to the special train was the private car of Benjamin B. Thayer, president of the Anaconda Copper Co. and past president of the Institute.

Through the courtesy of Carl Scholz, president of the American Mining Congress, members were given an opportunity to study the geological conditions and mineral resources of the country through which they were passing and its environs by the use of a geological map. At Kansas City, Mo., on Saturday morning, the party was joined by the Missouri delegation.

El Paso was reached on Sunday afternoon and the visitors were met by a reception committee, which had supplied automobiles for an inspection of the city's points of interest. In the afternoon the party was guided through the smelter of the American Smelting & Refining Co. by Karl Eilers. In the evening a typical Mexican dinner was served.

Arriving at Santa Rita Monday, the morning was spent in inspecting the pits of the Chino Copper Co. Following this visit the party was taken in automobiles to the mills of the Empire Zinc Co., which demonstrated new magnetic processes to the visitors. A 10-mile auto trip through a section of the valley now being opened by prospectors completed the morning's program.

Upon arrival at Hurley, 2 hours were spent in a study of the methods of the Chino Copper Co.'s mill.

Tuesday was spent in Douglas and the smelting plants of the Calumet & Arizona Mining Co. and the Copper Queen Con. Mining Co. were inspected. The first of the technical sessions of the convention were held here on the general subjects of "Smelting" and "Leaching." Before the opening of these sessions the several hundred attending members visited the reduction works of Copper Queen Con. Mining Co. and of the Calumet & Arizona Mining Co.

A. G. McGregor, of Warren, Ariz., in an address on the "New Copper Smelting Plants in Arizona," told the engineers that in Arizona during the past 5 years there has been more activity in copper-smelting plant construction than in the same length of time in the history of the world. Mr. McGregor said that

in this period five new copper-smelting plants had been constructed and put into operation. The monthly output from these plants, he said, averages from 5,000,000 to 18,000,000 lbs. He then described new problems which had been met successfully and new features in plant design and equipment which had been developed.

At the evening session on "Leaching," Frederick Laist and Harold W. Aldrich described the 2000-ton leaching plant at Anaconda, Mont. A paper on "Possibilities in the Wet Treatment of Copper Concentrates" was read by Lawrence Addicks, and "Leaching Tests at New Cornelia" were discussed by H. W. Morse and H. A. Tobelmam. In the course of the day's proceedings John C. Greenway welcomed the members to Arizona and L. D. Ricketts, president of the Institute, responded for the delegates.

A further handicapping of the chemical industries and the paint and dye manufacturing interests of the country, due to a lack of manganese ores, was predicted at the Bisbee meeting on Wednesday. This statement was contained in a paper by E. C. Harder of the U. S. Geological Survey, presented to the Institute members for discussion.

Mr. Harder's treatise explained that even at the beginning of the European war there had been a great decrease in imports of both ores and alloys of manganese and that since 1914 the price had risen from \$37 per ton to \$100 per ton with ferromanganese selling considerably higher.

Another feature of the session was the statement in a paper by David B. Reger, of the West Virginia Geological Survey, to the effect that "the exhaustion of oil and gas in the United States is proceeding at a rapid pace." Mr. Reger predicted that this problem will first be partially solved by securing of deeper producing horizons in the high-grade oil regions and later by the possibility of mining deep sand oil and gas.

Other papers attracting considerable attention of the delegates were: "The Geology of the Warren Mining District," by Y. Bontillas, J. B. Tenney and Leon Feuchere; "Co-operative Effort in Mining," by Joseph P. Hodgson, and "Gold and Silver Deposits in North and South America," by Waldemar Lindgren.

In this last paper Dr. Lindgren stated the conclusion that the South American mineral resources in precious metals are less than those of the northern continent and that "even progress and enterprise will be unable to raise its production to approach the figures attained by North America."

Possible means of developing the flotation process to the greater benefit of the country's mining inter-

tests were taken up in the sessions held at Globe. Conclusions reached by the delegates, who include representatives of 20 of the leading metal producing companies of the country, were to the effect that the flotation process is now in its infancy and that with the further discovery of new flotative agents and generous expenditures a brilliant future record could be obtained for this process.

During a part of the day the visitors descended many hundred feet into the mines of Old Dominion Copper Co. and later visited the reduction works of this company. During the evening technical sessions were held on the subject of "Fine Grinding" in which F. C. Blickensderfer of the Detroit Copper Mining Co. described a comparative test of the Marathon, Chilian and Hardinge mills.

Flotation discussions were particularly important to mining interests because of the first public presentation of a report of experiments on several miscellaneous wood oils which seem adaptable to use in the flotation process. A statement of some of the values of these oils was presented by R. C. Palmer of Madison, Wis., Glenn L. Allen, of the Shattuck Arizona Copper Co., and O. C. Ralston, of the U. S. Bureau of Mines.

Another especially striking feature of this discussion was a description by Dr. Rudolf Gahl, representing the Inspiration Con. Copper Co., of the exhaustive research and experiment of his company in an effort to develop the flotation process. Said Dr. Gahl, "The flotation process is in its infancy. In what direction future changes may take place is perhaps indicated by tests which have been made partly on a laboratory scale and partly on a somewhat larger scale. The fact that the Inspiration Co. has been able to design a commercially successful flotation plant must be attributed to the policy of spending great sums of money for the purpose of investigating the flotation process on a commercial scale."

A serious gasoline shortage on the Pacific Coast, the effect of which would extend throughout the entire country during the next year, was predicted at the Globe session. W. R. Hamilton of San Francisco presented the gasoline industry data to the engineers. According to Mr. Hamilton the only possible means of increasing gasoline production is by increased production of either light oil or casing-head gasoline, lowering the grade of market gasoline, or by successful innovations in refining methods. Most of these solutions Mr. Hamilton explained as impracticable in the immediate future, although stating that by lowering the grade production could be increased 30 to 50%. He attributed the future gasoline shortage to decreased production of refinable oil (the decrease amounting to 6,000,000 bbls. in 1915), steadily increasing consumption, the discontinuance of imports and the heavy exports due to the war demands.

During the course of the meeting at Globe the mining engineers heard the value of chemistry to the

coal mining industry in a paper by Edwin M. Chance. Mr. Chance's conclusions showed that Americans have in the past been purchasing coal on its looks rather than because of its heating power. He made public results of experiments which showed dull appearing coal to have better heating and burning properties than the bright coals which have formerly demanded premiums in the market. It is said that this discovery will greatly help to offset the cost of coal production without materially increasing the costs to the consumer.

On Friday visits were made to the reduction works of the International Smelting & Refining Co., the Inspiration and the Miami companies.

On Saturday a trip by automobile was made over the Apache trail, and a visit to the Roosevelt dam. Dinner was served at Phoenix.

Leaving Phoenix Saturday night the party reached the Grand Canyon early Sunday morning where the day was spent, and from which point the visitors departed for their homes.

Leading metal producing companies from all sections of the country were represented by members of their staff at the meetings. The country's record production of metal during the past year has greatly stimulated the interest in those general mining topics which were discussed at the Institute's sessions.

Some seventy papers were prepared for discussion, bearing largely upon new methods of production and the mining outlook in various parts of the world. Some of the most important of these are:

Automatic Operation of Mine Hoists as Exemplified by the New Electric Hoists for the Inspiration Copper Co. By H. Kenyon Burch and M. A. Whiting.

The Water Problem at the Old Dominion Mine. By P. G. Beckett.

Power Plant of Burro Mountain Copper Co. By Charles Legrand.

Geology of the Warren Mining District. By Y. Bonillas, J. B. Tenney and Leon Feuchere.

Flotation Concentrate at Anaconda, Mont. By Frederick Laist and Albert E. Wiggin.

History of the Flotation Process at Inspiration. By Rudolf Gahl.

The Advent of Flotation in the Clifton-Morenci District, Arizona, 1914-15. By David Cole.

Comparative Test of the Marathon, Chilian and Hardinge Mills. By F. G. Blickensderfer.

The Inspiration Plant, Concentrator and Other Surface Equipment. By H. Kenyon Burch.

The Buffalo Mines, Ltd., at Cobalt, Ontario, will put in operation a 600-ton flotation plant within a few weeks. It is being constructed to treat 150 tons of concentrates and 450 tons per day from the tailings piles. The tailings will be conveyed by belt, loaded by a 12-ton locomotive crane, with 1-yd. clam shell bucket. Grinding will be done by four long tube mills in closed circuit with Dorr classifiers. Callow pneumatic flotation machines will be used, consisting of four 2-compartment, treble length, rougher cells and four 2-compartment cleaner cells. Each rougher cell in conjunction with one cleaner cell will have a capacity of 150 tons per 24 hours.

Making Mine Engineering Calculations

The mine engineer or contractor, as a rule, is alive to and keenly interested in time and labor saving methods and devices which have to do with operation and construction. Show him a machine or a system of operation that will enable him to do more and better work on a job with less effort and expense and you will always find him attentive and receptive.

But with respect to the office end of his work, he is not always so progressive. His methods of accounting are too often crude and insufficient. The accounting and estimating departments are commonly regarded as an overhead expense—necessary of course,

mind does not work that way. It is not a machine and cannot therefore be depended upon for mechanical accuracy. The assembling of figures in any form—addition, multiplication, division, subtraction—is purely a mechanical process. This is true, not only in a theoretical sense, but in a very practical sense. The proof of it is found in the extensive use made these days of adding and calculating machines in all the problems of accounting, including the calculations of engineering and contracting.

An ore stripping contractor not long ago, was surprised to find that he had lost money on a contract

A COMPTOMETER DESK IN MINE ENGINEER'S OFFICE—MAKING PLAN AND ESTIMATE CALCULATIONS.

but incapable of being converted into a constructive force for increasing profits.

Naturally there is a desire to reduce this expense as far as possible—an end desirable in itself, but economic only when achieved without loss of efficiency. If the same logic were applied in the solution of this problem as is habitually employed in the reduction of expense of development in construction work, much economy would result. But the trouble is that while the advantages of mechanical appliances for multiplying the product of manual labor are fully recognized, the idea of handling figures by machinery has been much slower of adoption. Usually the mine accounting office is about the last place to receive attention when improved methods are being considered.

Whether a property shows a profit or loss often depends upon the care and exactness with which the operating cost estimates are prepared. A mistake of calculation may prove disastrous. Accurate figure work is therefore of the utmost importance. A machine always does the same thing in exactly the same way. That's what "machine precision" means. The

which should have yielded a fair profit. The job was put through without a hitch according to plan. The estimates had all been carefully figured and checked in the usual pencil and paper way, and it did not seem possible that a serious error could have been overlooked. Nevertheless on the suggestion of a friend, the figures were gone over again, this time with a machine. It was then discovered that, besides several minor errors, that a mistake in extension of over \$2000 had escaped.

To err is human, but to provide the best safeguard against error is the part of business prudence.

The figuring of costs on engineering work and mine or mill operation requires a large amount of clerical detail; yet without a clear analysis of the cost of material, labor, operating and overhead expense, the price must be more or less guess work. Costs of contracting work can only be obtained by the keeping of careful records of all operations. The more complete the distribution in the recording of expenditures, the easier it is to analyze the cost of each element of construction. It is obviously of great advantage to

the contractor to be able to go over a completed piece of work and with the figures before him, see just what was spent in materials and labor on each part of the job. By this means, he is able to observe mistakes of judgment, mismanagement, or faulty estimates and so forestall their repetition in the future. Every contractor, big and little, knows the value of such information.

Why, then, are they not more interested in securing it?

The answer is, "It costs too much—can't afford to spend any more money on clerical work." This objection is valid only when based upon the old and laborious method of mental calculation. Where the machine idea for handling figures has been adopted in contracting offices, it has been found that the scope of the accounting department has been largely expanded without increasing the expense. This is made possible by the greater speed with which all calculations are handled on the machine.

In a certain engineering office the estimates were formerly figured by two expert mental calculators who found it difficult to keep up their work. One young man with a machine is now doing all this work with time to spare. Like results were obtained in another office on figuring payroll.

Time is often an important factor with an engineer when an estimate has to be prepared in a hurry. There is a big chance for error at such a time. Good contracts have been lost simply because the office force could not make up the figures in time, when it would have been an easy matter to have figured and checked the whole estimate with a machine in the time required.

The average engineer or contractor does not need or want an elaborate or cumbersome system. The system he has developed is usually best suited for his particular needs. What concerns him most is the means for handling the work involved most expeditiously. He can't go wrong if he applies the same principle to the office that makes a success of his outside work: Let machines do the machine work.

Electrolytic Extraction of Copper.

Cheap precipitation of copper, with simultaneous regeneration of the acid in amount sufficient for a cyclic process, are features embodied in an apparatus devised by William E. Greenwalt, Denver, Colo. At the same time the system overcomes the difficulty of foul solution usually in such electrolytic processes. Explanation of the accompanying diagram will make clear the essential features of the idea, upon which he has received patent.

In the vat (1), the ore is treated with an acid solution and leached. The copper, mostly in the form of cupric chloride, is then filtered from the gangue and passed into a reducing tower (2), to be treated with sulphur dioxide, the copper, iron and other salts being

reduced to their lowest valency. Next, the cupric acid, also containing considerable free acid, passes into a storage tank from which it is delivered in a continuous stream to precipitating tower (5), where it is precipitated with hydrogen sulphide. The precipitate is next allowed to settle in tank (7). The regenerated acid solution is then filtered in filter press (10), the clear liquid being stored in tank (11). From here it may be pumped into tank (15).

This regenerated solution contains all its salts at lowest valency but contains also some hydrogen sulphide. To make it more effective it is oxidized in tower (16). If there is gold in the ore, or if free chlorine is desired in the solution to act on silver in the ore,

METHOD FOR ELECTROLYTIC EXTRACTION OF COPPER.

the chlorine is produced from a salt solution by the electrolyzer (17).

The precipitate in tank (7) is now washed and filtered and treated in electrolyzer (18). The insoluble anode is a lead sheet covering the entire bottom of the tank, and on this the precipitate is placed.

The cathode consists of thick sheets of copper (22) suspended in the solution above the anode, a diaphragm being placed between the two. By oscillating the diaphragm, sufficient agitation is obtained to remove the sulphur in the solution.

Zinc dust oxidizes rapidly, absorbs hydrogen and is chemically very active, resulting at times in spontaneous combustion or explosion.

Chicago Meeting American Mining Congress

The American Mining Congress at its nineteenth annual session which opens in Hotel La Salle, Chicago, Nov. 13, will endeavor to definitely formulate the long-sought-for and long-fought-for revision of the mining laws of the country.

Dr. Foster of Illinois, chairman of the House Committee on Mines and Mining, will be in attendance and will report on the actual progress made on this subject by Congress giving the objections raised to many of the contemplated changes, and his ideas as to what can be passed through both houses of Congress.

The first appeal made by the American Mining Congress for a Bureau of Mines was backed by less than one-twelfth of the members of the House of Representatives. But on May 16, 1910, the bill was signed by the President, and on Feb. 25, 1913, an amended bill was signed covering more particularly the western situation.

Since that time the efforts of the American Mining Congress have been directed in part to securing adequate appropriations for the work of the Bureau. And this struggle has been no easy one, but on the whole extremely satisfactory.

One of the great works of the American Mining Congress is, however, along the lines of planning legislation which provides greater safety for the lives of the men engaged in coal and metal mining operations. The results of the legislation initiated by the American Mining Congress has reduced by nearly one-half the number of men killed per million tons of coal produced. Acting on the humanitarian impulse created by this movement of the American Mining Congress the big organizations of the country have almost without an exception introduced the splendid "Safety First" efforts which have been so productive of good results everywhere.

The American Mining Congress has secured the adoption of laws by many states east and west making misrepresentation of mining stocks a misdemeanor.

It has prepared comprehensive laws for the use of electricity in mines. That which applies to coal mining operations has been adopted as a whole by Pennsylvania and has been considered by other states. Its model law for the creation of mine drainage districts, its work for substantial aids to state mining schools, its protests against federal interference with water power, its comprehensive investigation of mine taxation, are but a few of the many laws which it has so successfully espoused.

The American Mining Congress at the coming session plans to devote considerable attention to the oil industry. The general meetings are to be held in the mornings, and the sections devoted to oil, coal, lead and zinc, copper and precious metals, are to meet every afternoon in their own assembly rooms at the hotel. One of the special questions in the oil

section will be that relating to the rights of the western oil claimants upon lands withdrawn from entry and upon which large development has been made.

But there will also unquestionably be an emphatic protest against policies of the government in the proposed creation of naval oil reserves, and more particularly against the policies which work gross injustice to oil claimants who located their claims and carried on development work under the provisions of then existing legislative conditions.

The government is sending its greatest experts to this convention. There is also the hope that both Secretary of the Interior Lane and Secretary of Labor Wilson will be present and take part in the important discussions. Van H. Manning, Director of the U. S. Bureau of Mines, will deliver an address on "The Past and the Future of Mine Safety Work." This will emphasize the tremendous advance already made through the efforts of the congress and the bureau in the way of safety methods, and outline the greater needs of the future.

W. S. Gifford, Executive Director of the U. S. Commission on Industrial Preparedness, will deliver what promises to be a notable address on "Efficiency in the Handling of Productive Forces." Chairman E. T. Hurley, of the Federal Trade Commission, will speak on "The Work of the Commission and the Mining Industry."

In all of the "sectional" meetings the experts will be present to advise. Dr. F. G. Cottrell's address on "The New Things in Science" will be one of the most comprehensive résumés ever given of the accomplishments of the past few years. C. E. Siebenthal, of the U. S. Geological Survey, is also one of the government experts who has promised to attend.

Dorsey A. Lyon, oil flotation expert, will talk on that topic.

The programs for the general meetings and those for the "sectional" gatherings under "Zinc and Lead," "Precious Metals," "Coal" and "Oil" have now been supplemented by three meetings of "Copper" men.

An assembly hall in Hotel La Salle has been set apart for this section, and its first meeting will take place Tuesday, Nov. 14, at 2 p. m. This will be presided over by Hon. Wm. A. Clark. The principal addresses for the first session will be on "The Copper Resources of the United States," by Walter Harvey Weed, of New York; "The Future of Copper," by Thomas F. Cole, of Duluth, Minn., and one on the "Relation of American Copper Supply to Industrial Development," by a speaker of prominence in this industry.

On Wednesday afternoon in this section the address on "Copper in Its Relation to Preparedness" will be by C. F. Kelley. R. C. Gemmill, of Salt Lake City, is to have an address on the question,

"Should the Export of Copper at Production Cost Prices Be Discouraged?"

Another address of the day will be on "Copper in Its Relation to Industrial Efficiency."

On Thursday in this section, Dr. L. D. Ricketts will preside. The principal address of the day will be on the question, "Should Combinations Be Fostered to Command for Export of Copper a Price Commensurate with Its Actual Value in Commercial Development?" Every effort is being made to have John D. Ryan, of New York, talk on this topic. Another address of the day by an expert is on the subject, "Relation of the Federal Government to Copper Export."

Safe Insulation is Important.

From an industrial safety standpoint few factors are of more importance than correct insulation. As early as 1875 the Dickinson Mfg. Co., Springfield, Mass., and ever since, has made thorough researches to discover insulations best adapted to special uses, having in view quality and safety.

Following are a few of the compositions which have been evolved and which are capable of the widest application, and there is hardly an industry that cannot make profitable application of one or more of them.

Stern-Condensite is one of the latest developments in the field of moulded insulation. The raw Condensite is produced by a reaction between phenol and formaldehyde. This is the first phenolic condensation product made free from water or the impurities incident to manufacture.

Condensite is a high-grade plastic which can be readily moulded in its uncured state into an infinite variety of shapes, with or without metal inserts. It leaves the molds, cured under heat and pressure, presenting a polished, hard rubber appearance, however much stronger mechanically. It possesses high dielectric resistance, withstands most acids, except nitric, sulphuric and strong hydro-fluoric. Climatic conditions do not affect it, and withstands heat up to 350° F. without softening.

Sternoid, the invention of Kurt R. Sternberg, manager of the company, is designed to meet the demands for rough usage and service, and withstands temperature of 500° F. Like Stern-Condensite, it is very strong mechanically, and can be moulded into a variety of shapes containing metal inserts.

The company uses a number of other compounds for various uses. All these products are capable of an infinite variety of uses for the electrical trade and many others.

The main function of slags is to separate gangue stuff or impurities from metals, and to protect them from injurious action of gases or other substances while they are heated to high temperatures. Being poor conductors, they conserve heat by retarding radiation from the body of metal they cover.

Saving the Values in Flue Dust.

Flue dust from the reduction furnace contains a considerable percentage of metal ordinarily considered as waste product. A method of saving this waste by means of a simple apparatus is described in a patent recently issued to Samuel L. Boggs, Pittsburgh, Pa. Not only flue dust but any other fines which have been stored may be treated in this way. The principle of operation is quite simple, making use as it does of the molten metal incident to reduction in the main furnace, coupled with a blast of gas generated in the same furnace.

The flue dust or fines is mixed with the molten metal as it comes from the furnace. A considerable percentage of the metal in the dust will be reduced immediately. Some, however, will not be reduced in this way and will float on the surface in the form of a matte. It is to this matte that the gas blast is ap-

METHOD OF SAVING VALUES IN FLUE DUST.

plied, completing the reduction. This gas, carbon monoxide, in addition to its great heating powers, has other properties making it peculiarly effective in the reduction.

The illustration indicates the simplicity of the apparatus required. From the top of the blast furnace, the dust falls through a slanting pipe to a collector box having an ordinary outlet valve at the bottom. The molten metal is drawn from the furnace by a spout into an inclined trough or runner leading to the ladle car.

The dust is mixed with the molten metal in the trough where a large proportion is reduced. That which is not reduced forms a matte on the surface in the ladle car. To apply the gas to this matte and complete the reduction, a peculiar bell-shaped hood is arranged so that it can be lowered over the surface. Gas is piped into this hood from the furnace, being ejected downward, as shown in the detail drawing, with sufficient force to agitate the surface and quicken the reduction process.

Lead melts at 327° C. and boils at about 1500° C.

Operations in the Tintic District, Utah

W. A. SCOTT.

Chief Con. Mining Co., Eureka, Utah, of which W. Fitch is president and general manager, gives some interesting data concerning operations for the first 6 months of 1916. In development work there were 9091 ft. of drifting and 600 ft. of raising. Ore shipments amounted to 42,144 tons, yielding \$742,057, after freight, sampling and smelting charges were paid. The metallic contents of these ores were as follows: Gold, 5225 ozs.; silver, 843,535 ozs.; lead, 8,450,932 lbs.; zinc, 519,798 lbs.; copper, 1795 lbs. The assay values were: Gold, 0.124 oz. per ton; silver, 20.02 ozs.; lead, 11.79%; zinc, 30.36%; copper, 1.95%. This gave a gross value of \$30.08 per ton and a net value of \$17.61 after deducting transportation, sampling and smelting charges.

Cecil Fitch, superintendent, reports that a considerable portion of ore now being produced is taken from the flat deposits between the 600 and 800 levels, and that stoping progresses on 600, 1000, 1200 and 1400 levels. A body of zinc ore of good grade was lately exposed on the 1000 level. The ore system between the 1550 and 1800 levels has been developed northward to a considerable extent, where new ore bodies have been opened at the 1800 level, and has been partly proved up to the 1600. It has also been followed to water level at 1820-ft. depth. About one-third of the output is being taken from this part of the mine. A system of development is being carried out on numerous levels, amounting to 2000 ft. per month.

All drifting is being done under contract. Mining in the big stopes, amounting to four-fifths of the mine production, is carried on by company force; the other one-fifth is the result of 3-months leases, of which there are a good many. These are let in 100-ft. squares. The company hoists all waste for leasers, but charges for hoisting ore and for material used. It takes a certain royalty out of the net smelter returns, paying the leaser the balance after deducting charges. These leasing operations result in a systematic clean-up of minor ore bodies throughout the mine.

Geological data concerning the Chief Con. holdings and contiguous territory are constantly being worked up by G. W. Crane, company geologist. By this means the operations have been extended and new groups are being developed. One of these is at Homansville, 2 miles east of Chief mine proper, where the Homansville shaft is being sunk under contract by Walter Fitch, Jr., Inc., organized to do mine development and tunneling. This is a 3-compartment shaft, 6 by 16-ft. outside dimensions, which on Aug. 19 had reached a depth of 335 ft. In this work some new records were made. During 8 consecutive days of 3

shifts an average depth of 9.73 ft. per day was made; and for July an average of 8.26 ft. per day was sunk, amounting to 256 ft. in 31 days. Work was begun on the surface with 3 engineers and 3 topmen. The shaft was lagged from top to bottom as sinking went on, and a staggered ladderway was put in, with a landing at every second set. Three shifts of machine men with muckers worked in the shaft, while one shift a day of 2 timbermen worked above a swinging bulkhead to protect the men at the bottom. This bulkhead was suspended from the set above it by chain blocks, and before putting in a new set of timbers it would be lowered to the proper height above the drill men. While sinking two 15-cu. ft. buckets were used in hoisting. A special dumping device was made use of at the collar of the shaft. Walter Fitch, Jr., manager of this mine contracting company, has numerous contracts in force, sinking and driving. In the shaft work referred to Denver Rock Drill Co.'s clipper drills were used.

Utah Minerals Concentrating Co.

The Utah Minerals Concentrating Co. is operating a custom mill at Eureka in which about 80 tons per day of Tintic district ores are being concentrated. Low-grade, silver-lead ores are obtained from the Eagle & Bluebell dumps, from Bullion-Beck lessees, May Day dumps and other properties. In these ores the lead is mostly a carbonate, and the silver a chloride, there being no zinc. The plant of machinery is electrically operated, and consists of a No. 2 Allis-Chalmers gyratory crusher, 3 sets of rolls, reducing to 5 mesh, the product passing over 7 Isbell tables. A tube mill is included in the equipment for use when finer grinding is required. The tables are adjusted, some of them to operate as roughers and others as finishers. In addition to the concentration of lead-silver ores, this company is milling a considerable tonnage of tungsten ore, the largest shipments being received from the mine of the Byllesby Co., 22 miles from Lovelock, Nev. This consists of scheelite and contains 2 to 1/2% tungsten, present shipments amounting to 600 to 700 tons per month, pending the construction of mill to treat them near Lovelock. The mill at Eureka ships the concentrates to a plant at Denver, where the garnet, which occurs in the lime gangue, is separated from the tungsten product. The company's operations are under the management of Henry M. Adkinson, well known in mining circles in Utah and Colorado. He is assisted by J. H. Hedges.

Tintic Milling Co.

The Tintic Milling Co., Jesse Knight, president; Geo. H. Dern, general manager, and T. P. Holt

metallurgist, has installed reduction works for leaching copper-silver ores in the buildings and on premises formerly occupied by the Knight smelting plant at Silver City. The blowers and some of the other equipment of the old smelter are utilized in the new plant. The crushing facilities have a capacity of 750 tons per day. Three of the Holt-Dern roasters, 30 to 40 tons capacity each, are now in use, and 8 more of like capacity, but of improved design, are being put in position. These roasters are adapted to oxidizing, sulphatizing and chloridizing; but in this plant the ores are given a chloridizing roast, which results in no volatilization of metals. They are blast roasters, all being connected to the blowers. The ore which enters the roasters at minus 8 mesh is mixed with salt and coal dust, the feed opening being at the top. The leaching takes place in wood tanks, the solution being drawn off into compartments where the metals are precipitated on scrap iron. The ore received at this plant comes from the Knight mines, and others in Tintic district, the approximate content of which is 6 ozs. silver, 0.5 to 1% copper and about \$1 gold per ton.

Eagle & Bluebell.

The Eagle & Bluebell Mining Co., manager for which is Imer Pett, Salt Lake, recently installed new equipment at its 1900-ft. shaft, Eureka. This consists of an Ottumwa Iron Works, double-reel electric hoist, good for a depth of 2500 ft., and an Ingersoll-Rand air compressor of 1700 cu. ft. of free air per minute capacity. These are housed in a new steel and concrete building. A new headframe, set upon a solid concrete substructure, is also in evidence. The property formerly was worked through a 1100-ft. interior shaft, the collar of which is on a tunnel level 1300 ft. from the portal. But this is of use only for ventilating purposes since the completion of the new shaft, with two hoisting compartments, trackage from which leads out to shipping bins on a railroad. The mine workings are connected with the new shaft on all main levels; and development is proceeding on the 1000, 1300 and 1700. At the depth of 1875 ft. a station is being cut out, the bottom of the shaft here being in lead-silver ore. The purpose is to resume sinking and go 150 ft. deeper. The cages are operated only to the 1700-ft. station, where a small air hoist is used to run a bucket between that station and the 1875. In this mine the ore occurs in irregular bodies at the intersection of north-south line strata, with cross-fissures. The limestone bedding dips east, the cross-breaks south. The ore shoots stand in all positions, from vertical to horizontal, irregularity being the distinguishing feature. The greater part of the ore is oxidized and carbonates, although there are considerable bodies of sulphides and mixed ore between the 1400 and 1800 levels. There is no line of demarcation between carbonates and sulphides, how-

ever, as considerable amount of carbonate and oxidized ore exists at the 1900-ft. station.

Inasmuch as the ore shipments from Eagle & Bluebell have been curtailed by the smelters, due to a congestion of ore at their plants, a good part of the mine force is on development work. The cages here, when handling men in the shaft, are completely enclosed with steel folding gates or doors as a means of safety. The door sections are readily opened and folded back and fastened to the cage frame when not required to be closed. Similar appliances are in use in mines of Montana. Wm. Owens is mine superintendent.

The Gemini Property.

The Gemini mine, Eureka, superintended by John H. McChrystal, is shipping 2000 tons per month of silver-lead ore, which is the product of about 130 men working under 90-day leases. The ore samples about 15 ozs. silver and 15% lead, mostly oxidized. They also mine and market close to 100 tons per month of zinc ore, which occurs as a shell, or casing, around the lead-silver bodies, and runs 25%. The company has a force on development work driving northeast and east on the 1500 level to cut the Ridge & Valley ore bodies lying to the north. The Ridge & Valley is operated through the Gemini, and the Eureka Mines Co. holdings of 7 claims are also being developed on the 900 and 1300 levels through Gemini shaft, all these interests being closely allied. The car of ore per week shipped from Ridge & Valley samples 40% lead and 8 ozs. silver. The Godiva, also controlled by McChrystal interests, is producing 8 to 10 cars of ore per month, half lead-silver and half zinc. The zinc ore runs 35 to 40%. The Godiva's zinc ore stopes, between the 400 and 600 levels, are on big bodies of solid ore containing practically no lead. Jackson McChrystal, Salt Lake, is general manager of all these interests.

Oil Flotation Process Improved.

Efficiency of the mixture used in the oil flotation process of concentrating ores is in proportion to the amount of oil required to produce a froth of the necessary amount and consistency to collect all the ore particles. A great many kinds of oil are used, such as coal oil and pine tar, eucalyptus oil, cotton seed oil, etc., but the frothing tendency of all of them can be increased by adding to the oil a certain percentage of resinates of an alkaline metal such as soda, potash or lime. The chemical equivalent of these alkaline metals, ammonia, may also be substituted and combined with rosin to form resinates of ammonia.

That the idea is practicable is evidenced by the fact that the originator, Homer T. Yaryan of Toledo, O., has taken out a patent upon it. He states that, in practice, he was able to obtain a superior flotation oil by mixing together 50% petroleum, 15% pine oil and 35% resinates of soda or resinates of ammonia.

Rotating Ore Classifier.

An original and ingenious idea in the way of an ore classifier has been worked out by William H. Wiegand of Trojan, S. D. It is of the rotary type and is capable of running through a large amount of ore in a short space of time. Four views of the machine are here shown, a plan (Fig. 1) and three ele-

FIG. 1. PLAN.

ventions (Fig. 2) partially in section. Observing first the plan, the ore and water are delivered to a ring shaped trough (19) and fall through holes (20) into the tank below. This tank is conical in form, and arms or sweeps (17) are continuously revolved in it. These arms carry spirally shaped vanes.

As the liquid falls into the tank—slime, water and

FIG. 2. ELEVATION.

ore particles all mixed together—the latter, being the heaviest, settle to the bottom and the vanes on the arms push them outward and upward along the rising bottom, until they are finally discharged, cleanly washed, into the trough (11) at the outer circumference.

The slimes, which float to the surface, are drawn

off through the funnel-shaped outlet (21). The funnel shape is given to the upper part of this member by detachable rings (23) of varying diameters. These rings can be added to or taken from, as it is desired to increase or decrease the level of the liquid in the tank, and therefore to take out finer or coarser slimes as the case might be.

In the operation of this classifier, the ore particles are thoroughly washed and they travel a long distance, being agitated and overturned in a vigorous manner by the moving vanes. Thus a uniformly graded product is obtained, and, at the same time, the machine is said to be capable of handling a surprisingly large quantity on a given time.

American "Ichthyol."

The current publication of the Geological Survey on the production of asphalt and related bitumens in 1915 contains a brief note on the subject of ichthyol. Prior to August, 1914, this asphaltic material, which is employed as an antiseptic medicament, was imported from Europe. It is derived from a bituminous rock, filled with fossil fish, that is found in the Austrian Tyrol. American imports had increased from 24,000 lbs. in 1910 to 60,000 lbs. in 1914, but dropped off last year to less than 25,000 lbs. In view of the inadequacy of the foreign supply to meet the domestic demand under present conditions, it is interesting to know that in this product, as in others, America has come to depend on its own resources. So far as known, there are in the United States no deposits of asphaltic material of the peculiar type from which ichthyol is derived, but American chemists have solved the problem of supplying the domestic needs in this regard, and favorably recommended substitutes for ichthyol, prepared from domestic materials by synthetic methods, are now available in the markets.

The Survey's general report on "Asphalt, Related Bitumens, and Bituminous Rock in 1915" is now ready for distribution. During the year the natural asphalt of all varieties sold at the sources of production in the United States aggregated 75,751 short tons, valued at \$526,490.

Exports of Grecian Magnesite.—Magnesite shipments from Greece in 1915 are given by U. S. Consul General A. W. Waddell of Athens as follows, in metric tons:

To—	Raw.	Calclned.
England	43,545	7,627
United States	33,641	6,318
France	13,375	4,331
Netherlands	1,750	350
Greece	350	100
Total	92,661	18,726

All Grecian magnesite mines are located in the Athens district, most of them being on the island of Euboea. In 1914 the mines produced 117,430 metric tons of raw magnesite. The total 1915 output is placed at 133,858 tons. The United States bought more heavily in 1915 than formerly.

The Andes Copper Co. to Soon Begin Development.

Actual work of development is soon to be begun on the property of the Andes Copper Mining Co., an Anaconda holding in Chile. This information was advanced by B. B. Thayer, who has been in Chile recently looking over the Potrerillos ore deposits. This is situated about 62 miles in the interior of the Cordillera, from where the railway from Chañaral terminates, and in a region which is absolutely sterile and deserted. When Mr. William Braden visited it for the first time in March, 1913, there were no signs of life and it may be said that the place was virtually abandoned. Some *pirquineros* worked, or rather destroyed, with their own hands, the two or three places in which there appeared veins of metal which might have paid for the cost of transportation down on muleback to Pueblo Hundido. The Potrerillos Mining Co., the former owner, although formed of enthusiastic and intelligent men, was confronted with a very difficult problem. It had no capital, as it had already used up all that which had been paid in by the shareholders, and more, which some banks had advanced on the personal guarantee of the directors. Its mining properties, of lowest grade ore, as it was afterwards verified, was not a paying proposition under the then-conditions of working, and it would have been absolutely necessary to invest large sums in constructing a road, houses and other buildings, apart from solving the technical difficulties in treating the ore. All would have ended in a certain loss. Mr. Braden was interested in studying the property with the ultimate idea of acquiring it, and he saw the possibility that a little exploration might reveal a low-grade ore deposit which would form the basis for an industry of some magnitude. He was able to induce some of the men who are in charge of the Anaconda Mining Co. to take an interest in this work, which was of course somewhat adventurous, and the explorations were begun. They have already lasted 3 years and will have to be continued for some time to come; they have cost the sum of 3,500,000 pesos, which have been spent in explorations, tunnels, roads, houses, and in general, everything necessary to organize and maintain an enterprise in a desert location, having great difficulties to surmount, distances to overcome and the scarcity of supplies to contend with. The result has justified these sacrifices, and has proved Braden's foresight. It has revealed the existence of a great tonnage of ore of between 1½ and 2% copper, which permits the investing of a large capital for its exploitation. For this object the Andes Exploration Co. was successfully organized in New York, and the actual work of development should begin very soon. This company will build the railroad between Pueblo Hundido and the ore deposit, a distance of 62 miles, through the desert; build the hydro-electric power plant, for which it will be necessary to bring the water

from the rivers in the interior by means of canals over 43 miles long and across very difficult ground; and finally it will develop the mines proper. The company intends to begin working with a plant which will permit of a daily capacity 3000 tons of ore and shall go on increasing its capacity as the size of the ore deposit should indicate. Moreover, it will be necessary to construct the port works which are lacking in Chañaral.

According to Mr. Thayer, the company will be inflexible in fighting alcoholism and its vices, but in exchange the workmen will have hygienic habitations, schools, savings banks, etc., and the country will have, in general, always in view, an example of live organization and culture.

Arctic Copper Deposits.

Dr. R. M. Anderson, who recently returned from an inspection of Arctic copper deposits for the Canadian government, gives a brief outline of his discoveries:

"We were instructed to survey the copper deposits already known and seek new ones. Every explorer from the earliest times has noted that the Eskimos east of the Mackenzie used knives, spearheads and other weapons and utensils hammered from copper, and the Coppermine river, which empties into the Arctic, got its name from mineral discoveries many years ago. We found on Coronation gulf and Bathurst inlet vast deposits of copper of low grade. We were not equipped to undertake mining operations, but upon the sides of cliffs we could measure the depth of successive flows of amygdaloidal lava containing nuggets of copper. An Eskimo brought to us a lump of copper weighing 40 pounds. There were seams in the lava that had been filled with pure copper. Our geologist took many samples of rock, which will be assayed. He also made many estimates of the area of ore in sight.

"The ore had many of the characteristics of the Lake Superior copper rock. It is workable from the surface, and is near navigable water. It would be feasible to construct a railroad from the Mackenzie river, which is navigable five months of the year, to Great Bear lake, which also is navigable much of the year. A further railroad line could be built from the lake to the copper fields, enabling the transportation of the ore."

American Smelting & Refining Co.'s exploration work is now carried on through its mining department, of which H. A. Guess, New York, is managing director for that department. Branch offices have been established at El Paso, Tucson, Denver, Spokane and Salt Lake City to handle this work. E. E. Price, resident engineer at Salt Lake, looks after a field embracing Utah, Nevada, Arizona and portions of other states.

What the Mining Companies are Doing

Nevada-Douglas Co., Nevada.

The report of the Nevada-Douglas Con. Copper Co. for the quarter ended June 30 shows as follows:

Receipts—	
Assessments	\$ 88,936.48
Ore settlements	105,344.12
Mine office petty cash	524.25
Miscellaneous	573.97
Insurance claim (fire)	293.90
Accounts receivable	1,851.31
Total	\$197,524.03
Disbursements—	
First mortgage bonds redeemed	\$ 14,000.00
Interest on bonds	12,328.72
Assessment expense	294.80
Mill plant equipment	19,350.16
Mill construction payroll	10,226.22
Mill operating payroll	6,348.17
Mine operating payroll	32,493.99
Notes payable	11,012.75
Interest on notes and accounts	1,041.86
Casualty insurance	465.91
Mine plant fire insurance	1,906.90
Mill plant fire insurance	3,183.35
Nevada Copper Belt R. R. Co. Loans	51,059.55
Power for operations	1,357.35
Western Nevada mine operations	1,558.63
Western Nevada bond and lease	15,000.00
Miscellaneous bills payable	11,384.72
General office salaries	2,227.50
General office expense	393.30
Mine office expense	441.46
New bunk house	150.00
Deferred wages	45.50
Taxes	1,223.17
Total	\$197,524.03

Inspiration Con. Co.

Even with a comfortable cash balance and earning at the rate of \$20 a share, it is not expected that the Inspiration Con. Co. will increase its \$2 per share quarterly.

More than 16,000 tons of ore have been treated daily for some time past in the 18 operating units of the concentrator. The two additional sections, now under construction, are expected to be ready before the end of the year, making possible the handling of at least 1800 tons more per day. Next year Inspiration will doubtless start on a new construction program with the erection of a leaching plant to treat its oxide ores. This will cost several million dollars as the capacity will be in the neighborhood of 5000 tons a day. Further development should result in large additions to the oxide ore body.

Attention will also be given the tailings, and before long a test mill and experimental plant will be in operation at the concentrator to work out this problem. With the completion of its leaching plant—by the end of 1917—Inspiration will be in position to produce 150,000,000 lbs. of copper a year at a low cost. The company will be in position to finance its leaching plant from treasury funds and at the same time have a comfortable surplus against the day when copper sells at considerably less than it does today.

Granby Con., B. C.

The August production of Granby Con. was 3,218,847 lbs. of copper, against 4,268,846 lbs. in July. A shut-down of several furnaces at the old Grand Forks smelter was responsible for the loss. Within the past fortnight, however, one of the idle furnaces has been put into blast and the other will be blown in shortly, so that production from that property should be normal for October.

The company's copper production for the past 8 months shows as follows:

January	3,122,879	May	4,727,929
February	2,690,265	June	4,011,361
March	3,555,411	July	4,268,846
April	3,950,469	August	3,218,847
8 mos., 1916	29,546,097	8 mos., 1915	25,075,403

The company's fiscal year ended June 30. Earnings of about \$5,000,000 were realized. The Midas mine in Alaska,

which Granby bought several years ago, has finally started shipments of ore to the Anyox smelter. This ore runs high in gold values.

Butte & Superior.

The Butte & Superior Mining Co.'s preliminary report for August on oil flotation plant compares as follows:

Comparison follows:	Tons ore.	Costs per ton.	Zinc con- cen. tons.	Value per ton.
August	31,733	\$4.89	7,502	\$49.45

Standard Silver-Lead, B. C.

The net earnings of the Standard Silver-Lead Mining Co., Silverton, were \$56,609 in July, according to the official report accompanying the dividend payments for September. The surplus on Aug. 1 was \$296,381. The shipments for the month were 429 tons of lead-silver ore and concentrates, and the zinc sales amounted to \$63,980, including back settlements for several months, the shipments for the period being 500 tons of zinc concentrates.

The financial statement for July follows:

Preliminary settlements for 429 tons of silver-lead ore and concentrates	\$ 47,775
Zinc sales, including back settlements	63,980
Expenses	211
Boarding house	4,696
Total	\$116,572
Less final settlements for May and zinc penalties for February and March	17,028
Net receipts	\$ 99,544
Disbursements—	
Ore production, including mining, tramming, milling, shipping, marketing, power, general expense, salaries, taxes, etc.	\$ 28,521
Boarding house	3,607
Development	3,591
Construction	3,628
Aylard tunnel	1,812
Store supplies	872
Home office expense	904
Total disbursements	\$ 42,935
Cash statement—	
Net profit for July	\$ 56,609
Balance on hand July 1	289,772
Total	\$346,381
Dividend No. 44	50,000
Balance July 31	\$296,381
Recapitulation—	
Cash in banks	\$219,209
Ore shipped but not settled for	122,678
Total	\$341,887
Vouchers payable and payroll	45,506
Balance July 31	\$296,381

American Zinc Co.

American Zinc, Lead & Smelting Co. is credited with August earnings amounting to close to \$350,000. According to a conservative estimate the company and Granby combined should show profits close to \$9,500,000, and given another year of present spelter conditions the cost of the Granby investment can be written off the books from Granby profits alone.

There is a very active demand for the various grades of spelter produced by the American Zinc, Lead & Smelting Co., and the company is making contracts for delivery as far ahead as next June at very satisfactory prices—figures which 2 years ago would have been considered "beyond the dreams of avarice." The American Co. has on its books today

unfilled contracts calling for the delivery of well over 25,000,000 lbs. of spelter.

At the moment there is an extraordinary demand in the market for both spelter and copper for the manufacture of brass. Some huge orders for brass have recently been taken for shipment to Europe. One specific order of which we have knowledge calls for brass rods to be shipped to English plants, there to be utilized in the manufacture of finished munitions.

Brass manufacturers are buying freely well into the first quarter of 1917 and are paying advancing prices for both copper and spelter.

Federal Mining & Smelting.

Federal Mining & Smelting Co. reports for quarter ended July 31, compared with previous quarter:

Quarter ended July 31, '16.	Quarter ended April 30, '16.
Total	Total
Depreciation	Depreciation
Net profit.....	Net profit.....
Total tons shipped....	Total tons shipped....

Net profits for year to July 31, 1916, were \$624,029. Two dividends of 1% on preferred, amounting to \$119,861 each, have been paid during year, and another of the same amount declared, payable Sept. 15, 1916. Developments at Iron Mountain mine have been unsatisfactory, and it has been decided to suspend operations there.

Miscellaneous Company Notes.

The Pinar Copper Co. has been incorporated at Dover, Del., with a capitalization of \$5,000,000.

The Arizona Commercial Copper Co. has declared an initial dividend of 50 cts. per share, payable Oct. 31, to stock of record Oct. 10.

Elaborate plans for increasing the production of the Chile Copper Co. are reported under way. Work on these plans has been carried on and will be completed in 2 or 3 months.

Earnings of the National Lead Co. are reported running at a rate that will insure continuation of the 4% dividend on the common stock, even if there should be a considerable slump in the white lead industry.

The shareholders of the Nabob Mining Co. will hold a special meeting in Kellogg, Idaho, Oct. 2 for the purpose of passing on a resolution to increase the capital stock of the company from 1,500,000 to 2,000,000 shares.

For the quarter ended Aug. 31 the Beaver Con. Mines, Ltd., reports as follows: Bullion in storage, 271,022.62 ozs.; ore at smelters, 18,479.11 ozs.; ore bagged at mine, 24,404 ozs.; total, 313,905.73 ozs. Cash on hand amounted to \$43,020.57.

The Kerr Lake Mining Co. reports for the year ended Aug. 31 as follows: Ore sales and miscellaneous income, \$1,212,676; net profit, \$813,000. This compares with ore sales and miscellaneous income of \$908,019 in 1915, and net profits of \$450,774.

During the quarter ended June 30 the Dr. Jack Pot Mining Co. and its lessees produced 5182 gross tons of ore of a gross value of \$43,260 and a net value of \$21,883.23. Net to the company was \$16,974.79. The gross value of all ores shipped during the quarter was \$8.75 per ton.

The production of the Nipissing Mines Co. for August is valued at about \$203,808, showing a profit of about \$121,555, against production of \$288,577 in July. At the present rate of production Nipissing should show increased production for this year over 1915 of about \$500,000 and increases over estimated profits of about \$250,000.

The Goldfield Con. Co. mined 26,700 tons in August, from which there was a net realization of \$30,016.12. Mining costs were \$2.58 per ton, with total operating costs of \$5.62 per ton. Net costs were \$5.63 per ton. On account of the lack of equipment to settle and filter the flotation concentrates,

and on account of changes in the ore, flotation has been abandoned temporarily at the Consolidated mill pending the installation of additional equipment.

The Nipissing Mines Co. has declared a regular quarterly dividend of 5% and an extra dividend of 5%, both payable Oct. 20 to stock of record Sept. 30. Financial statement of Nipissing Mines Co. at end of first quarter shows cash in banks as \$1,218,438, value of ore and bullion in transit \$457,359, value of ore mined and on hand \$499,956.

Directors of the Champion Copper Co. have declared a dividend of \$6.40, payable Oct. 8—making \$74.40 per share since Feb. 21, 1915, when payments were resumed following suspension from Oct. 15, 1913. The dividend disbursements of the company are divided equally between the Copper Range Co. and the St. Mary's Mineral Land Co. as owners of 50,000 shares each.

Stockholders of the New York & Honduras Rosario Mining Co. have voted to increase the board from 9 to 11. One of the new vacancies was filled by the selection of H. A. Guess, managing director of the mining department of the American Smelting & Refining Co. He has been identified with that company for 15 years, and is also consulting engineer of the Braden Copper and Chile Copper companies.

Edward J. Cornish, the newly-elected president of the National Lead Co., has been connected with the company since 1906 and has served as vice-president since 1910. He was born in Sidney, Iowa, 1861. He practiced law in Omaha and formed the Carter-White Lead Co. of that city. When he sold stock of the latter company to National Lead Co. in 1906 he remained president of the subsidiary for a while and then took charge of the National's Chicago branch.

Directors of Mass. Con. Copper Co. are scheduled to meet some time next month to take action on the quarterly dividend, the second to be declared by the company. The initial dividend was paid Aug. 15 and was for \$1 per share, or a total of \$100,000. The company's net profits have ranged from \$17,000 a month in January to \$66,225 in May. At this rate profits are at a rate of \$7 a share per annum.

At the recent meeting of stockholders of the Ohio Copper Co. a committee was appointed to care for the interests of the stockholders in the efforts to take control of the property from the bondholders. To represent the New England holders George E. Macomber, president, of Augusta, Me., Trust Co., was appointed. Westerners have Frank B. Cook of Salt Lake, while from New York there have been selected Charles A. Kittle, E. S. Hooley and Hubert E. Rogers. This committee selected New York Trust Co. as depository for shares. It was the North American Liquidation Co. that secured a stay of final approval of recent foreclosure sale of the Ohio property.

The directors of the New Baltic Mining Co. have called an assessment of \$1 to be paid October 14. In June a year ago an assessment was called which yielded nearly \$70,000, of which \$40,000 was paid to the New Arcadian in part payment for the land purchased, and the greater part of the remainder has been spent for diamond drilling of several holes, taxes, etc. Present assessment was called as a shaft has to be sunk and much development done. Ground has been broken for the shaft, about in the center of the ten acres just secured from the Johnson heirs in northeast quarter of the northwest quarter of Sec. 16. The location is between two diamond drill holes that disclosed good cores.

There is much talk these days of a consolidation of the American Zinc Co. and Butte & Superior Co. Each of these companies is assured of profits this year of between \$9,000,000 and \$10,000,000. Butte & Superior has distributed its earnings in dividends; American Zinc has invested its profits in new property. It is not understood that any merger is close at hand, but if these properties are brought together it will undoubtedly have to be on some basis more favorable to American Zinc than the two-for-one basis at which Butte & Superior recently acquired 35,000 shares of American Zinc. With or without consolidation the new American Zinc Co., according to its own directors, can earn \$1,500,000 on 5-ct. spelter.

Copper Market Strongest in History.

As was very aptly expressed in our metal market review last week, the pith of the copper market is that *demand* is in excess of the *supply*, and the copper market of today is *not* a competitive market by any manner of means.

That this summing up of the situation was correct is corroborated by the placing last week of the largest single order for copper ever negotiated in the history of the copper trade—being no less than for a total of 448,000,000 lbs. of copper, involving an expenditure of approximately \$125,000,000, and at a cost around present market quotations—27 cts. per pound.

This order calls for practically 50% of America's entire output from Jan. 1 to July, 1917. Up to June 1 of this year, a period of 6 months, the Allies purchased copper to the extent of nearly a half billion pounds. Since the beginning of the year including the present order Great Britain and her allies have negotiated for nearly a billion pounds of copper, involving an expenditure in the neighborhood of \$230,000,000.

The closing of the above order places the copper metal in the strongest position known to the industry and an increase in present price is a logical conclusion.

It is figured in the copper trade that if the enormous options signed are taken advantage of to the full, there can be no reduction in price of copper throughout 1917, which should give all copper companies bigger earnings for a year to come than they have enjoyed in the past year, with consequently liberal distributions to shareholders.

John D. Ryan, who has read the copper market correctly for so many months, thinks the metal will command very high prices for another year. The president of the Anaconda bases this view not only on the foreign situation but the probability that domestic industry will be a heavy consumer of the metal during the next twelvemonth. Incidentally there is talk of a boom in real estate and the building industry as a consequence of cheap money and gold inflation. That, of course, tends to bear out the Ryan idea that home demand for the copper metal is going to be an important factor in the latter industry.

Anaconda's Great Activities.

From present indications Anaconda Copper Co. will earn in excess of \$25,000,000 during the first half of 1917. The company is in an excellent financial position, backed up with vast resources in cash and great property assets resulting from efficient management, and the adoption of new metallurgical processes which have made possible substantial economies in all departments.

After the payment of the 1917 half-year's dividends at the rate of \$2 quarterly, amounting to \$9,325,000,

and allowing for the retirement of the \$16,000,000 notes which fall due next March, the result should be a grand total of something like \$28,756,250 net for the 18 months ended June 30, 1917.

The second of five sections of the company's new zinc refinery at Great Falls will be put into commission at once, and by Nov. 1 the entire plant will be put in operation turning out high-grade zinc at the rate of 5,000,000 lbs. per month. The first week's experiment with the first section proved most satisfactory. 5000 h.p. brought from Rainbow and Big Falls plants of the Montana Power Co. being used in operating this section. With its 144 electrolytic tanks it is making between 20 and 25 tons of zinc per day, which is being shipped to Anaconda, as the furnaces at Great Falls are not completed. Two 50-ton furnaces are being rushed to completion at Great Falls, and one of these will be ready by Oct. 1. Tanks for the third section are now being installed, and the third of five rotary transformers that will furnish direct current for the zinc refinery will be ready for operation by Oct. 1.

The zinc concentrator at Anaconda is now handling 1000 tons of crude ore per day making zinc concentrates for both experimental plant at Anaconda and two sections of the zinc refinery at Great Falls. The tonnage will be increased to 2000 tons per day by Nov. 1. The company is rushing work on the developments of the zinc ore bodies at the Douglas, Emma and other mines.

Help the Little Fellow.

Some complaint is made throughout western mining districts to the effect that the custom smelters refuse to receive the ore shipments of small producers. There is a congestion of ore at all the smelting plants, and this is the cause of the curtailment of shipments. However, many of the small operators, whose properties are under development, claim the smelters have not refused to handle the increased tonnage of the larger mines.

The small operator as a rule depends upon the sale of ore to enable him to advance his development, and when the only available markets are closed to him he is severely handicapped. To make a prospect produce ore sufficient to pay for its own development is a method which enhances the mining industry and should be encouraged, not retarded. It would seem that some preference should be given those small producers whose output is incidental to development, and the marketing of which is essential to continuance of operations.

The big producer is relied upon to keep the smelter in operation, and it is easy to understand the good relations between the two; at the same time, the growth of the mining industry depends upon the coming in of new producers, many of which have to

pass through a difficult period of early development. To encourage the small ore shippers is to make possible the opening of new mines.

No sooner does good news come out of Mexico that Gen. Carranza has revoked certain special mine taxes that would prove of considerable benefit to mining men, than comes the announcement that another decree is in contemplation which would work certain hardships. Following the decree of revocation as outlined in our last issue, comes the announcement that a decree is now under consideration which proposes to increase the taxes to a practically confiscatory rate on developed mines in specified districts now closed on account of unsettled conditions, which are not put in operation within 60 days. The report states that this is designed to give employment to idle Mexicans.

Calumet & Hecla is one of the most widely held mining stocks in the world today, having no less than 4300 stockholders, several hundred of whom own but one share. The largest single holding is that being held by the trustees of the Quincy A. Shaw estate—13,100 shares—dividends on which this year will total no less than \$917,000. The Agassiz family control 6193 shares from which they will receive during the year as their share of dividend disbursements the sum of \$433,510. Shares of the company are scattered all over the world, being held in the United States, Austria, Ireland, Germany, France, Spain, England, and Switzerland.

As a result of the present and possibly later scarcity of cyanide, the U. S. Smelting Co. is considering the installation of a new process, eliminating cyanide, for treating its ores. Should plans now under consideration prove successful it will prove of the utmost importance to the company as the shortage of cyanide has restricted the company's operations to a large extent. At present all but a very small percentage of the silver and gold in its Mexican properties is recovered by the two big cyanide units, one with 1200-ton daily capacity for the Pachuca district, and the other of 800 tons in the Real del Monte district.

Mining furnishes employment for all classes of men, from the most highly educated to the most ignorant. The latter, however, are merely laborers. The direction of mining operations as well as much of the actual work involved, requires men of training and more or less education. Owing to the fact that mining involves every branch of engineering and nearly every science, a broad education is necessary for the men who must hold the higher positions. The man farther down the ladder need not despair, however, of getting higher if he is ambitious. Any man who has the courage and persistence can improve his condition by study.

PERSONAL.

Chester Master is now managing the La Blanca mine, Pachuca, Mexico.

D. P. Mitchell, mining engineer, London, E. C., will be in New York during October.

Fred B. Mitchell, Iron River, Mich., has been elected mine inspector of Iron county.

R. A. F. Penrose, mining engineer and geologist, Philadelphia, Pa., is in Denver, Colo.

E. L. Latta, superintendent of the Idora mine, Wallace, Idaho, has been in Spokane, Wash.

Capt. John Warne of the Allonez mine in the Michigan copper country, resigned last week.

George Farish, mining engineer, New York, is examining properties near Boston creek, Ontario.

C. Q. Payne, mining engineer, New York, has gone to San Francisco, Cal., from Oatman, Ariz.

Arthur K. Adams, El Paso, Texas, has been appointed geologist for the Andes Copper Co., Chanaral, Chile.

C. O. Lindberg, mining engineer, Los Angeles, Cal., is in Nelson, B. C., investigating the zinc resources of the province.

R. E. Rickard, assayer for the Seoul Mining Co., Korea, has left for London, E. C., where he will enlist in the British army.

F. Ward Paine of Boston, director in the Lake, Copper Range and other companies, is now in the Michigan copper district.

Wilson Hughes, mining engineer, Los Angeles, Cal., is now superintendent of the Monitor Belmont Mining Co., Belmont, Nev.

Leo Greenough, manager of the Snowstorm Mines Con. Co., Larson, Idaho, has returned to Spokane, Wash., from the property.

Francis C. Lincoln, professor of mining and metallurgy, Mackay School of Mines, Reno, Nev., has returned from Bolivia, S. A.

H. H. Knox, consulting mining engineer, New York, has left for Siberia on professional duties and will return in January, 1917.

Frank Cottier has resigned as superintendent of the Ella W. mine, Cripple Creek, Colo. The vacancy will be filled by M. Johnson.

W. R. Millard, superintendent of the Granite Gold mine, Valdez, Alaska, has returned from Rochester, Minn., where he underwent an operation.

Ellard W. Carson, formerly general manager of the Cambria Quicksilver Co., Cambria, Cal., is now with the Alpine Quicksilver Co., Hernandez, Cal.

H. W. Witt and J. P. Kender, mining engineers with the Goldfield Con. Co., Goldfield, Nev., are examining properties in the Sheep Creek district, British Columbia.

Fred Hellman, general manager of the Chile Copper Co., has been appointed consulting engineer of the company to succeed Pope Yeatman.

B. L. Thane, resident manager of the Jackling-Hayden interests, Juneau, Alaska, has been reappointed, his contract having expired in May.

J. V. Richards and U. T. McCurry, mining engineers, Spokane, Wash., have recently returned from a trip of inspection to Kaslo, B. C.

Harry B. Barling of Breitung & Co., Ltd., 11 Pine street, New York, has returned east after a professional trip to several western states.

Edward L. Dufourcq, consulting mining engineer, has removed his offices from the Produce Exchange building to No. 18 Broadway, New York.

R. M. Atwater, consulting engineer, New York, and director of the Rex Con. Co., has been in Wallace, Idaho, inspecting the company's holdings.

F. G. Clapp and C. T. Griswold have recently been engaged in geological examinations in Texas on behalf of clients of the Associated Geological Engineers.

Fred G. Farish, mining engineer, Denver, Colo., and manager of the Lluvia de Oro Gold Mining Co., Chihuahua, Mexico, is returning from a trip into that country.

Lyon Smith, former metallurgist with the Snyder Electric Furnace Co., Chicago, is now assistant superintendent of the River Smelting & Refining Co., Florence, Colo.

Capt. Thos. Hoatson of Calumet, Mich., director of the Calumet & Arizona, Keweenaw Copper and other mining companies, is making a trip to California and Arizona points.

W. Earl Greenough, Wallace, Idaho, has resigned as superintendent of the Marsh mine and director of the company. He will later start a consulting practice in Spokane, Wash.

H. C. Bellinger, manager of the Guggenheim Exploration Co.'s smelting interests in Chile, is now in Kiesling, Wash. He will leave shortly by way of New York to resume his duties in Chile.

COMMUNICATIONS.

[This department is for the exchange of ideas bearing on all branches of the mining and metallurgical industries. Mining and Engineering World will not be responsible for the statements made nor opinions expressed by correspondents.—Ed.]

Who Is Your Engineer?

The Editor—I was very much interested in the article in your recent issue by G. A. Collins entitled "Who Is Your Engineer?"

This recalled to me an incident which occurred in one of the western states while I was engineer for a property near by.

Nearly half a million dollars had been spent and not much accomplished on the road to success. In the first place, the eastern stockholders who were putting up the money put a farmer, one of their kin, in the position of manager, thinking in this way they would have a man to be depended upon, who would devote all his energies to the development of the mine. A number of the investors wanted an engineer's report on the property; also they wanted a consulting engineer. These needs were complied with.

The engineer obtained, if he could be called such, had probably never done any real mining, but this made no difference, as he was well known by the promoter and related to several of the stockholders; furthermore, he agreed to take 50% of his salary in stock. This man was chosen to be consulting engineer and to make the official report (as it was called). He explained in glowing terms the great possibilities in store for the investors, citing numerous of the larger mines as examples, and advising the immediate erection of a mill. This was done without even correctly obtaining an average assay of the exposed ore; the only assays being made were from specimens secured by promoters and stockholders while investigating the property.

By the time the mill was completed the type of ore had changed, making the proposed and installed method of treatment almost useless. How the promoters managed to get around this and raise sufficient capital to keep the mine run-

ning, employing about 40 men, is not known to me. Six or 8 months after the erection of the mill they were enabled to secure enough ore to run it about half the time, making a saving of only 50% of the values in the ore.

The consulting engineer finally resigned and an engineer well known by the promoter succeeded him, the manager then resigned, taking a minor place and leaving his son in charge of the property. The young fellow had recently graduated in *pharmacy* from one of the leading universities.

The mine to my knowledge was a very good prospect, and under good, intelligent, technical supervision could have become a good producer, but it was not rich enough to pay dividends under a management of men fitted for other callings in life. The property was operated 3 or 4 years before going into the hands of a receiver.

If the man who invested \$10,000 in stock had first employed an engineer who really knew his business to investigate for him, he would have saved his money, or probably invested in a property which would have yielded him profits; or at least a fair run for his money.

Herculaneum, Mo.

S. PAUL LINDAU.

NEW PUBLICATIONS.

Bibliography of North American Geology for 1915. By John M. Nickles. Washington, D. C., U. S. Geological Survey. Bulletin 645; pp. 144.

In the bibliography proper the classification is made alphabetically according to the authors name. The subject and place of publication are given. There is also an index in which the different articles and publications are classified by subjects and geographically.

Gold Mining in the Willow Creek District, Alaska. By Stephen R. Capps. Washington, D. C., U. S. Geological Survey. Bulletin 642-F; pp. 6.

The gold from this district, as given by the report, is derived principally from three mines, though many others not yet having reached the producing stage, are being worked. Brief descriptions are given of the more important companies and claims being worked in the district.

Construction and Operation of a Single-Tube Cracking Furnace for Making Gasoline. By C. P. Bowie. Washington, D. C., U. S. Bureau of Mines. Technical Paper 161; pp. 16; illustrated.

Drawings and description, with views, are given. The first pages are devoted to the construction of an experimental plant and in the following pages the precautions to be noted in construction and operation are reviewed.

Geology and Underground Water of Luna County, New Mexico. By N. H. Darton. Washington, D. C., U. S. Geological Survey. Bulletin 618; pp. 188; illustrated.

The geology of the formation considered in this bulletin is given only in so far as it is related to helping solve the problem of the probability of underground waters in the area which includes Deming, N. M. In this respect, however, a very complete review of the formation included in the area is made.

Determination of Aluminum as Oxide. By William Blum. Washington, D. C., U. S. Bureau of Standards. Scientific Paper No. 286; pp. 20; illustrated.

A description of the method, apparatus used and results obtained are dealt with and compared with other well-known methods. The method is essentially an ordinary gravimetric method of analysis. Considerable of the method is based on the use of the hydrogen electrode. By means of this piece of equipment the end point can readily be detected and the danger of resolution by the hydroxide precipitant or incomplete precipitation is eliminated. This has been a great fault in many gravimetric methods in which the aluminum is determined as an oxide and is usually precipitated by some base hydroxide.

TRADE PUBLICATIONS.

Lubrication of Internal Combustion Motors. Pratt & Washburn Refining Co., New York. Booklet; illustrated.

Though an advertising medium information of general use is given preference and the proper methods of lubrication of all different types of internal combustion engines is taken up. It further deals with methods of refining oils and testing the same for properties which affect the lubricating properties of the oil. The different grades of oil are spoken of and the parts and places where they can be used most advantageously for lubrication are mentioned. Lubricating systems for different classes of internal combustion motors are described.

Welder on Steam Receivers. The Elliot Co., Pittsburgh, Pa. Bulletin F; illustrated.

The receivers are made for both vertical and horizontal pipe runs and for connections at angles. Separating the water from the steam is accomplished by slowing up the steam's velocity and changing its direction of flow. The moisture thus drops to the bottom of the receiver and is kept from getting into the outlet by baffle plates. The receiver can be had of either welded or riveted construction or a combination of both. The interior parts, however, are welded to the outside shell and the flanges are screwed onto the inlet pipes and welded in place.

Steam Turbines for Direct Connection. The Terry Steam Turbine Co., Hartford, Conn. Bulletin 20; pp. 8; illustrated.

A separate reprint accompanies the above bulletin on "The Exhaust Steam Turbine," by J. Breslay. This article discusses the advantages of low and mixed pressure turbines for plants already constructed but needing additional power units. Many good curves and drawings of installations are reproduced. The bulletin consists of a number of short talks on the use, proper construction and design of turbines for different uses. Among these are condensing and non-condensing turbines; turbo-generator sets; low-pressure, high and low-pressure and mixed-pressure turbines; turbo-pump sets; turbo-blower sets; vertical sets and belt drive.

Scientific Water Purification for All Purposes. Wm. B. Scaife & Sons Co., Pittsburgh, Pa. Pp. 72; illustrated.

The advisability of softening and filtering water before using it in many of the places where water is commonly used is frequently brought out in the text of this publication. For the greater part softening and filtering systems of fair size only are considered and the methods by which the company studies and makes tests for each particular installation are described. Filtering systems for water to be used in the laboratory, in some operation in the plant, for condensing, cooling and boiler feed water are described in different sections. The reasons why the water should be treated in each of these cases is also brought out and in the case of boiler feed water comparative curves are reproduced showing the consumption of fuel per k. w. hour before and after the boiler feed water was treated.

INDUSTRIAL AND TRADE NOTES.

The Pacific Tank Co. has its offices again at the old location—No. 318 Market street, San Francisco.

The Galigher Machine Co., Salt Lake City, has found it necessary to seek larger quarters for its steadily increasing business and will erect new buildings on Eighth South and Fifth West streets. The main machine shop is to be 330 ft. long by 60 ft. wide. This and the other buildings to be erected will be of steel and concrete. The company manufactures mining and concentrating machinery and has occupied its present quarters since 1903. E. F. Holmes is president of the company; J. E. Galigher, vice-president and general manager, and W. W. Armstrong, secretary and treasurer.

Late News From the World's Mining Camps

Editorial and Special Correspondence.

ALASKA.

Gold mining in the Willow Creek district is the subject of a report by S. R. Capps, recently issued by the Survey as Bulletin 642-F. The region has recently been the scene of active prospecting, and plans are under way for mining on several properties as the result of the beginning of the construction of the new government railroad, which will pass along the border of this district. For several years gold has been produced from lode mines in this region, and in 1915 the value of this product amounted to nearly \$250,000. Observations made at several of the more developed properties indicate that the lodes persist to considerable depth and that the ore from the deeper levels will probably be free milling.

Knik.

William Martin expects to further develop the Martin-McCoy claims in this immediate vicinity and will freight in the mill and other machinery this winter to be installed next spring.

Ira and Charles Isaacs have bonded their claims in the Willow Creek district adjoining the Martin-McCoy group to C. E. Herron, who has commenced work in further developing the property and has secured Chas. Spaulding to superintend the work. A force of 6 miners has been put to work and a large outfit hauled in for several months' work. It is Herron's intention to haul in timber and machinery this winter for next season's operation. The deal calls for three claims. The bond consideration is \$60,000. This property, now known as the Herron property, is a continuation of the famous Mabel lead.

Juneau.

The Granby smelter, British Columbia, has received 1200 sacks of ore from the Venus mine, one of the Conrad properties on Windy Arm. This makes the third shipment from this mine. James McFarland, superintendent for the Harper interests, is making preparation to commence work on the Montana mine. A force of men are at work taking the ice and water out of the mine. Both of the foregoing mines are being developed by the Harper interests. The Montana has in years passed produced considerable good ore. Among mining men it is known as one of the best properties in the Varcross district. The M. & M. mine, which was formerly worked under the Conrad management and by subsequent lessees, has produced ore valued at \$165. McFarland expects his first shipment from the M. & M. to bring back \$180. He also has begun development work on the M. & M. on Polley Gulch. Three men are breaking and sacking high-grade silver. The outlook is encouraging. Work will be pushed through the winter at practically all of the mines now being opened by McFarland. A good force of men are working on the various properties and indications point to a continuance of shipments during the fall and winter months.

ARIZONA.

Miami.

Underground, on the 6th or main haulage level of Inspiration, a locomotive repair shop is being constructed near the Scorpion shaft. The shop will contain a pit necessary in making repairs to the underside of a locomotive. The pit and the floor of the station will be supported by structural iron, making the station substantially fireproof. A forge, lathe and drill press will be installed, thus enabling the carrying out of

roundhouse repairs without the necessity of having to take the locomotive to surface. The efficiency of reinforced concrete as an underground structural material is well exemplified in the case of the construction of the main shafts, with stations and skip pockets. The openings comprising the stations and pockets are unusually large, yet the reinforced concrete constituting the walls and roof of these openings show, after having been in place almost 1½ years, no indication of the ground pressure.

Douglas.

Nacozari Con. reports that the wagon road from the mine to the S. P. railroad at Old Nacozari has been completed. No. 3 glory hole has recently been commenced in the main tunnel, and has been extended 100 ft., encountering 9½% copper. As soon as this raise has been completed to surface, the main tunnel will be driven through to the Copper King in order to thoroughly open up the Pilares Copper reef, which crosses the Nacozari Con. at this point. Assay returns received from the El Paso smelter covering a carload of ore shows values as follows: 118 ozs. silver, \$1.70 gold, 1.35% copper, 12% lead and 15% zinc. About 40 men are now employed by the company.

Jerome.

One day last week the Venture Hill in a round of shots opened up a body of ore in the face of the tunnel on which the principal development work has been done, revealing 8 ins. of native copper on the hanging wall, paralleled by a vein of malachite from 2 to 2½ ft. in width. The discovery was made 275 ft. from the surface, 87 ft. distant from the old workings in the tunnel. Samples were declared to be identical with the character of the ore found on the 1200 level of the United Verde Extension. Venture Hill stock, following the news of the strike, has made a remarkable advance, and demands for it have been received from all parts of the country. John S. Reilly is superintendent.

Progress in enlarging the shaft on the Jerome-Verde from one to three compartments has been slow during the last week, owing to the fact that heavy ground has been encountered, into which it has been necessary to drive a great deal of piling. The shaft is now enlarged down to more than 490 ft. and the heavy going will soon be passed and sandstone encountered. The water in the shaft is not bothering the workmen, it being kept just a few feet below them. The present pumps on the property are capable of emptying the workings in a few days if necessary.

Among the newer properties that are attracting the attention of mining men and investors is the United Verde Con. Co.'s, Jerome. This company has taken over the Mahurin and United Verde Jr. claims and is mapping out a plan for extensive development work. Engineer George A. Bethune of San Francisco has been looking over the properties for several days, and it is reported exploration with diamond drills will be started on both properties following his report. This company is also reported to be negotiating to take over 10 claims in the Dewey country now owned by George Human. These claims are said to have a good copper-gold showing and will be examined by Bethune within the next few days.

The crosscut that is being driven southward from the 500 in the shaft of the Pittsburgh-Jerome is 4 ft. in quartz and soft talc that is heavy with copper carbonate and glance. The showing was encountered 300 ft. from the shaft, and owing to the soft character of the formation, is considered certain that much of the copper has been leached out and will be found below. As the whole formation is pitching sharply to the north the ore will eventually be cut by the shaft. Work is being concentrated in the south crosscut with a

view of proving the width of the new ore body. As soon as the new road to the Pittsburgh-Jerome property, now under construction, is completed, the new compressor, hoist, and other equipment will be rushed to the mine for installation and development, which should soon bring it into the producing class.

Prescott.

Considerable excitement in the Crown King district has followed the strike made recently in the Fairview mine. A sulphide ore body for the full width of the shaft has been uncovered. A vein 18 ins. wide is located near the mouth of the tunnel and work of sinking has been under way but a short time. Until the time of the recent strike the principal work on the Fairview has been the extending of the tunnel, a 3-ft. body of oxidized ore, giving about \$30 in gold, having been developed.

Perfection of plans for developing the Black Chief mines, near Dewey, has been completed and development started. The main shaft being sunk from the 100 level is progressing rapidly and a depth of about 50 ft. has been reached, with ore conditions satisfactory. Sinking will continue, with other exploration, until the 300 level is reached.

Pumps of sufficient capacity to handle any flow of water that may develop in the shaft, and a new hoist, compressor and other equipment are on the way to the Dundee-Arizona property. The Dundee shaft is now making 600 gals. of water an hour, and it is reported that the new pumps are to have a capacity of 2000 gals. Although no work has been done in the shaft since water was struck last week, the superintendent has been busy since then completing the raise from the tunnel level to the crosscut that was run westward from the 65 point in the shaft.

CALIFORNIA.

Jackson.

With the exception of the Old Eureka mine at Sutter Creek, and the Keystone and Little Amador at Amador City, every gold mining property in Amador county is idle and 1850 men are on strike. Mine operators declare the mines have been closed for an indefinite period and that the demands for higher wages will under no consideration be granted. The miners demand \$3.50 per day and \$3 for carmen and muckers. At the Old Eureka, Keystone and Little Amador the advanced scale prevails. Thus far no trouble has developed. The majority of the men are from southern Europe and it is thought probable that clashes will develop, although leaders assert there will be no violence. Operators met the strike with a lockout. Amador county is the leading gold producer of California and the strike is certain to seriously cut down the annual output of the state.

Grass Valley.

All miners in the Grass Valley and Nevada City districts have been granted an advance of 25 cts. per day in wages and there is no fear of the Mother Lode labor troubles invading this field. Mine managers state the raise was made as much to retain efficient men, tempted by the high wages prevailing in the copper regions, as for any reason. No labor trouble is considered, as this field has been remarkably free of such disturbances and the best of feeling prevails.

The Empire Mines Co. has arranged for the building of an electric railway from the Pennsylvania mine to the Empire mill, a distance of a mile. It has been decided to increase the capacity of the mill from its present 60 to 100 stamps, and to crush ore from the combined properties. As soon as it is in commission the 20-stamp Pennsylvania mill will be dismantled. The enlarged Empire plant is intended to treat 600 tons per day, making it the largest quartz mill in California. Late developments in the Empire at a depth of 4000 ft. have been highly encouraging, the new vein at this point proving to be one of the best ever developed in the district.

Another rich discovery has been made in the Golden Center, the strike being made at an approximate depth of 1000 ft. Much specimen ore shows and the vein is stated to be

over 3 ft. in width. Driving of a crosscut to tap the deposits in the adjoining Peabody mine will be started shortly from the newly opened 1000 level of the Golden Center shaft. Arrangements have been made to materially augment the capacity of the mill. At its Allison Ranch property the company has unwatered the shaft to a depth of 80 ft. and is retimbering portions. Equipment is arriving for the new mine plant and mill and the management expects to have it installed by the end of November. The pumps and hoist will be installed first and unwatering of the shaft rushed.

Keeler.

A caterpillar train, consisting of an engine and 5 trailers, has been placed in operation between the Santa Rosa mine and Keeler. It has a capacity of 25 tons per trip. Driving of a new lower tunnel has started and is designed to intersect the ore bodies 500 ft. below present workings. Satisfactory developments will be followed by the driving of another lower tunnel. The management states 15 north-south veins outcrop, with more than 10 cross veins in evidence. The ore contains silver, lead and zinc, and much is high-grade. The property is controlled by the West End Co. of Tonopah.

Ore shipments from Keeler are the heaviest in history. Motor trucks and mule-trains are crowding the highways, and the railroad is taxed to capacity to get consignments to the smelters. The Cerro Gordo is maintaining a particularly heavy output, and is also shipping to advantage the slag deposited when the old furnaces were operated. Most of the ore going out from the district contains zinc, or silver-lead.

Campo Seco.

Suits filed 3 months ago by 33 Mariposa county farmers against the Penn Chemical Co. have been dismissed by consent of all parties concerned. The suits were brought to recover damages alleged to be caused by fumes from the smelter near Valley Springs. It is understood the company compensated the farmers for all losses demonstrated.

Placerville.

San Francisco people have purchased the Rocky Bar gravel mine in the Fairplay district for \$50,000. Arrangements are being made for operation of the property along broader lines, and considerable new development work will be done. The mine is excellently equipped and has long been one of the premier placer gold producers of the district.

Work has been started at the Pyramid mine, near Rescue, with a force of 15 men. The 500-ft. 2-compartment shaft has been unwatered and repaired and will be sent 200 ft. deeper. The mine contains considerable ore in old workings and is well equipped. Charles Evans is superintendent.

The Badger Hill gravel mine, near Camino, has been reopened after lying idle 22 years. The old tunnel is being placed in shape for extensive work and driving of a 600-ft. lower tunnel has been decided on.

Mokelumne Hill.

The Eclipse gravel mine in Chili gulch has been taken under bond by W. H. Morrison and J. Miller of Stockton, who are arranging for extensive work. The property is traversed by the Blue Lead channel and considerable black sand, carrying gold and platinum, occurs. New devices are being installed to save these values. The Eclipse is owned by A. H. McCarty of Mokelumne Hill.

Taylorville.

The report of the Engels Copper Co. for the half year ending June 30, 1916, has been issued. It shows gross earnings of \$175,578, and a net income of \$226,224. Large sums were expended on additional equipment and in the extension of new developments. Large deposits of profitable ore were indicated in outside ground by means of diamond drills.

Grass Valley.

The final payment has been made on the purchase price of the Union Hill mine and preparations are being made to send the shaft 400 ft. deeper and crosscut in expectation of intersecting the Union Hill and Georgia ledges. A new electrical plant will also be installed. Some good ore is being worked in the main levels and small shipments of scheelite are being sent out occasionally. The entire purchase price is said to have been about \$80,000. The present ownership is

comprised largely of San Francisco, Los Angeles and Pasadena people. The mine is equipped with excellent hoisting and pumping equipment, and a 20-stamp mill.

Hart.

Oro Belle Mines Co. will be taken over by a new company to be organized and in which John Hays Hammond and associates of New York have agreed with President W. B. Andrews and his directors to assume the controlling interest on an optional basis. This gold mine is for the greater part owned in the Copper Country and in Duluth, and it has 1,000,000 shares. It has a shaft 850 ft. deep that was thoroughly repaired about a year ago with considerable other exploratory work. In the two veins that have been opened there are gold values of commercial importance. R. C. Pryor, H. W. Fesing, R. M. Edwards and Prof. A. E. Seaman of the Michigan College of Mines, all of Houghton, are among the large stockholders, and the main office is located there. The details of Hammond's proposition have not yet been given out, but as far as it is known it is favorably regarded by the stockholders, and there will be no doubt of its ratification, when it is submitted at a meeting soon to be called.

COLORADO.

Cripple Creek.

At the 800-ft. or 10th level of the C. O. D. mine a 6 by 8 hoist to be operated by air has been installed and will be used for sinking. The work has been delayed, but Supt. Williams expects to start Oct. 1. The company is mining a good grade of milling ore from the main C. O. D. vein under development at the 6th level. The raise carried by the Sun Tungsten Co., Denver, on the new vein lying east of the main C. O. D. is entering richer ground and values have risen to as high as \$12 and \$15.

Settlement for a 2-car shipment from the Isabella Mines Co. has been made. The ore was mined by the company at the 15th level of the Lee shaft, from the ore shoot on the Buena Vista vein. One car of screenings brought 4.23 ozs. gold, \$84.60 per ton. A car of coarse rock returned higher values, the settlement having been 4.55 ozs., \$91 per ton. The net returns exceeded \$4000. The shoot on the Buena Vista from which this was mined has been stoped to a point above the 15th level within 40 ft. of the 14th level. A lateral is being carried out from the 14th level to tap this shoot. Ore with an average value of \$30 is also being mined by the company at the 15th level on the East Victor vein, and the winze being sunk to prove continuity of values is down 35 ft. with values holding. Work on the ore house for the Lee shaft is progressing. The building is equipped with ore washers and will be heated by steam. By Oct. 2 three of the bins will be ready for use.

The Gillard Tungsten Mining & Leasing Co. has recently loaded out a shipment from the property of the Gold Bond Con. Mines Co., on which the company has secured a bond and lease. The company recently purchased a hoisting plant from the S. H. Machine Co. of this city, and has ordered a 6-drill compressor from Denver. The company has plans under preparation for a 100-ton mill. Flotation and cyanide processes will be used. It is planned to treat low-grade custom ores.

Leadville.

According to John Nelson, who has the contract for timbering the Mikado shaft, the work will be completed by Sept. 30. Timbering has been finished from the collar to within 74 ft. of the water level at the 900 level. Foundations for the new hoist are being laid and preparations for the draining and developing enterprise planned for the property are being carried out. New surface buildings are being erected at the shaft preliminary to the installation of the power and machinery plant.

The sinking pumps at the Penrose are being moved to the bottom of the station, as sinking has been completed. The compartment containing water pipes from the pumps and cables is being cleared. While sinking was in progress two compartments were devoted to the pumps, both containing a

separate column and power cable. With the lowering of the water to the bottom level and the subsequent installation of the 2000-gal. station pump at the bottom, the service of both sinkers was no longer required. One compartment containing the original column for one of the sinkers and the new column for the station pump was then designated as the pumping compartment was undertaken. The two sinkers were moved from the shaft into the bottom station. One machine is now connected with its relief pump at the 450 level and is operating. The column for the other is being moved. This plan of concentrating the pumping power into the bottom station and gathering the water columns and cables into one compartment is for the purpose of opening two compartments for hoisting. As soon as the machinery is placed it is planned to develop the property on a large scale. Present reports state that the preliminary work at the Penrose will be complete by the end of September. Some development is under way in the upper workings, but this is more of a preparation for the work to come than a new undertaking.

Breckenridge.

Bulkeley Wells, formerly operating the Smuggler-Union mine, and now agent for a mining syndicate, is operating the old Puzzle mine for the Puzzle Leasing Co. He will proceed at once with preparations for sinking a 2-compartment shaft to 150 ft. below the tunnel level. The property is to be equipped with machinery for deep work. Electric drills are to be installed and one is on the ground and in operation. Installation of new machinery, overhauling of the present plant and other preliminary work will delay actual sinking until Oct. 1 or later. At that time it is expected that three shifts will be started. When completed, a depth of approximately 500 ft. will be attained. For the past 2 years, the Puzzle Leasing Co., operating through the Puzzle tunnel, has been developing the Gold Dust property. A shaft has been sunk a distance of 60 ft. from the Puzzle tunnel level and 1000 ft. of drifting has been done. The work has determined so far that lead-zinc ore shoots go down, and that former operators by no means exhausted the ore. On the level below the tunnel a large ore reserve has been blocked. On both the foot and hanging walls are lead-zinc streaks of good width, carrying values in gold and silver. From these streaks the shipping material has been taken. Between them lies a 20-ft. body of lower grade ore, which if determined intact at the depth to which the shaft will go, will furnish a milling proposition.

IDAHO.

Wallace.

The net profits of the Federal Mining Co. for the quarter ended July 31, 1916, were \$268,287, as compared with \$290,891 for the previous 3 months, according to the official report to stockholders, under date of Aug. 27. Shipments during the period were 38,972 tons, as against 31,844 for the first quarter of the current year, and the net earnings for the 6 months were \$624,029. Depreciation charges for the first quarter were \$65,234, and for the second quarter, \$64,006, and dividend payments to Oct. 1 were \$360,000. Shipments in February were 8558 tons; March, 10,627; April, 12,659; May, 13,707; June, 13,375, and in July, 11,890, while the net profits for the same periods, depreciation not deducted, were as follows: February, \$77,663; March, \$131,753; April, \$146,709; May, \$174,934; June, \$99,640, and July, \$57,719.

M. J. Sweeny, president of the Rex Con. Mining Co., which was organized a number of months ago to take over the old Rex mine and mill in the Nine-Mile district, and who also has been general manager since development was resumed at the property, has resigned the latter position, and Raymond Guyer, widely known mining engineer, has been chosen to succeed him. Guyer already has assumed his new duties, and President Sweeny will devote his entire attention to the executive affairs of the corporation. The Rex mill for a number of months was under lease to the Tamarack & Custer Mining Co., which last week bought the Frisco mill at Gem from the Federal Mining & Smelting Co. for \$150,000, and the Rex plant now is being remodeled, preparatory to

beginning treatment of the Rex output. The old workings of the Rex have been unwatered and repaired, and the property now is in excellent condition for active operations. The tramway is being rebuilt, and as soon as the buckets are installed shipments will be begun, probably not later than Oct. 1.

Mullan.

One of the most important strikes in the Coeur d'Alenes in several months was made recently in the Silverado mine, a mile from here, according to N. A. Carpenter, general manager, who says: "The discovery was made in an upraise from the lower tunnel, now in about 4000 ft. The ore is gray copper, carrying from 50 to 60 ozs. in silver, and undoubtedly is the best find ever made in the property. The exposure was made at a vertical depth of about 1400 ft., and the vein is from 6 to 9 ft. wide. We now are constructing a 100-ton mill, and the last of the machinery should arrive on the grounds not later than Oct. 1. It will require about a week to complete the plant after the delayed equipment reaches us, and we should be operating by the 15th. We also have agreed to handle the output of the Nellie mine, near the Silverado, in which recent development has demonstrated some very promising ore bodies."

Burke.

The net earnings of the Hecla Mining Co. were \$766,887 for the 6 months ended June 30, 1916, according to a report sent to stockholders, under date of Sept. 15. This is \$205,135 more than the net profits for the entire year 1915, and establishing a new high record of revenue for the corporation, but the achievement probably will be eclipsed in the last half of the current year, as the output of the property has been increased considerably in recent weeks to take advantage of the prevailing high prices of lead and silver. The company's surplus now is approximately \$550,000, and is being steadily increased from month to month. The financial statement for the period states that smelter receipts from shipments were \$1,079,211, and miscellaneous receipts were \$3376, making the total gross income \$1,082,587. Operating costs were \$291,285, and improvement costs were \$24,415, leaving the net profit \$766,887. Of this \$116,887 were transferred to the surplus account, and the dividend payments were \$650,000, as compared with \$565,000 in 1915. The Hecla mill now is treating 450 tons daily, but the directors have authorized construction of an additional 200 tons daily capacity unit, to be built as soon as plans can be prepared. The leased Union mill is handling 300 tons daily, operating two shifts, and probably will be continued in service after the addition to the Gem mill is completed.

LAKE SUPERIOR.

COPPER.

Houghton.

Victoria's new hoist is running and the skipway is practically completed. About 300 men are employed. The mill is treating about 400 to 500 tons a day. Eight new tables will be added, to raise the daily tonnage to about 700.

Ahmeek is finding that the neglected Kearsarge conglomerate is in both drifts in amazingly good rock. If this richness persists for a good length on the Ahmeek's ground it will pay all of the properties on the Kearsarge to crosscut to it at depth.

Superior's dividend is deemed the proper step, because it will have enough money left—probably about \$300,000—to develop a mine of its size.

Allouez will probably be a great gainer by the revival of interest in the seemingly forgotten Kearsarge conglomerate sometime in the future, as when No. 1 shaft was sunk this lode was met with at the top of the ledge, about 52 ft. from the surface, with a good width and a good disclosure of the metal. If the showing at the 10th level, about 1500 ft. down at the Ahmeek, continues, at some future date, when men are plentiful and conditions propitious, undoubtedly the Kearsarge conglomerate will be given an exploration at No. 1; No. 2 is too far west to intercept it. At the latter, however,

there is a recompense for the lack of the Kearsarge conglomerate, as at the depth of about 180 ft. from the surface the Osceola amygdaloid was traversed with a wide display of good quality.

Cass—the old Norwich—under the direction of D. L. L. Hubbard, is using drills, one above and the other below the first hole which reached the depth of over 1600 ft.; and the upper hole, that on the hanging-wall side, will begin next to the strata in which this original hole stopped, and the other will end in the strata next to those in which it began, so as to make a cross section of the formations, all three being at right angles practically to the series. One of the conglomerates of this part of the copper-bearing formations has been passed through, but is so far away from a point where the known members of the series can be accurately traced that it will not yet be identified until some other conglomerate is entered. Only small quantities of copper have been encountered.

White Pine Extension will discontinue sinking on the 230 level and will crosscut to the two sandstone and intervening shale or slate beds, in order to furnish rock for the experimental mill, where flotation will be employed for the first time in the Lake Superior district. The copper-bearing beds are about 40 ft. from the shaft.

Mass tonnage will run off slightly this month, owing to trouble with the rock crusher at "C" shaft, but it will be remedied in a few days, and the regular production will again be reached. The yield is holding up to about 16 lbs., as for some time in the past.

Keweenaw is entering the high-grade rock of the foot-wall side of the Ashbed lode at the 10th level, and the other two levels at the bottom of the shaft, the 12th and 14th, will be over very shortly. The 7th level east is in high-grade shot copper. On account of the great scarcity of carpenters and surface men the mill test will not be made until about the first of October.

Houghton has now a length of over 120 ft. on the northern drift at the 12th level of good grades almost all of the way. Only a little copper is being found on the 4th level, where drifts have been run for about 6 weeks. On the 6th level to the south a good grade is being stoped.

Franklin will soon be running two of its three stamps on its own rock; it is now using two stamps and a third part of the time. Each of the stamps can handle about 400 tons daily. There is no lessening in the values, as the levels are extended south and the 32nd is just about under No. 2 shaft. The capacity of the stamps can be greatly increased, probably up to 600 to 700 tons when it becomes necessary, by compounding them, which would mean with the changes and increases in the "wash" that would be required the expense of about \$50,000 a stamp.

Lake, at its shaft on the Knowlton lode, has unwatered down to the 3d level, and an examination is being made to ascertain the best points at which to begin the drifting. At its first shaft the lower levels are being stoped and are disclosing as good rock as found on those above.

Calumet & Hecla has for the time declined slightly in its daily tonnage to 9190 tons, which is one of those declines that occur occasionally from a combination of different causes, among which there stands out above the others, the lack of men. This, however, even for a year, would be a very good average.

IRON.

Quinnesec.

The St. Clair Exploration Co. will explore the McKenna property. It already has one diamond drill at work near the small creek. For many years the McKenna property has been considered one of the best prospects on the range and numerous parties have endeavored to secure an exploratory option on the same.

Duluth.

The strike on Mesabi range has been voted off. There were few idle mines when the vote was taken, most of the men having returned to their places some time ago. Some of the agitators have stated that the calling off of the strike

is merely a truce and that trouble will start again in the spring. Ore shipments were maintained during the trouble, more ore leaving the range this year than during any previous season. The strikers succeeded in closing some of the underground mines, but the pits worked steadily.

Ishpeming.

It is rumored that the C. & N. W. railroad will shortly commence a siding extending from the St. Lawrence track to the site of the marble quarries near the Ropes Gold mine. Much marble is now being shipped. In addition there would be the hauling of coal and other supplies to the quarry. The switch will leave the main line in the vicinity of Clowry, and be about 2 miles long. Railroad officials have been looking the ground over, and will probably start work in a short time.

MISSOURI-KANSAS.

Joplin.

With both ore markets showing stronger the outlook is better for mining conditions. Prices for medium and second-grade zinc ores advanced from \$5 to \$10, while prices for lead ores are reported from \$70 to \$75. This heavy advance in price naturally resulted in a large number of sales, and the week just ended will probably mark the heaviest shipments for many weeks. Producers who have been holding low and second grades accepted the opportunity to unload a large portion of their surplus stock, and the reduction that will result from this week's operations are expected to reach in excess of 3000 tons.

With the promise of lower powder cost, simultaneously with better ore prices, there is the likelihood of the opening of a number of properties which have been closed down and the re-employment of a large number of miners who have been thrown out of work.

F. E. Bryan and associates, operating a zinc prospect on Continental ground, west of Joplin, have ceased mining operations for zinc and are now opening up a pocket of coal at a depth of 60 ft. The shaft shows a 15-ft. face of coal, and so far a prospect drift has cut it 20 ft. The prospectors are taking out about 30 tons of coal per day and are marketing it.

Claude Perry is opening up the old Haggerty lease, southwest of Joplin, where a drill prospecting campaign showed ore at the 100 level. The shaft is now down 185 ft.

The Big Six Mining Co., operating on a lease of the Cunningham in South Joplin, has sunk a shaft to 110 ft. and is taking out a promising amount of lead ore. The drill prospecting showed ore from 117 to 138 ft.

On a lease of the City property southwest of Joplin the Adirondack Mining Co. is erecting a new 300-ton modern concentrating plant to be equipped with a gas and a Diesel oil engine. Two shafts are already down in the ore, and if it proves to be necessary, two to three more will be sunk. The company is conducting its operations at the 175 level, which is the one at which the disseminated hard ground ore deposits of the west Joplin field are found. W. H. Roberts is superintendent.

One of the richest old tracts in the Joplin field is the old Roaring Springs mine, directly south of the city, and the Swan Machinery Co. is now making preparations to drain this tract and resume operations at a lower level. At the present time all the operations are above 130 ft. Several companies are operating at shallower levels, nearly all of which show good possibilities. There is a 100-ton custom mill upon the ground which is taking care of the small production at the present time.

Walter Sandford and Cecil Brookshire have opened up a prospect on the Douglas land west of Joplin and at a depth of 73 ft. ore running from 6 to 12% is being taken out. For the present the ore is being cleaned in a custom mill in the vicinity, but with further development a mill is expected to be erected.

After an idleness covering several years, the old Bumble Bee mine, southeast of Joplin, is being reopened and a 150-ton concentrating plant is being erected. Three shafts are

now in ore, and a fourth is being sunk. A very large amount of lead ore is being found at the 150 level, and it is believed that when the mill is finished the ground will be amply open to supply the mill to capacity. M. D. Clark of Kansas City is the principal owner of the Bumble Bee Mining Co.

A. P. Clark, owning a large amount of land along Shoal creek, south of Joplin, reports a large number of new prospect holes put down, with the possibilities of an early production being made. This tract has always been a good producer, both of lead and silicate, the ore being found at shallow levels, from 30 to 70 ft. The ore is all cleaned on hand jigs, and is hand-picked, and the cost of production is low.

A. S. Baldry & Co. has opened up one of the richest silicate diggings in the Joplin camp for many months. In a shaft that was put down to increase the ventilation, a discovery was made from which 10 tons of silicate ore is now being taken per day. The ore was struck at 125 ft. and continues down to the 135 level. At 105 ft. a 10-ft. face of lead ore was penetrated which will be worked later.

The old story of quitting just a foot too soon was repeated this week when an old shaft which was sunk 12 years ago was reopened and work resumed. The shaft was sunk just 1 ft. further and a face of ore opened up which is believed to run 12% zinc. The new company took a lease and put down a drill hole, striking ore at 153 ft., which continued to 170. This prompted the cleaning out of the old shaft, which was found to be 152 ft. deep. The new operators are Wm. Kelley, Wm. Boyd, A. L. Moore, S. A. Smith, C. M. Ramsey, Geo. Ensing and Wm. Saylor, all of Joplin. The company is forming a new corporation, to be known as the Honey Bee Mining Co.

MONTANA.

Butte.

About 200 miners in Butte will receive certificates from the government for their work along mine rescue lines, according to S. J. Rahelly of the Bureau of Mines, who was here last week. These certificates are given only after the men have shown a certain degree of skill in the mine rescue work. Rahelly came here from Billings without the special car which is generally used. The car, which he has been using, has been condemned and he is without a "home" until the new cars, now under construction, are completed.

Articles of incorporation for the Boston-Montana Milling Co., with a capital stock of \$250,000, were filed in the office of the clerk and recorder last week. The company proposes to do a general smelting business. Stockholders in the corporation are: J. Ryan Gaul, Charles A. Blackburn, L. F. Benedict, C. M. McCoy, P. B. Goodwin, E. A. Law and Wyatt M. Fanie.

A large vein apexing in the Three Sphinx claim of the Rainbow Development Co., apparently strikes through the northern part of the property of the Butte & London Co. and it is for this fissure that the crosscut is being driven north on the 1600 level of the Butte & London. There also is a possibility that the Rainbow vein of Butte & Superior fame finds its way into the northern part of the Butte & London, particularly if the fissure curves to the south, providing that the fissure in the Three Sphinx is not the Rainbow vein, which fact has not been established to a certainty, the belief prevailing that the Three Sphinx possibly may be the eastern extension of that fissure. In any event a vein of large size is striking across the north end of the Butte & London. The Speculator vein of the North Butte is believed to strike across the southern part of the Butte & London, with the possibility that the vein may be found in a fraction bounding the Butte & London on the south, which has been acquired by the Butte & London from Arthur Cory and deeded to the Glendale Exploration Co., of which stock the Rainbow Co. is to be given 51% for its development of the Butte & London property. The 1600 crosscut will be extended south through the Cory fraction. Drifting will be started before long, it is expected, on a 7-ft. vein cut in the south crosscut, the ledge matter of which shows assays of 1½% copper and several

ounces of silver. Three or four veins have been cut on the 1600 level, all of which show the presence of copper in small amounts, but the walls of these fissures are strong with a filling apparently promising of developments with drifting. In the south crosscut one vein carried a foot of zinc ore which ran 9% zinc. If the developments on the 1600 level fail to come up to expectations, the shaft will be sunk an additional 500 ft.

The east and west vein carrying sulphide ore, cut several days ago in the Butte-Bullwhacker, has again been picked up by a crosscut driven from the old Stevens shaft, 50 ft. above the 100 level, where first it was found. The Stevens shaft is situated 200 ft. south of the Bullwhacker shaft. It was necessary to drive about 12 ft. to find the ledge. Where the vein was cut by the Stevens working it shows no sulphide ore, but there is about 2 ft. of high-grade oxide ore, an assay giving 23.46% copper. The drift on the 100 level of the sulphide vein has been driven about 30 ft., 15 ft. east and west from the crosscut opening the vein, showing a continuation of the sulphide body, the width of which ranges from about 1½ to 2 ft. In the east breast sulphide showing was 2 ft. in width, of fairly solid sulphide with an admixture of oxide ore, which will assay close to 40%, there being much altered glance in evidence. The unwatering of the Bullwhacker shaft to the 200 level will be undertaken and from that level a crosscut will be driven to the sulphide vein to determine its character at that depth. The Bullwhacker shaft has a depth of 400 ft.

Great Falls.

The new zinc refinery constructed by the Anaconda Copper Mining Co. here is now in operation. It has a capacity of 5,000,000 lbs. of refined zinc every month. The two new furnaces of 50 tons each in which the zinc is to go through the final process and be converted into plates for shipment were not ready and the first shipment of 25 tons was sent to Anaconda to be handled. The furnaces are expected to be ready for operation by Oct. 1. The entire plant will be in operation by Nov. 1.

Helena.

Many Montana pioneers will attend dedication of the monument which will mark the first discovery of gold in Montana at Gold Creek. It is expected that the monument will be in place about Oct. 20 and that the dedication exercises will be held Nov. 1. The marking of the spot will be in charge of the Montana Geographic society, although members of the Montana Society of Pioneers will take an active part. The monument will mark the exact spot at Gold Creek where Granville Stuart and his brother panned the first gold found in this state. It will be in view of both the Northern Pacific and Milwaukee railroad tracks and will be designated by Historian Frank D. Brown of the Montana Society of Pioneers, who has recently conferred with Granville Stuart, survivor of the discoverers. With Mr. Brown, President Jesse J. Rowe of the Montana Geographic Society and A. L. Stone of the University of Montana are in charge of arrangements for the dedication. Mr. Stuart will attend the dedication and it is very probable will make an address.

A custom mill to treat low-grade ores is to be reeted here by the New York & Montana Testing & Engineering Co., it is announced. The plant will cost \$30,000. It will aim especially to treat large bodies of low-grade ore in this mining district.

Drift 90 ft. east on the 500 level of the Scratch Gravel Gold Co. has opened 2 ft. of gold ore which assays from \$100 to \$200. The shaft is sunk on an incline and the 500 level is at a vertical depth from the surface of 300 ft. A stringer of ore 8 ins. wide was encountered 30 ft. from the shaft which has widened as the drift progressed eastward. Ore was found fairly continuous on the hanging wall of the shaft while it was being sunk. The values occur in a reddish iron gangue through which considerable sulphide is found in the character of iron pyrite. The picking up of ore east of the shaft is regarded as significant and as determining the dip of the ore shoot. In this direction the company has about half a mile on strike. On the upper levels the greater part of the higher grade ore mined has been found on the 200 level west of the shaft in the direction of the Franklin prop-

erty, the shaft of which is 1200 ft. westerly. Four cars of ore were shipped to the East Helena smelter during August and yielded \$14,000, which netted \$7000 on the month's operations. This ore was hoisted through a winze. From 15 to 20 more men will be placed at work Oct. 1 stoping, and upon the showing made in an upraise which it is proposed to drive from the 500 level will hinge the decision as to development on the 400 level, which has not been opened. Drifting will be continued indefinitely on the 500.

NEVADA.

Tonopah.

The Tonopah Western Con. Mining Co. has been formed with 1,000,000 shares to operate on 700 acres of ground lying between the Great Western and Tonopah Bonanza mines, and immediately to the east. The consolidation includes the Golden Gate, Desert King, Silver Queen, Comstock, Table Mountain and several fractional properties. The company has also arranged with the Greenwater Copper Mines & Smelter Co. for development of all the ground lying between the Great Western and Tonopah Bonanza shafts, which will mean exploration of nearly 1200 acres by the two corporations. The Great Western shaft will be deepened 300 ft. and crosscuts driven to connect with the Tonopah Bonanza workings a distance of 6000 ft. By this means much promising ground about 2 miles west of the Victor mine of the Tonopah Extension will be thoroughly explored. Boston and Montana people are heavily interested in the new company, including several officials of the East Butte Copper Co. The deal was consummated by Oscar A. Daube of New York. Robert H. Gross of Boston is president; F. W. Paine of Boston, vice-president; Oscar Rohn of Butte, secretary; W. Rooney of Boston, treasurer. Other directors are Oscar A. Daube of New York, Bryce W. Turner of Los Angeles, Frank Price and William Everts of Boston.

The Tonopah Extension is sinking the Victor shaft to a depth of 1800 ft. As soon as the level is gained a station will be cut and crosscuts extended to pick up the extensions of the Murray and other veins. Ore indications are becoming more encouraging in the eastern end of the 1260 and 1350 levels, where the drifts are seeking the eastern extension of the Murray vein, cut off by the Extension fault. From the main workings a heavy output is maintained and the mill is treating 2200 tons weekly.

Uncovering of high-grade silver ore in the Midway is claiming keen interest. The west drift that has been following the big ledge south of the new shaft has intersected a vein about 4 ft. wide, of which fully 2 ft. carries rich silver ore. Much of this is in the form of ruby silver and of beautiful character. The drift is being forced ahead to determine the extent of the discovery and the crosscut from the 1100 level is to be extended in hopes of picking up the shoot. The work is being done in virgin territory and promises to have an important bearing on the future of the district.

Rochester.

Connections between the Codd winze and the Friedman tunnel of the Rochester Mines will probably be made within 10 days. As soon as possible ore from the upper workings will be turned by means of chutes into the tunnel and from this point sent to the mill. The ore body above the Codd winze is being worked by the glory-hole method. It is 9 ft. wide and has been opened for 900 ft. In the Four J workings the vein shows 4 to 5 ft. of excellent ore.

The contact vein in Nevada Packard is developing well and a heavy tonnage is going to the mill. The ledge is stated to range from 20 to 30 ft. wide and averages around \$10, silver predominating. The mill is crushing 110 to 130 tons of ore daily, depending on hardness of material treated. J. W. Wilkey is superintendent.

Mina.

An examination of the Blue Light copper mine has been made by L. N. Ford of Washington, D. C., T. H. Flood of Tonopah and Prof. Jones of the University of Nevada, with a view to the feasibility of installing a 100-ton leaching plant.

The mine contains considerable ore and is owned by residents of Indianapolis.

Machinery for the mill on the Royal George mine, 20 miles east of Mina, has been received, and the plant is being rushed to completion. A large tonnage of good ore is exposed underground and on the dumps. San Francisco capital is interested. Fred J. Siebert is manager.

Battle Mountain.

The Goodwin-Plumas mine, 12 miles south of Battle Mountain, has been sold to E. N. Breitung & Co. of New York. The ore contains silver and some gold and an immense tonnage is stated to be exposed. A small force of miners has been put to work repairing the workings and getting things in shape for production. It is reported the company plans the erection of a mill with a capacity of 200 to 300 tons daily, and to operate the plant by electricity generated at Battle Mountain. H. B. Barling will be consulting engineer.

NEW MEXICO.

Silver City.

A. T. McGee Co., geologists, Ardmore, Okla., has taken an option on 50,000 acres of land in the Animas valley, southern Grant county, and are preparing to prospect for oil. They will also option a tract of land which is said to be rich in lead and zinc.

Fierro.

John Brockman, Los Angeles, and J. W. Brock, a capitalist of Philadelphia, owners of the iron mines at Fierro, announce that a mill of 400 tons capacity will be built at once for the purpose of handling the copper-iron deposits of the district. The preliminary work has been started under Superintendent B. E. McKechnier and it is expected the mill will be built with as little delay as possible. Fierro has been known as an iron camp, but certain of these ores contain copper which makes their treatment for the extraction of that metal an attractive proposition, when a complete saving of the iron content can be made. While the mill will be of 400 tons capacity to start it is to be constructed so that the capacity can be increased.

Mogollon.

High-grade ore was discovered last week in face of No. 3 tunnel on the Eureka claim. The owner, D. E. Bearup, has already shipped a considerable tonnage from upper workings and this new strike adds materially to ore reserves. First-grade is being sacked for consignment to El Paso smelter direct, while second-class will be treated in local custom works.

Mogollon Mines Co. output for first half of September was 1300 lbs gold and silver bullion and 3 tons high-grade concentrates, from a reduction of 2025 tons of ore. Station at 900 level in new shaft is being cut and will be finished this week, when sinking will be continued.

At Pacific mine a large crew of carpenters are rushing work on loading station and terminal for aerial wire rope tramway to plant of Socorro Mining & Milling Co., at which latter point the terminal is practically completed. Mine development is being pushed night and day and the property will be in shape for supplying tramway with a regular tonnage for a long period.

The Eberle mine has been explored with a total of 600 ft. of sinking and raising and 1450 ft. of drifting. Both Queen and Deep Down veins run lengthwise through property, the Queen with a width of 4 to 18 ft. The Oaks Co.'s operations have been confined largely to latter vein and a good tonnage of mill ore is opened up. Ore was shipped by this company during development period, with a value exceeding \$2000 per ton. No stoping has been done in the mine.

A 1% dividend was paid Sept. 1 by Socorro Mining & Milling Co., the fifth of like amount this year.

Steeplerock.

A second payment, \$40,000, has been made on the Carlisle mine, sold some months ago by George H. Utter, Silver City, to eastern capitalists. This is the second payment made, the total purchase price having been approximately \$300,000.

OREGON.

Granite.

The United Gold Mining Co. has about 20 men on its pay roll, and when in full operation this number will be more than doubled.

Sumpter.

Otto L. Simons has brought suit against C. L. Arzeno to recover the sum of \$1225 with interest on portions of it from varying dates, on which payments were alleged to have been made under an agreement between them, and the further sum of \$1250. The complaint alleges that the plaintiff transferred his lease on the Imperial mine to the defendant under an agreement, terms of which have not been fulfilled by the defendant.

SOUTH DAKOTA.

Deadwood.

The Slavonian mine is shipping at the rate of 75 tons per day to the Deadwood-Standard mill and it is rumored this amount will be increased to the mill's capacity of between 200 and 300 tons. When the Deadwood-Standard plant was in operation, there was some trouble in the winter in keeping up its efficiency, and freeze-ups were frequent, owing to the construction of the housing. The present lessees of the plant propose to remedy this defect and a force of carpenters are now engaged in making improvements on the building. From this work it is evident that it is the intention of the lessees of the Slavonian ground to continue operations during the winter months. It is also rumored that custom ores may be treated at the mill later.

Custer City.

Good ore has been encountered at the Monarch mine. In one of the drifts from the main tunnel a shoot carrying free gold has been struck. This streak is not very extensive, so the rich stuff is separated and will be sacked. They have about ½ ton of this ore sacked, while on the dump is from 10 to 15 tons of material which will assay high, and which will be shipped soon for treatment. The shoot which has been opened up in one of the old drifts, a considerable distance in from the portal of the main tunnel, is said to be extensive and easily mined, and will average better than \$20. It is expected that a carload of ore will be sent away to a treatment plant by Oct. 2.

Keystone.

The Holy-Terror-Keystone-Bullion deal is progressing favorably, L. D. Huntoon of New York, in charge here, represents the Sheldon-Morgan interests, who are back of the undertaking. A most thorough sampling of the Bullion ore bodies are now under way, 14 men are employed and will be kept at work extending drifts and crosscuts on the ore body, that a complete knowledge of the estimated values may be had. The accurate and exhaustive system employed in sampling are in keeping with the magnitude and fully equal to requirements to those familiar with production and values of the Bullion in the past. The outcome is awaited with interest and confidence expressed that the dependable methods in operation will produce reliable and satisfactory results.

Continued development of the Columbia ledge on the 200 level gives proof of its extent and richness. Specimen ore is of common occurrence. Quite recently in the progress of the work ore rich in free gold was uncovered, and results so far have confirmed expectations in the permanency of the ledge and its high-grade values. Preparations are complete, and it is expected that development will continue with the sinking of the shaft to the 300; the ledge opened up there, its extent and value determined, after which it is considered likely that measures will be taken to adapt methods and processes for the handling and treatment of the ore and placing the property in line as a steady and paying producer.

One of the most promising properties here is about to come into its own. Some time ago Denver people formed the Good Hope Mining Co., taking over the Liston-Tenny

ground. The management, composed of practical mining men, were impressed with the showing disclosed by work of the former owners and set about to extend development and verify values. After months of systematic work results have justified the effort in a most gratifying way. A shaft already started on the outcrop of a gold-bearing ledge was continued on down, finding the ore in place and averaging a high grade. A mill had previously been erected on the property and a run was made on the ore mined in developing. The mill run was in the nature of a "tryout" by the management, and the result is best gauged by the cleanup made from the mixed unsorted rock ran through. Extensive preparations are now being made to install necessary and up to date equipment on mine and in mill. A force of men will be added, a road graded to top of the hill, where the shaft is situated; a steam hoist will be set up, the efficiency of the mill increased by addition of concentrators, a new air compressor installed, sinking the shaft will be resumed, and from time to time mill runs will be made on the ore encountered, in that way helping to defray expenses and enabling the management to experiment and apply correct methods of treatment, when contemplated development has reached a stage that will determine the erection of a suitable and permanent plant for reduction of the ore.

The Cuyahoga Mining camp presents a busy scene these days, a new "dry" and storehouse, together with a finely equipped blacksmith and machine shop is nearing completion, two new boilers lately received are being moved and will be added to the equipment at the mine where 40 men are kept busy pushing work. The raise from the shaft at tunnel level, through to the surface has been finished, a road graded for the ore teams, and shipments of the sulphide ore found in sinking will be resumed. A trial carload shipment sent forward some time ago brought satisfactory returns, and an insistent demand for the product, of which the mine appears to have an immense quantity.

The old Spokane mine will again come to the front as a producer, a company known as the Keystone Gold & Lead Mining Co., having bought the property, and are busy getting things in shape to work the mine, fitting up with sufficient boiler power, a hoist and air compressor. Shipments of the high grade gold, silver, lead and zinc ores will be loaded on cars here and sent to outside smelters for treatment, while the company are arranging to build a suitable plant at the mine for treatment of the mine run ores.

The Dr. Herman Rienbold's properties continue to be worked for amblygonite, mica, and the various rare minerals encountered as work proceeds. Eight men are engaged mining, saving, sorting and preparing the product for shipment.

Pat O'Keefe employs 3 men and with a horse whim in operation has kept steadily at work since early in the season, developing the ore body in the N. Pope mine, one of the claims composing the well known Egyptian group.

UTAH.

Cottonwood.

No. 4 drill hole at the Emma now shows 21 ft. of ore and in reviewing operations Geologist Beeson reported: "We have encountered high-grade silver-bearing lead ore in hole No. 4 at a depth of slightly over 210 ft. below the Bay City tunnel level, at a point about 140 ft. northeast of the Montezuma fault. In three previous holes at a depth of 180 ft. we encountered favorable conditions. In hole No. 2, for instance, a ½-in. streak of galena and quartz was cut below a brecciated zone, and where we have the ore is on a line with this horizon, the additional depth apparently being due to the inclination of the strata. The holes so far put down are arranged radially with No. 4, or the last one as a center. No. 1 is situated 80 ft. to the southwest. No. 2 is 80 ft. to the south, and No. 3 80 ft. to the southeast. I am satisfied that the ore encountered is a continuation of the famous Old Emma ore body. This is borne out by the fact that in each of the holes at this same horizon favorable indications have been met with, and, further, because hole No. 3

showed conditions almost identical with those seen in the limestone exposures just south of the Old Emma stope near the surface. In further explanation, it may be said that at the surface there are certain distinctive geological characteristics in the way of mineralization and texture of the limestone beds lying adjacent to the ore bodies in the foot-wall side of the fault that we find duplicated in the faulted portion of the limestone below the Bay City tunnel level on the hanging wall side of the fault. This increased our confidence in the successful outcome of the operations which we were carrying out. The ore encountered in the drill hole is somewhat different in character to that which was mined in the Old Emma stope, because, in the upper workings, the ore was almost completely oxidized, while the ore cut in the drill hole shows no oxidation or alteration whatsoever. Further, it is much more silicious. The core shows galena and pyrite disseminated through a compact mass of quartz, with here and there small cavities lined with well formed crystals of quartz and galena. Argentine, the sulphide of silver, is also present. This is further evidenced by the high silver values contained in the first part of the core which was sent to be assayed. The unoxidized nature of the ore and the apparent absence of secondary minerals and the large amount of quartz in the gangue, leads to the conclusion that the high-grade ore encountered will persist to depth. The character of the quartz as shown in the core indicates that the mineralization has been affected by deep-seated solutions coming up through fissures in the rocks and replacing the limestone. It could not possibly have come from waters infiltrating from the surface. In hole No. 2, 80 ft. away, the ½ in. of galena is evidently connected with the body cut in hole No. 4, as was intimated at the time hole No. 2 was put down."

American Fork.

In speaking of this camp J. D. Blue says: "This is the busiest camp I have seen. At the Pacific a rich mine is being opened up and ore is being shipped. At the Dutchman flat this same property is building a 65-ton mill which will be ready in a short time. At the Bay State conditions are looking good for the opening of the ore body in the lower level which may take place at any time. The Whirlwind is doing some quick work in driving its tunnel but as yet there has been nothing of interest developed. The Dutchman is going ahead on its development of the old property. The tunnel has been cleaned out and the old workings are being put in shape. In Mary Elle Gulch there is considerable effective work being carried on. The Belerophan property is taking out lead-silver ore from what was believed to be a bedding plane 40 ft. above the tunnel level. This is apparently a cross fissure and is showing considerable high grade ore that is being mined. Further up the canyon on the Live Yankee grounds is the Green Leasing Co., belonging to Herman H. Green, city commissioner and associates. Here they have about 12 tons of ore on the dump. Over the hill from this is the Earl Eagle ground. It has the only power equipment in the camp. All the other properties are working by hand. Although the property is still in the prospect stage it is the most likely ground in the camp. The lime bed is the thickest I found there and this is cut by a series of fissures that but a few thousand feet away made ore and why they should not make ore again in the lime I do not know. The tunnel is now in something like 400 ft. and already has cut one small porphyry fissure. This is encountered at right angles and carries out the idea of what these parallel fissures would do. Within the next few hundred feet it is expected that the Miller fissure will be encountered which should show an ore body."

Bingham.

With all of its lead product contracted for at 7½ cts. into November the Utah Metal & Tunnel Co. is continuing to develop more ground. A crosscut from the big tunnel is now within 700 to 800 ft. of the Last Chance line. It has encountered many fissures, and is directly through the region where the strongest fissures of Bingham region, as Nast, Burning Moscow and others, outcrop on the surface. This development is only a small part of what is being carried on in other sections of the Utah Metal and Bingham-New Haven which has crosscut under the Malloy Bedding.

From this place a large part of its product in years past has been derived, 300 ft. below present workings, giving that quantity of backs for future work; and similar development under the Stoddard Bedding gives 500 feet of backs for that ground. The two properties have been for a long time connected with the tunnel for transportation at the 4th level of the New Haven, and at the 7½ level, 300 ft. below, a drift which was begun some months ago, to get under the large bodies uncovered last year, has reached this region and is in richly mineralized ground; and raising to the location of these bodies. Crosscutting to the south is also well under way and being pushed with results. The drift at the 7½ level is also being extended to get under the big iron cap which is supposed to cover a large copper deposit and which was developed in boring the Jeff Davis tunnel. The old 102 drift, which was 75 ft. above the big tunnel in the Utah Metal, has over 10 large stopes from which both mill and shipping ore is being taken out.

The capacity of the mill is at present 225 tons. It is announced that the flotation process will be completed and in operation immediately following Sept. 20 and should result in saving not less than \$6,000 per month. The outstanding bonds of the company are now about \$230,000 and there is no other indebtedness. The cash position of the company is still strong and its cash accumulation is increasing.

Eureka.

Allen and Duncan have received the contract for sinking the Sioux Con. shaft. They are retimbering a part of the shaft, which is down 600 ft. and getting things in readiness for sinking. Under their contract the shaft will be sent down to the 1000 ft. level and it is barely possible that sinking will not stop short of the 1200. Work is to be continued in the winze which is being sent down in an effort to locate the extension of the Iron Blossom's deposit. This winze is located on the 600 level and it is not more than a few hundred feet from that part of the Iron Blossom in which the copper ore was recently discovered. Three shifts will be used in the shaft and work in the winze will also be carried along without interruption as soon as a small electric hoisting plant can be installed.

Electrification at the Grand Central mine is being contemplated. Equipment similar to that in use at the Eagle & Blue Bell will probably be secured. The electrification of the hoisting engine should be simple, but the present compressor will no doubt have to be replaced by a more modern machine. A compressor with a capacity of 1000 ft. of free air per minute would be about right to meet the mine's present needs and by putting in a second unit of about the same size the compressor capacity could quite easily be brought up to the proper point in the event a mill is constructed for the treatment of the mine's low grade ores. At present there seems to be a likelihood of such a plant being built. Where electricity has replaced the steam power expenses of hoisting and the operation of machine drills have been cut in two in some cases. Shipments are heavier than they have been in many months. The present output amount to about 2 carloads, or 100 tons, daily.

WASHINGTON.

Republic.

The highly siliceous ores of this district are in great demand now by the smelters at British Columbia points. That statement is made by Manager Richardson of the Knob Hill mine, who further says: "The Grand Forks and Trail smelters are the principal consumers right now, though earlier in the season the Greenwood plant took a lot of our ore and the Northport smelter has recently taken the entire output of the Lone Pine-Surprise group, which it now owns and operates. The reason that the Granby plant is taking so much siliceous ore of late is that the Anyox smelter of that company is shipping its matte to the Grand Forks plant to be converted into blister copper. The Knob Hill mine sent 14 cars to Grand Forks and 2 to Trail in August. So far this month we have marketed 6 cars at Grand Forks and 2 at Trail and

shall send the most of our output for the balance of this month to the latter plant. The Moye Leasing Co., operating the Hope Co.'s Blacktail mine since last June, of which I am also manager, has shipped 33 cars to date. Twenty of them went to Greenwood, but the present output, at the rate of 10 cars monthly, is going to Grand Forks. The old Republic mine has resumed operations of late and is shipping a few cars from time to time."

Omak.

The silver-lead strike on Pogue mountain made by E. C. Sherman, Republic, and A. J. Krøjberg, Omak, is attracting much attention. Rich surface ore is being taken from the ledge. Only a few feet of depth has been attained, but the owners have almost enough sorted ore to make a carload.

According to President Bilrowe of the Bilrowe Alloys Co., Tacoma, his firm will start to construct a mill at its manganese mine by Oct. 15. The property has been making regular shipments of 2 cars a week for some time and the mill will give facilities for handling the low-grade rock that is now unprofitable.

Northport.

Samuel James, manager of the Northport smelter, says: "Two more furnaces, which will double our capacity, will be blown in at the smelter by Oct. 2. After they get in operation we will be able to make such an output that they will not so easily swamp us with ore as they have been doing of late. All the problems of treatment and supply have now been worked out and a crew broken in, so it will be plain sailing from now on. Ores and fluxes of all kinds are being furnished in ample quantities. The only material wanted now is coke. Our supply comes normally from the Crow's Nest Pass field, but labor troubles in that section have compelled us to draw our supplies of fuel from the east temporarily. We understand the British Columbia mines are now in position to furnish us with coke regularly and in ample quantities."

WISCONSIN-ILLINOIS.

Highland.

Shipments from this district last week came exclusively from the mines of the New Jersey Zinc Co., 8 cars of carbonate zinc ore, 225 tons, delivered to the furnaces of the company at Mineral Point. Operations were resumed this week at the Red Jacket mine. Saxe-Lampe Mining Co. is opening up new ground and reports a fine showing.

Benton.

The Frontier Mining Co. is employing 400 men. Regular monthly dividends of 2% are paid, the last being Sept. 1. In addition to the Bull Moose, Hird & Calvert zinc are producers, another mine has been developed on the south side of the Grotkin lease, on which is located the Bull Moose. A new 200-ton equipment is being provided, the main power and milling plant being already under roof. Drills are constantly engaged and with good results, a fair showing being reported on the James Calvert allotment; a fair-sized deposit has been drilled out on the Schultz land; on the W. Calvert tract, checking on the range has been completed, and extensions are shown on the west side of the lease; on the Hughlett, nearer to Galena, two out of three borings have resulted successfully. The Calvert mine has an output of 200 tons of concentrates weekly. The new deposits here proven have been connected with the old Calvert mine. General Manager J. H. Billingsley anticipates this range extending into the Robson farm north of the old Frontier mine, about 800 ft., and towards Swindler's ridge, making the fourth basin found in close proximity to the original deposit on the Frontier mine, and from which dividends have been paid for the past 8 years. The Bull Moose is making 200 tons of 42% weekly. The range trending southeast is very strong, and a new power and concentrating plant is going in here. The mill is 1000 ft. southeast of the Bull Moose plant. On the Hird mine two big runs of sphalerite have been proven. Cuttings from drill run 12 to 15% mill ore in the rock, and unusually high grade. Efforts have been made to connect up with the pres-

ent mine, and officials declare they have the task covered. This means a long run for the Hird of good grade.

The Burr Mining Co., operating the Treganza mine, is making 160 tons weekly of 45% concentrates. The main owners are officials of the Frontier Mining Co. The lease has not been fully explored as yet, except sufficiently to warrant a year's high run.

Shipments of zinc ore for week of 23rd aggregated 73 cars, 2967 tons. The Benton Roasters shipped 6 cars in addition to fine separator pyrites, 264 tons. Vinegar Hill Co. led the way with 15 cars to Cuba; New Jersey Zinc Co., 12 cars to Mineral Point for refining; Frontier Mining Co. to Grasselli Chemical Co., 7 cars, 290 tons; Fields Mining & Milling Co. to Grassellis, 5 cars, 205 tons; to Galena Refining Co., 3 cars, 104 tons; Champion mine to separators 12 cars, 490 tons; Grand View to Cuba, 37 tons; Sally Mining Co. to Galena, 86 tons; Benton Roasters, to La Salle, 40 tons, and to Collinsville, 4 cars, 160 tons; Wisconsin Zinc Co. to LaSalle, 40 tons; American Zinc Co., 4 cars, 160 tons; to Collinsville (Eagle-Picher) 6 cars, 380 tons.

Miffin.

Improvement is shown here recently in the marketing of ore, the Coker mines shipping 9 cars to Mineral Point, 363 tons; Lucky Six to Grasselli Chemical Co. under a new contract agreement, 3 cars, 129 tons; Biddick mine to Benton Roasters, 2 cars, 81 tons; Peacock Mining Co. to American Metals Co. under contract, 2 cars, 87 tons. A new producer has been set in motion on the Big Tom mine for the M. & A. Mining Co. Mill building is progressing rapidly for the Vinegar Hill Zinc Co. on the Yewdall lease. Mineral Point locals delivered small lots to furnace, 24 tons in all.

Platteville.

Reports from all districts for week ending 23rd continue activity shown for weeks, 167 cars of zinc ore going to track, 6774 tons; 4 cars of lead ore cleared, 174 tons. Shipments of pyrites were 1283 tons. The gross recovery mine-run stuff for the week exceeded 11,000,000 lbs., while net deliveries to smelter aggregated 6,582,000, nearly all high-grade refinery ore.

A gain of \$2 was made during the week on the price of the standard and top grades of zinc ore, the base ruling at \$58, ranging down to \$50 for medium grades. Low grade ores, however, were in poor demand, and the reserve in the field is held at 7000 tons.

Cuba City.

National Separating Co. is again receiving ore from Vinegar Hill mines, last week up to 18 cars, 752 tons. Shipments of finished product were evenly divided between Illinois Zinc Co. and Granby Com., 4 cars each. Utt-Thorne Co. shipped one car to Benton for treatment. This company will build a new plant to replace the one destroyed by fire recently.

Mineral Point.

Receipts of ore at the refineries of the Mineral Point Zinc Co. continue heavy, last week 39 cars being received, 1412 tons. With the exception of 3 cars this ore all came from company mines in the field. Shipment was made to DePue of high-grade finished product, 19 cars, 735 tons. Shipment was made also of 301 tons of iron pyrites to Prime Western Smelting Co. National Separators at Cuba shipped 193 tons; Federal Lead Co. secured 1 car of lead ore from each of the following mines: Rodhams, Cleveland, Utt-Thorne and Blackstone. Bids ran up \$70 and better.

Hazel Green.

The Kennedy mine holds its reputation as a zinc ore producer, again reporting out 4 cars to Mineral Point, 121 tons; Cleveland mine shipped 3 cars to Grassellis, 120 tons and 1 to Linden Zinc Co., 40 tons; Lawrence mine of the Cleveland combination to Wisconsin Zinc Co. at Galena for separator treatment, 5 cars, 210 tons.

Galena.

Continued improvement in the volume of ore marketed from this district is being shown. Black-Jack mine, 4 cars to Mineral Point, 124 tons Galena; Refinery Co. to Lanyon Zinc Co., 42 tons, and to Edgar Zinc Co., 48 tons; Federal mine, Wm. F. Weber, Jr. in charge, to Wisconsin Zinc Co., 4 cars, 163 tons; Little Corporal to Mineral Point, 45 tons; Graham to Cuba, 43 tons; North Unity, 87 tons; Wisconsin

Zinc Co. to M. & H. Zinc Co., at La Salle, 4 cars premium-grade jack, 160 tons. The Joplin Separators of the Wisconsin Zinc Co. shipped 437 tons of pyrites to Grasselli Chemical Co.

Potosi.

Wilson Mining Co. shipped 1 car high-grade concentrates last week to La Salle, 45 tons. Tiffany Zinc Co. filed articles of incorporation with the Secretary of State on the 19th; capital stock 500 shares of the par value of \$100 and held principally by E. W. Wagner of 208 W. Van Buren St., Chicago; \$25,000 has been paid in for development and equipment. Supt. Patterson is in charge of the local office.

WYOMING.

Rawlins.

Among the fields in which drilling now is in progress, and in some of which hundreds of wells have been put down, are the Little Horse Creek, Brenning Basin, Big Muddy, Salt Creek, Lost Soldier, Big Piney, Pilot Butte, Sage Creek, Grass Creek, Basin, Torchlight, Thermopolis, Greybull, Cody, Elk Basin, Lovell, Frannie, Dutton Basin, Sundance, Lost Cabin, Ervay, Sheridan, Little Buffalo Basin, Wheatland and Alkali Butte. It is estimated that the production for 1916 will exceed 7,000,000 bbls.

James Brunton, Los Angeles, Calif., states that oil has been found in this vicinity. The oil is similar to that found at Greybull about 160 miles north—a paraffin base light greenish oil, testing about 50 gravity. The strike made is at a depth of between 500 and 600 ft. I have obtained land and installed one rig for a test well. Rawlins is on the main line of the Union Pacific, about 75 miles southwest of Casper. The wells I drilled at Greybull which came in good for several hundred barrels daily have fallen off to about 10 barrels, but the value of the oil renders this rate of production still profitable.

CANADA.

BRITISH COLUMBIA.

The Granby Con. Mining, Smelting & Power Co. on Nov. 1 will pay the regular quarterly dividend of \$2 a share, or \$299,970 to stockholders of record Oct. 14. This will make the payments for the current year \$1,049,894 and will increase the grand total to \$6,776,817. The Granby Co. now is producing about 4,000,000 lbs. of blister copper monthly at its two smelters, and information received from sources closely in touch with the management states that there is on hand in New York enough unsold copper and gold to retire the corporation's outstanding bonds, besides retiring all other claims.

W. P. Hopstetter has been appointed manager of the Pathfinder mine and will start development at once. Bins will be built at the mine and also at the K. V. R. tracks. The roads will be improved and it is expected that the Pathfinder will be shipping about 30 tons daily to Granby smelter soon. The ore runs about 2% copper and \$2 in gold.

Windermere.

By extending the Kootenay Central branch of the C. P. railroad to this district some of the old mines such as the Silver Belt and Nettie M., will start shipping. The Paradise mine, which was abandoned some 10 years ago on this account, made its first shipment Sept. 5 to the smelter at Trail. Eight heavy teams are engaged in hauling from the mine to the railway and this number will be increased. The mine is employing 21 men and arrangements are being completed to increase this number to 30 for the winter. A short aerial tramway is being constructed to carry the ore from the mine to storage bins which have been built. Suitable shipping facilities are being arranged for on the line of the Kootenay Central. The property is owned by the estate of the late Herbert Carlyle Hammond. The ore is silver-lead and will be shipped continuously all winter. This property

in old days shipped 2000 tons to Trail. At that time the ore had to be brought to the water's edge and shipped down the Columbia river by boat to Golden, where it was transferred by team to rail; thence by rail to Revelstoke and Arrowhead, where it was transferred to boat and taken to West Robson, when it again had to be transferred to rail and shipped to Trail. It was this high cost of transportation which caused the owners to stop operations.

Kaslo.

Middlings from the Lucky Jim are now being treated here and an additional \$5000 of the mortgage on the Lucky Jim mine, held by Lendrum McMeans, Winnipeg, has been paid by A. G. Larson, receiver. The total paid since the court placed the mine in Mr. Larson's hands is now \$32,500 and \$10,000 more remains to be paid. In August 150 tons of zinc concentrates and 75 tons of silver-lead ore were shipped. The estimated value was \$8646.35. In addition 80 tons of zinc concentrates were produced but were not sent to the smelter on account of an embargo placed on zinc ore shipments by American smelters. The Kaslo zinc treatment is now in operation as far as the magnetic separator goes and good results are being attained by the treatment of Lucky Jim middlings from the Rosebery mill. On account of their high iron contents these middlings could not be shipped profitably to United States smelters and about 1000 tons have been stacked up at Rosebery, awaiting completion of the Kaslo plant. The concentrator portion of the plant is expected to be in operation soon. The mill will have a capacity of about 500 tons of concentrates a month. During August a cross-cut was driven and a raise put through at the Lucky Jim to connect with the main working stopes and this has facilitated the handling of ore. Total expenditures in the month were \$7634.94.

Ainsworth.

The crosscut at the Coffee mine has been driven in about 130 ft. It is estimated that it must be driven a total length of 300 to 400 ft. before it hits the vein at a depth of probably 400 ft. Twelve men are employed. W. Yolen Williams is consulting engineer for the property.

Hedley.

On Sept. 13 the directors of the Hedley Gold Mining Co. at a meeting in New York declared the regular quarterly dividend of 3%, or \$36,000, and a special dividend of 2%, or \$24,000, payable Sept. 30 to stockholders of record Sept. 23. This will make the total disbursement \$60,000, or 5% of the issued capitalization of 120,000 shares at \$10 each, and will make \$180,000 distributed to stockholders in 1916, increasing the grand total to \$2,003,520. The Hedley Co.'s authorized capitalization is 150,000 shares at \$10 each, but 30,000 shares still are in the treasury. The corporation is organized under the laws of Delaware, but the principal offices are maintained at 42 Broadway, New York. The holdings comprise several groups near Hedley, but the only producing property is the Nickel Plate mine. The product is chiefly gold, although the ore carries a small amount of silver. The net earnings in 1915 were \$374,745, and the surplus on Jan. 1, 1916, was \$435,070, of which \$360,325 was carried over from 1914. The output of the property in 1915 was 74,265 tons, all of which was milled, and the total recovery was \$796,592. Operating expenses were \$421,846, including \$38,938 expended perfecting the new hydro-electric plant and in betterments to other equipment and the camp buildings. The hydro-electric station, commissioned Jan. 2, 1915, at a cost of \$192,000, or \$8000 less than the estimated price, is on the Similkameen river, just below the mouth of Twenty-Mile creek, and furnishes power to operate the 40-stamp mill and the mine machinery, as well as current to illuminate the camp and the undergrounds. Development has indicated that the general average value of the ore will be \$10 to \$11, according to a recent report from President I. L. Merrill. The increasing baseness of the product with depth, which increases the concentrates tonnage and reduces the grade, has necessitated a change in the treatment system, and a straight cyanidation system is being installed. The ore reserve is estimated at 423,522 tons, averaging \$10.39. Of this 35,025 tons, rated at \$8.52, are in the old workings above the No. 4 tunnel, and below that are 388,527 tons averaging \$10.55, including 75,000 tons of \$11 ore below the 800 level.

ONTARIO.

Cobalt.

Test pits are being excavated on the Hanson vein at the Newray mine and one is now down 50 ft. which shows good ore. Another one of similar depth will be started on the same vein at another point some distance away. The results of the work on this vein are encouraging. In the process of sinking a considerable body of ore was put in sight showing free gold. The shafts being put down, however, are only for testing. If the work proves up a large body, as present indications appear to indicate, development will be continued from one of the lower levels. The present plan is to continue surface work until the winter and then crosscut. This will give access to a number of parallel veins, the farthest of which is not more than 700 ft. from the shaft. The shaft is down 425 ft. and is well timbered, and provided with stations at 200, 300 and 400 ft. The company is diamond drilling with a view of picking up the original vein lost in faulting.

At the Gifford the shaft is down 288 ft. and the contact vein left the shaft at a depth of 65 ft. in the winze from the 200 level. Sinking will be continued to the contact and the vein will be picked up again by crosscutting. A mud vein and also a calcite stringer cut through the shaft in the progress of sinking. The mud vein is an entirely new one and is about 3 ft. wide.

Beaver Con. in its report for the quarter ended Sept. 1 says: "A great deal of general work has been done on the upper levels, from all of which we have been recovering ore. On the 400 and 460 we have made one or two discoveries of high-grade. We have demonstrated that we have reached the lower contact, and it now remains to thoroughly prospect this ground to determine the values. The cage is dropping to the 1600 level and all operations organized for the development of the lower contact. Up to the present time we have done 96 ft. of crosscutting east of the station, encountering two stringers. These are similar in character to those cut above the diabase sill. One hundred and forty-six feet of crosscutting has been accomplished west of the station. Our experiments with the oil flotation process have not reached the point where we consider it advisable to install a plant. While we have 360 acres under option from the Kirkland Gold Mining Co., all our work has been confined to what is known as the McKane claim. The shaft has reached a depth of 288 ft. On the 100 level, 191 ft. of drifting has been done on a vein 4 ft. wide, which gave us an average value of \$15. Four hundred and ten feet of drifting and crosscutting was done on the 200 level, but the results were not satisfactory, consequently the shaft was continued to the present depth, the station cut, and 19 ft. south of the station we encountered a vein about 5 ft. wide, channel assays from which average \$11. Continuing the crosscut, we went through 10 ft. of porphyry, assays from which average \$7, and encountered another vein running parallel with the first vein. The second vein is 12 ft. wide, channel assays from which give an average of \$12.80. Visible gold shows all through this second vein. This is an important discovery, and we shall immediately sink the shaft to the 400 level to ascertain if these values continue."

Timmins.

The concrete foundations for the new Hollinger mill, which will have a 1600-ton capacity, are nearly completed. The superstructure will be built this coming winter and the machinery, which will include 100 stamps and 10 tube mills, will then be installed. It is expected that the new addition will be running by June, 1917. The new central shaft plant, with its 5000-ton crusher, will be completed by March 1, 1917. This latter plant will represent an investment of about \$750,000. Underground the company is connecting up all the workings of the Consolidated properties on the 425 level. One connection to the workings near the Vipond is 2600 ft. long. The present mill is handling about 1900 tons a day, 40% of which is coming from the Acme. It is calculated that even with the new mill bringing the total milling capacity up to 3500 tons it will be 2 years before all the ore is broken down and milled above the 425 level and 7 years before the Hollinger begins taking ore from the 1250 level, according to estimates.

World's Index of Current Literature

A Weekly Classified Index to Current Periodical and other Literature, Appearing the World Over Relative to Mining, Mining Engineering, Metallurgy and Related Industries, in Four Parts.

Part 1. *Geology*—(a) Geology; (b) Ore Genesis; (c) Mineralogy.

Part 2. *Ores and Metals*—(a) Metals and Metal Ores; (b) Non-Metals.

Part 3. *Technology*—(a) Mines and Mining; (b) Mill and Milling; (c) Chemistry and Assaying; (d) Metallurgy; (e) Power and Machinery.

Part 4. *General Miscellany* (including Testing, Metallography, Waste, Law, Legislation, Taxation, Conservation, Government Ownership, History, Mining Schools and Societies, Financial, etc.

Articles mentioned will be supplied to subscribers of *Mining and Engineering World* and others at the prices quoted. Two-cent stamps will be received for amounts under

\$1. Subscribers will be allowed a discount of 5 cts. if the price of the article exceeds 50 cts. The entries show:

(1) The author of the article.

(2) A dash if the name is not apparent.

(3) The title, in italics, of the article or book. Titles in foreign languages are ordinarily followed by a translation or explanation in English.

(4) When the original title is insufficient a brief amplification is added. This addition is in brackets.

(5) The journal in which the article appeared; also the date of issue, and the page on which the article begins.

(6) Number of pages. Illustrated articles are indicated by an asterisk (*).

(7) The price.

Cubillo, Leandro.—*La Industria Siderurgica Espanola*. [On the metallurgical industry of Spain, with particular reference to the steel, iron and alloy industries].—Revista Minera Aug. 1 1916; p 365; pp 3; Aug. 8; p 377; pp 3¾; 70c.

Molybdenum

Andrews, E. C.—*Molybdenite: Its Occurrence and Treatment in New South Wales*. [Abst. from Bulletin No. 23 of the N. S. W. Department of Mines].—Mg. & Engg. Rev. Aug. 5 1916; p 286; pp 2½; 35c.

Merrill, Frederick J. H.—*Geology and Mineral Resources of San Diego and Imperial Counties*. [Though gold is the principal metal mined, considerable is done in the non-metallic industry].—Calif. Mg. Bur.; pp 113*.

Nickel

Lotti, Alfredo.—*Notizie Complementari sulla Metallurgia del Nickel in America*. [Notes on the metallurgy of nickel in America].—Metallurgia Ital. July 15 1916; p 429; pp 4; \$1.

Thorium

Thornton, W. M., Jr.—*The Separation of Thorium from Iron with the Aid of the Ammonium Salt of Nitrosophenyl-*

hydroxylamine.—American Jnl. of Sci. Aug. 1916; p 151; pp 4*; 60c.

Titanium

Browning, P. E.; Simpson, G. S.; Porter, L. E.—*On the Qualitative Separation and Detection of Tellurium and Arsenic, Iron and Thallium, and Zirconium and Titanium*. [Details of procedure for this chemical method are given].—American Jnl. of Sci. Aug. 1916; p 106; pp 3; 60c.

Tungsten

Leslie, E. H.—*Tungsten in the Boulder District, Colorado*. [Speaks considerable of milling practice].—M. & S. P. Sept. 2 1916; p 353; pp 3*; 20c.

Uranium

Turner, W. A.—*The Separation of Vanadium from Phosphoric and Arsenic Acid and from Uranium*. [A description of a chemical method].—American Jnl. of Sci. Aug. 1916; p 109; pp 2; 60c.

Vanadium

Clark, W. W.—*The Manufacture and Use of Alumino Vanadium*. [On the alloys of these two metals].—Trans. American Inst. of Metals Vol. IX; p 159; pp 8; 35c.

Grider, R. L.—*Concentration and Smelting of Vanadium Ore*. [A flow sheet and description, with results obtained from lead-vanadate ores in New Mexico].—M. & S. P. Sept. 9 1916; p 389; pp 2½*; 20c.

(II) NON-METALS

(A) FUELS

Coal Fields and Mining

Lowell, F. L.—*Mines and Mineral Resources of Del Norte, Humboldt and Mendocino Counties, California*. [Reviews operations in detail, locates separate deposits and describes them].—Calif. Mg. Bur.; pp 59*.

Coke

— *Boilers Heated by Coke-Oven Gas*. [Drawings of installations are shown and method of operation described].—I. & C. Tr. Rev. Aug. 25 1916; p 213; pp 3¾*; 35c.

— *Thrislington Colliery's New Coking and By-Product Plant, Durham, England*.—I. & C. Tr. Rev. June 23 1916; p 717; pp 1*; 35c.

Coal and Coke By-Products

Rakuskin, M. A.—*Ueber die Fortschritte der Naphthologie in Russland im Jahre, 1913*. [On the oil industry in Russia in 1913, including the production of by-products from petroleum].—Petroleum Oct. 21 1914; p 57; pp 4½; Nov. 4 1914; p 98; pp 3½; \$1.20.

— *Boilers Heated by Coke-Oven Gas*. [Drawings of installations are shown and method of operation described].—I. & C. Tr. Rev. Aug. 25 1916; p 213; pp 3¾*; 35c.

Peat

Anrep, Aleph.—*Investigation of the Peat Bogs and Peat Industry of Canada, 1913-1914*. Each bog-area is described separately and grouped by provinces in which they are located. Notes on foreign peat production are given.—Canada Dept. of Mines, Mines Branch Bull. 11; pp 185*.

Irinji, Arnold.—*Die Physikalisch-chemischen Vorgänge bei Verdampfung von Heizöl mit Besonderer Rücksicht auf die Verwendung von Oelfeuerungen in Giesserei-Ofen*. [On the physical and chemical properties and changes of oil

burned in metallurgical furnaces].—Petroleum Oct. 7 1914; p 9; pp 5½; 60c.

Petroleum

Reger, David B.—*The Possibility of Deep Sand Oil and Gas in the Appalachian Geo-Syncline of West Virginia*.—Bull. A. I. M. E. Sept. 1916; p 1709; pp 16*; 35c.

Ries, Heinrich.—*Economic Geology*. [A brief review is made regarding the industry and occurrence of each mineral, including metals and non-metals].—John Wiley & Son; book; pp 856*; \$1.

— *Baku Russian Petroleum*. [A review of operations and production in the district].—Petro. World Sept. 1916; p 426; pp 3; 35c.

— *Die Petroleumindustrie Russlands im Jahre, 1913*. [The petroleum industry and production in Russia in 1913].—Petroleum Oct. 7 1914; p 14; pp 2; 60c.

— *Russian Petroleum Company*. [Discusses operations for part of 1916, including profits, production and deep drilling].—Petro. World Sept. 1916; p 431; pp 3; 35c.

— *Trapping Gas from Oil Well*. [On a novel method for accomplishing the same].—Petro. World Sept. 1916; p 416; pp 2*; 35c.

Fuels, Miscellaneous

Gadd, C. J.—*Empleo de Carbon Pulverizado Para el Caldeo de los Hornos Siderurgicos*. [Abst. from the Jnl. of the Franklin Inst. on the use of powdered coal for fuel].—Revista Minera Aug. 8 1916; p 380; pp 3¾*; 35c.

Gadd, C. J.—*The Use of Powdered Coal in Metallurgical Processes. A Discussion of the Principles Involved*. [A paper read before the Mining and Metallurgical Section].—Jnl. of Franklin Inst. Sept. 1916; p 323; pp 39*; 60c.

(B) STRUCTURALS AND CERAMICS

Clays, Ceramics

Darton, N. H.—*Geology and Underground Water of Luna County, New Mexico*. [A very complete description of the geologic formation].—U. S. G. S. Bull. 618; pp 188*.

Farnham, Dwight T.—*The Application of Scientific Management to Burning Clay*. [Discusses methods for keeping tract of the results of operations under varying conditions].—B. & C. Rec. Sept. 5 1916; p 403; pp 5*; 35c.

Huac, A. J.—*Cost Accounting for the Clay Plant*. [Accounting forms are reproduced and description of systems using the same are given].—B. & C. Rec. Sept. 5 1916; p 417; pp 2½; 35c.

Concrete

— *Plantas para Mezclar Hormigon*. [Large plants for concrete mixing].—Ing. & Contrista Sept. 1916; p 29; pp 6*; 35c.

Sand and Gravel

Stone, R. W.—*Sand and Gravel in 1915*. [Gives tabulated production by states, states in which glass-sand was produced and weight of sand and gravel per cubic yard].—Min. Rec. U. S. II; pp 13.

Stone

Darton, N. H.—*Geology and Underground Water of Luna County, New Mexico*. [A very complete description of the geologic formation].—U. S. G. S. Bull. 618; pp 188*.

Ries, Heinrich.—*Economic Geology*. [A brief review is made regarding the industry and occurrence of each mineral,

including metals and non-metals].—John Wiley & Son; book; pp 856*; \$4.

(C) OTHER NON-METALS

Abrasives

Ries, Heinrich. — *Economic Geology*. [A brief review is made regarding the industry and occurrence of each mineral, including metals and non-metals].—John Wiley & Son; book; pp 856*; \$4.

Asbestos

McLaughlin, R. P.; Bradley, Walter C.; Brown, G. Chester; Lowell, F. L.—*Mines and Mineral Resources of Fresno, Kern, Kings, Madera, Mariposa, Merced, San Joaquin and Stanislaus Counties, California*. [Operations are included in separately describing mines, plants and unworked deposits].—Calif. Mg. Bur.; pp 220*.

Tucker, W. B.—*Mines and Mineral Resources of Amador, Calaveras, Tuolumne*. [Economic mineral products are reviewed by separate descriptions of deposits and mines, with some information on the condition of the country].—Calif. Mg. Bur.; pp 180*.

Eitumens

Bacon, Raymond F.; Hamor, William A.—*The American Petroleum Industry*. [In Vol. I the history and geology, etc., regarding oil wells is taken up, while Vol. II is on refining of oil].—McGraw-Hill Co.; books; Vol. I pp 446*; Vol. II pp 517*; \$5 each.

Feldspar

Watts, A. S.—*The Feldspars of New England and North Abbalacian States*. [Goes into the lithology of feldspar rocks in general and gives nature of deposits by states. Methods of testing for quality and concentration of rocks are given].—U. S. Bur. of Mines Bull. 92; pp 181*; 35c.

Fertilizer

Harris, H. W.—*Commercial Fertilizers in Germany*. [Considers the subject from a production and consumption view up to 1914].—American Fertilizer Sept. 2 1916; p 32; pp 2; 25c.

Ries, Heinrich. — *Economic Geology*. [A brief review is made regarding the industry and occurrence of each mineral, including metals and non-metals].—John Wiley & Son; book; pp 856*; \$4.

— *British Fertilizer Notes*.—American Fertilizer Aug. 5 1916; p 36; pp 3; 25c.

— *Basic Phosphate Fertilizer as a By-Product in Iron Smelting*. [A method used in connection with open-hearth smelting].—Chem. Eng. & Mfg. Aug. 1916; p 68; pp 1*; 30c.

Fluorspar

— *Great Britain, Special Reports on the Mineral Resources of*.—Geol. Surv. of England. Vols. III, IV, V; \$1.

Gems

Wagner, P. A.—*Economic Geology and Mineral Industry of Southwest Africa*.—S. Afr. Mg. Jnl. July 1 1916; p 311; pp 1; 35c.

Magnesite

Dolbear, Samuel H.—*Magnesite Production and Markets*.—M. & S. P. Aug. 1916; p 234; pp 2*; 20c.

Nitrates

— *Formation of Nitrate Deposits, Chile*.—M. & S. P. Aug. 26 1916; p 314; pp 1*; 20c.

Potash

Wells, Roger C.—*Experiments on the Extraction of Potash from Wyomingite*. [The mineral contains principally potash and alumina as a silicate].—U. S. G. S. Prof. Paper 98-D; pp 4.

Pyrites

Hopkins, P. E.—*Iron Pyrite Deposits in Southeastern Ontario, Canada*. [An economic geological treatise on the subject].—Bull. A. I. M. E. Aug. 1916; p 1361; pp 9*; 35c.

Quartz

Katz, Frank J.—*Silica in 1915*. [Takes up the uses of silica, its production in general and by states, with briefs on other important siliceous materials].—Min. Res. of U. S. 11:8; pp 6.

Soapstone

Diller, J. S.—*Talc and Soapstone in 1915*. [The usual account of production and conditions of the trade for the year].—Min. Res. of U. S. 11:9; pp 4.

Salines

Merrill, Frederick J. H.—*Geology and Mineral Resources of San Diego and Imperial Counties*. [Though gold is the principal metal mined, considerable is done in the non-metallic industry].—Calif. Mg. Bur.; pp 113*.

Ore and Metal Markets; Prices-Current

New York, Sept. 28, 1916.

Silver.—Quotations for silver per fine ounce at New York and per standard ounce at London for the week ended Sept. 27 were as follows:

	New York. Cents.	London. Pence.
Sept. 21.....	68 7/8	32 3/4
22.....	68 7/8	32 3/4
23.....	68 7/8	32 3/4
25.....	69 1/4	32 15/16
26.....	69 1/4	32 15/16
27.....	69 1/4	32 15/16

MONTHLY AVERAGE PRICES OF SILVER.

Month.	New York			London Standard Oz.	
	1916 High.	1916 Low.	1916 Avg.	1915 Avg.	1916 Avg.
January.....	57 1/2	65 1/2	56.775	48.890	26.875
February.....	57	56 1/2	56.765	48.477	27.000
March.....	60 1/2	56 1/2	57.935	49.926	27.080
April.....	73 1/2	60 1/2	64.415	50.034	31.375
May.....	77 1/2	68 1/2	74.27	49.915	34.182
June.....	68 1/2	62 1/2	65.02	49.072	31.038
July.....	65	60	62.94	47.519	29.870
August.....	67	25	64	47.178	31.25
September.....	48.68
October.....	49.285
November.....	51.713
December.....	65.038
Year.....	49.690

Difference in domestic and foreign prices explained by the fact that the New York quotations are per fine ounce; the London per standard ounce 8.925 fine.

Copper.—The largest single order for copper ever placed in the history of the industry has been written into the books of American copper producers. As stated in the Mining and Engineering World last week the order would be officially booked as the issue was being printed. The option taken by the allies was to expire Thursday night. On Saturday morning one of the leading figures in the copper trade issued an official announcement stating that the order had been placed. It calls for 200,000 tons of copper to be delivered in the first half of next year. The booking of this order has created a condition without parallel in the industry. The price obtained by the producers was 26 3/4 cts. per lb., making the total value of the transaction about \$125,000,000. Every producer who desired to partake in the business secured a share. Some producers did not avail themselves of this opportunity, feeling that a higher price will be obtained later on from general buying. The amount of 448,000,000 lbs. is slightly under half of what the total refinery yield will be in the first half of next year. After negotiations lasting 5 weeks the order is now closed. The price paid is 1 ct. higher per pound than the producers asked when dealings were first opened. As pointed out in these reports the allies had to buy copper and their orders had to come to this country. Producers showed their control of the situation by waiting until the allies met their terms. Buying of copper by England and France has not, however, been completed. There is now in the market an inquiry for 200,000,000 lbs. copper, also for the first half of next year, and this additional business may be closed before the end of the month.

Domestic business was also very large last week and following the placing of the big allied order domestic demand increased twofold this week. Producers reported that orders for 150,000,000 lbs. were taken last week, the bulk of this tonnage being for delivery next year. Naturally prices were advanced after the foreign business had been booked and domestic consumers who were credulous as to the foreign business had the combined incentive of higher prices and depletion of supplies for next year to compel them to cover requirements. Thus electrolytic for December advanced to 28 1/2 cts., while for the first quarter of next year sellers took business at 27 1/2 @ 27 3/4 cts., with business for the second quarter closed at 27 cts. These prices represent an advance of a half cent.

The situation in copper reflects no development indicative of an easing up in the restraint on producers. Conditions are

not favoring increased refinery yield and hopes for expansion in output are not so strong. "Tight as a drum" expresses the copper situation adequately. Demand for the fourth quarter is in itself very large, although producers are only able to take orders for December delivery. Spot and October electrolytic has advanced to 29 cts., while for November dealers took business at 28 3/4 cts. Spot casting copper has advanced to 26 3/4 cts., with some producers asking 27 cts. Casting copper for November and December is held at 26 3/4 cts.

At this writing 70% of the output for the first half of next year has been sold. A good portion of the copper to be produced in the second half of next year has been taken by domestic users, the price being left open. This all means that a 2,000,000,000-lb. output in 1917 need not cause concern as to whether the world can absorb this metal, with Germany out of the running. The situation is quite the reverse. Even a production of 2,000,000,000 lbs. will not be sufficient to meet the demand. Copper has finally reached a stage where pessimists have absolutely no firm ground on which to base their views. The market has been solidified.

It is needless to enlarge upon what has been said above. To be verbose in describing the situation does not add to its strength. Nor for that matter detract. The laconic assertions of four of the leading producers are, however, interesting, these statements being made after the receipt of the allied order. Said one, "Earnings, production and consumption will be record-breaking in 1917." Another, "The situation lacks precedent." The third, "It proves we were right in June when a reaction was looked for." And the fourth, "War or no war, it means at least three years more of prosperity for copper."

The London market has been strong since our last report, although as yet it has not shown any response to the immense business done here. This is not necessary, but copper factors like to see all things co-ordinate. Last week electrolytic at London advanced £2.

Exports of copper reported since the first of the month total 20,479 tons and indications are that the complete exports will come close to 30,000 tons. Imports of copper in July totaled 18,000 tons, making the seven months' imports 121,500 tons, as contrasted with 72,500 tons in the same period of 1915.

Quotations for copper per pound at New York for the week ended Sept. 27 were as follows:

Tin.—The market has been generally firm in the past week, with a fair amount of business done. Consumers who have been waiting for tin to decline below 38 cts. abandoned this attitude and bought freely for November, December and January arrivals, sellers reporting that incoming business was the best in several weeks. Prices responded to the improved demand by advancing about a half cent.

Spot Straits tin fluctuated between 38½ and 38¾ cts., being at the outside price at this writing. Spot Banka is quoted at 37¾ cts., while spot No. 1 Chinese is quoted at 37 cts. Straits tin for October delivery is quoted at 38½ cts. and for November and December arrival at 38¾ cts. For January, February and March arrivals sellers asked 38¾ cts.

Last week London quotations advanced £2 to £3 10s, but the decline on Friday almost completely eliminated these gains. Singapore closed the week £1 5s above the opening at £175.

Quotations for tin per pound at New York and per ton at London and Singapore were as follows:

Sept.	New York		London.	Singapore.
	Spot.	Sept.

Lead.—Canada and England have been the principal buyers of lead, although domestic business was not of small account. Producers are growing less inclined to part with forward production, but buyers are insistent and are ferreting out metal in face of the objections of sellers. Indications point to another advance by the A. S. & R. Co., but this probably may not come until next week and possibly not until the new month. The market has been less inclined towards premiums, but the situation reflects strength. Spot and October metal is extremely scarce, but fortunately for consumers, they are well covered for this period.

For November delivery there has been a very active demand, with business done at 7 cts. New York and 6.85 cts.

St. Louis, these being prices secured by independents. Incidentally it is reported that the leading interest has taken some large lines for October delivery at open prices and has also done a considerable business for November.

Canadian ammunition makers have taken over 3000 tons in the past week and are now in the market for 2500 tons. An English inquiry calls for 3000 tons. Japan and Russia are expected in the market very shortly. Spot is quoted nominally at 7 cts. New York and 6.90 cts. St. Louis, but it would be difficult to obtain standard brands at these prices. For October delivery sellers who are dealers offer at 7 cts. New York and 6.85 cts. St. Louis.

The London market has advanced in response to the strength on this side. Last week lead went up 5s in spot and 10s in futures, with further gains this week.

Quotations for lead per pound at New York and per ton at London for the week ended Sept. 27 were as follows:

Sept.	New York		London

Lead Ore.—Though blende remains at a low price in the Missouri-Kansas-Oklahoma district, the lead-ore market made another jump during the week ended Sept. 23, as during the previous week, and the general run of sales were up \$5 to \$75 per ton, though some few lots brought \$78. The production of 1,499,300 lbs. was nearly 50% lower than the previous week's production. The total for the year was 76,272,262 lbs., valued at \$3,187,911, while the week's production was valued at \$2,550.

Zinc Ore.—In the Missouri-Kansas-Oklahoma district all was at a standstill so far as the zinc-ore market was concerned. Prices still remained at \$65 to \$45, as during the other weeks of the month. Production for the week ended Sept. 23 was about as during the previous week, 13,071,190 lbs. This brought the total for the year to date at 478,287,120 lbs. The week's production was valued at \$365,981 and the year's, \$20,808,802.

Calamine.—Prices were up \$5 to \$35 and \$45 per ton. The production for the week was 1,285,325 lbs., valued at \$28,902. The year's production to date is 22,334,235 lbs., valued at \$74,680.

Spelter.—Demand for spelter subsided rather suddenly last week and prices as a result gave way. The developments in spelter and their failure to co-ordinate with copper are explained as follows: Consumers feared copper, but have no fear of spelter. Spelter need not be purchased well ahead, as production is ample to meet the demand. Therefore, while consumers have purchased copper for delivery 6 to 9 months hence, they have limited their spelter operations to the rest of this year except in a few cases where metal has been taken for the first quarter. The extent of the recession has been about ¾ ct. in spot and futures. Dealers who loaded up spelter in hopes of a very active market are now seeking to liquidate, which serves to accentuate the reaction. Spot has moved off to 9 cts. New York and 8¾ cts. St. Louis, while for the fourth quarter sellers are offering at 8½ cts. St. Louis. There is considerable buying of spelter to be done for the first quarter of next year, but this business may not come out until late in November, unless prices become very attractive. London also contributed to the easier tone with several declines, amounting to £2 in spot and futures last week, while at the opening of the current week spot moved off £2 and futures £1.

Quotations for spelter per pound at New York and per ton at London for the week ended Sept. 27 were as follows:

MISCELLANEOUS METALS.

Quicksilver.—Business has been of fair volume, with the tone of the market steady. Sellers continue to take orders at \$75 per flask for spot virgin. Imports from Mexico and Europe have been fairly large, while good receipts from the Pacific coast are noted. Generally the situation in quicksilver contains nothing that would indicate an early advance, although some sellers are disposed to see a recession due to increasing supplies.

Platinum.—There has been no change in the situation respecting platinum. Leading refiners quote hard metal at \$85 per ounce and soft metal at \$91 per ounce.

Antimony.—Demand for antimony has been very slack and sellers are openly offering at concessions. Some Chinese interests offered spot at 11 cts. and November arrival at 10 cts. duty paid. Consumers appear to be well supplied.

Nickel.—Business continues normal with prices repeated. Ordinary forms are held at 45@50 cts. per pound in ton lots, while electrolytic commands the usual 5 cts. advance.

Aluminum.—Some consumers have been in the market for 1917 requirements, but otherwise business has lacked

any new features. Spot No. 1 virgin ingots are quoted at 61@63 cts. per pound in ton lots.

Ferromanganese.—English makers are waging a determined fight to retain their trade in this alloy, but domestic producers are constantly securing business. Some consumers have been greatly pleased with domestic ferromanganese, it being stated that the phosphorus contents ran as low as 11%, whereas the English seldom drops below 25%. Sales of about 2500 tons were reported last week at \$165 furnace, with English makers quoting \$164 seaboard for 80%.

ELKTON MINE, CRIPPLE CREEK.

AJAX MINE, VICTOR.

The Roosevelt Tunnel and Cripple Creek Mine Operations

W. A. SCOTT.

The Roosevelt tunnel, being driven by the Cripple Creek Drainage & Tunnel Co., is already an economic factor in the mining operations of Cripple Creek district. Pumping operations are gradually becoming unnecessary as the tunnel is extended, except as to mines whose workings are deeper than the tunnel level, and in these few cases the pumping lift to this drainage channel is not great. Even those mines situated several thousand feet away from the course of the tunnel have been effectively drained, showing the existence of water channels in a basin capable of being dewatered through this deep tunnel.

The portal of the tunnel is in Gatch park, in Cripple Creek canyon. The tunnel has been driven a distance of 21,200 ft., and the distance from the present heading to the point of destination, in the Vindicator's Golden Cycle mine, is 7800 ft. The outflow of water is subject to considerable variation, but measurements taken on Sept. 1 showed a flow of 10,300 gals. per minute. The bore is 7 ft. high and 9 ft. wide. The base is taken up by an 18-in. gauge car track on one side, and a drainage channel 4 ft. wide and 2 ft. deep on the other side. The channel extends about a foot in depth below the base of the track bed, and is built up a foot above that bed by planks set upon edge in concrete, the entire channel being covered with planks. The pipe line for compressed air is laid on top of the covered channel, next to the tunnel wall.

The initial course of the tunnel was 15,000 ft. northeasterly to the El Paso mine, tapping its workings at a depth of 1500 ft. As soon as this group was reached, all broken rock resulting from tunnel driving was hoisted through El Paso shaft until the Elktion mine was reached last June; since then all dirt from the tunnel has been hoisted through Elktion shaft. The course of the tunnel from the El Paso to the Elktion was almost due east, the Elktion ground having been cut at a depth of 1650 ft., which was 92 ft. below the base of the latter's shaft. To make a connection with Elktion, a cross-cut was driven 47 ft. off the main tunnel to a point directly below the shaft, and from that point a raise was made 92 ft. to the shaft; this raise is of same dimensions as the shaft and becomes a part of it.

Compressed air for drills was supplied by compressors at the portal of the tunnel until the El Paso mine was reached; for the drive between the El Paso and Elktion, air from the El Paso compressors was used, and as soon as the Elktion was tapped, and connection made, the compressor of the latter plant was brought into use, and this service will be continued until the heading of the tunnel is advanced far enough to make the plant of some other mine available.

The breast of the tunnel at this time is about 1500 ft. east of the Elktion shaft, the course being easterly under the saddle between Battle mountain and Bull

hill, thence onward toward the Vindicator group. The strike of the tunnel is about 1500 ft. south of the Cresson shaft and 1800 ft. north of the Portland's deep shaft No. 2. It gives 1925 ft. depth on the Cresson group, measured vertically from the collar of the shaft; and it will cut the 2100-ft. level from the Portland No. 2 shaft, and the Vindicator's Golden Cycle shaft at 1950 ft. Direct drainage of Last Dollar, United Gold mines, some properties of Stratton estate, Granite group, and Vindicator shaft will be accomplished.

The tunnel work, under direction of C. H. Fuller, has been marked by excellent progress during the last 2 months, the average having been 400 ft. per month, by the use of two drills, with 8 men on a shift, working three shifts, breaking and hoisting 115 to 120 cars of rock in 24 hours, using 16-cu. ft. cars. In this work, the Ingersoll-Leyner Model 18 drills are being used.

The project was started in 1907 for the drive of 28,900 ft. Having driven 21,200 ft., and accomplished, thus far, what was desired in the matter of deep drainage for the major part of the district, the last lap of 7700 ft. seems comparatively free from discouragement. The Cripple Creek Drainage & Tunnel Co., which is pushing the project to a conclusion, is backed by the Portland, El Paso, Vindicator, Cresson, Elkton, Granite, United Gold Mines, Mary McKinney and other mines.

The Portland.

The mining operations of Portland Gold Mining Co. are under the superintendency of Frank Smal, assisted by Fred Jones. No. 1 shaft, 1700 ft. deep, and No. 2 shaft, 2000 ft. deep, are 700 ft. apart, the collar of No. 2 being about 150 ft. higher than that of No. 1. Ore is being mined on all levels, from the highest to the lowest, the gold and silver being in sylvanite, associated with iron sulphide. Each shaft has three compartments, two for hoisting ore and waste and one for air columns and electric cables. Both shafts are timbered with creosoted Oregon timbers. The workings, which are all connected, are practically free from water, having been drained by the Roosevelt tunnel after the El Paso-Elkton water channels were tapped.

Electric haulage has been in use some time on the 1700 and 1800-ft. levels, whereby ore in 1400-lb. cars is hauled to either shaft by storage battery locomotives, and dumped into ore pockets, from which it is loaded into skips for hoisting.

The Portland mill is situated high up on Battle mountain, in the vicinity of No. 2 shaft, and the ore destined for treatment in that mill is hoisted through that shaft.

The old haulage tunnel, which starts on the surface near the old Independence shaft-house, and runs 1800 ft. north to No. 1 shaft, cutting same at a depth of 260 ft., is being enlarged and will be equipped for electric haulage, the intention being to use 6-ton cars for hauling ore to the Independence mill, now owned

and being reconstructed and re-equipped by the Portland Co. Most interesting plans are being worked out by the Portland Co. and its staff of engineers and metallurgists for the mill referred to.

This company, like some others in the district, finds the matter of disposal of mill tailings an expensive problem. A large bulk of such tailings are already banked up in the ravine below the mill now under reconstruction, these being held back by a dam. To provide for the disposal of tailings to be discharged from this mill in the future, a wooden flume, 3700 feet long, 12 ft. wide, and 6 ft. deep, lined with half-section clay tile, is being laid on trestles, and extends

MOUTH OF ROOSEVELT TUNNEL.

from the upper side of the dam down the ravine to a pump station. The tailings are to be conveyed by gravity to end of the flume, but from that place they will be pumped through a metal pipe line over a hill and discharged upon low ground. The pumping will involve a lift of 160 ft.

The Cresson.

The mine of the Cresson Con. Gold Mining & Milling Co. is one of the phenomenal producers in the history of Cripple Creek district. Some months ago the property was transferred by purchase from Chicago owners to a Colorado syndicate, headed by

THE PORTLAND MILL AT VICTOR.

NOS. 1 AND 2 PORTLAND MINE SHAFTS.

GOLDEN CYCLE MINE, CRIPPLE CREEK.

VINDICATOR MINE IN THE FOREGROUND.

CRESSON MINE, CRIPPLE CREEK.

EL PASO MINE, CRIPPLE CREEK.

MARY MCKINNEY MINE, CRIPPLE CREEK.

ISABELLA MINE, CRIPPLE CREEK.

A. E. Carlton, C. M. McNeill and Spencer Penrose, the first named being president of the company. Richard Roelofs, superintendent under the old regime, is general manager under present ownership, and special credit is accorded him, not only for direction of the underground work, but for the economical handling of the property.

A report issued by the president, A. E. Carlton, on Sept. 7, showed a net production of \$250,000 between June 24 and Aug. 1, 1916. According to the same report, the estimated ore available in the mine on Aug. 1 was worth \$4,130,000, net; that is, this is the estimate after deducting freight and treatment charges. On Sept. 7 the company had \$1,064,745 cash on hand, and 100 cars of ore in transit, worth \$1,000 per car.

This property is at the foot of Raven hill, on the upper course of Eclipse gulch. It is being operated and further developed through a 2-compartment shaft, having a depth of 1640 ft. Equipment includes a steam hoist, an air compressor of capacity of 2000 cu. ft. free air per minute, driven by direct connection to a synchronous motor. This supplies power for 30 drills, including heavy drills and stopers.

The ore, when hoisted, is passed through washers and screens, the washings and screenings being shipped separately; the coarse ore is passed from trommels over a moving slatted picking belt, from which 6 men do hand-sorting. The washed and sorted ore is conveyed to shipping bins on the railroad track over a 2600-ft. aerial tramway. The mine is producing around 6300 tons of ore per month, of an average value of \$30 per ton. This ore is shipped to the Colorado City mills.

The ore bodies are found east of the shaft, cross cuts having been driven from each level to the ore. The ore occurs in segregated masses, a stope of \$30-ore opened on the 1200-ft. level being one of the largest ever seen in the district. This is a continuation of the ore body opened on the higher levels. This shoot has a length of 450 ft. and a width varying from 25 to 140 ft. Ore is being hoisted from five levels—one above the 1200, and three below it.

Attention was directed to the Cresson about a year ago by the discovery of a cave on the 1200-ft. level, from which \$1,000,000 worth of ore was shipped within 6 weeks. This cave was 25 ft. long, 20 ft. wide and 30 ft. high. It contained a big tonnage of high grade ore, broken by nature, and the walls, also, were lined with sylvanite ore of high grade.

The mine is operated on the filled-stope plan by the use of pillars. The workings are already drained by the Roosevelt tunnel. Supt. Roelofs has been identified with the property for nearly 10 years, and up to July, 1916, the Cresson dividends amounted to nearly \$4,000,000.

The Vindicator.

The Vindicator Con. Gold Mining Co. recently purchased the Golden Cycle mine, adjoining the Vindicator group, situated at the southern base of Bull

hill. The Vindicator and Golden Cycle shafts are probably 1500 ft. apart. The former has a depth of 1900 ft. and the latter 2200 ft. The Roosevelt tunnel, when it reaches Golden Cycle mine, will strike it at the 1900-ft. level, and this is one of the cases in which it will be necessary to pump water up to that drainage tunnel. The Vindicator and Golden Cycle are now operated as one property, and the pumping plant in Golden Cycle shaft serves to keep the entire group dewatered, the present volume of water raised to the surface being about 450 gals. per minute. There is a steam pump at the 1900-ft. station that discharges at the surface, and electric driven pumps at the bottom of the shaft lifts the water to the 1900-ft. station.

On taking over the Golden Cycle, the Vindicator Co. proceeded to build thereon and equip a flotation plant of 350 tons daily capacity, making use of the coarse crushing plant already on the property. The ore, after being reduced to 3-in. size in the old plant, passes by belt conveyor to a chute through which it is carried to hoppers in the new plant. The hopper feed discharges upon a conveyor, and thence into a 6-ft. Stearns-Roger ball mill having chrome steel balls; the product of this mill passes to a second ball mill of the same kind, the last product being 40 mesh. A Dorr classifier works in closed circuit with the second ball mill. The classifier overflow passes to a Dorr thickener. Following this will be oil flotation treatment in which two 6-cell Minerals Separation machines will be used for roughers, and one 6-cell machine for cleaner work. The rougher tailings will be partly dewatered and then stacked. The flotation product will be taken from the cleaner cells, the tailings from the latter being returned to the head of the mill. The ore here consists of gold tellurides, associated with iron sulphide, in a quartz and porphyry gangue. This plant is to be ready for operating in October.

The Vindicator Co., having no dump room near the plant for mill tailings, has installed equipment for depositing them 8000 ft. away, on the opposite side of a mountain spur. The tailings from the rougher cells go to a sump tank, from which they are pumped to thickener tanks, where they are so dewatered as to leave a consistency of equal parts water and sand. In this form it is forced by two Byron Jackson 2-in. centrifugal sand pumps through a 3-in. metal pipe to the dumping ground above mentioned, making a lift of 425 ft.

At the Vindicator shaft is a crushing, screening and ore-washing plant to treat the reject from the ore shipping bins, after the ore of shipping grade is sorted out. In this process the revolving trommels of 6-mesh and 40-mesh are used, the two screen products made running about \$13 per ton. The best values are obtained in the fines, and the screening reduces about 15 tons into 1 ton. The washings, which are worth about \$70 per ton, are dried by steam driers before being shipped.

The ore to be treated in the new flotation mill at

the Golden Cycle shaft is to be taken from the dumps of both mines; it is estimated to run about \$2.25 per ton.

On the operating staff of the Vindicator are: W. E. Ryan, general superintendent; J. H. Haynes, metallurgist; A. R. Minner, mill superintendent.

The Isabella.

This property is on the northeast slope of Bull hill. Clark G. Mitchell, superintendent during the last two years, states that the mine is producing 2000 tons of ore per month, averaging 1 oz. gold per ton. The 1915 production amounted to \$500,000, and the production for the first 7 months of 1916 was \$350,000 gross. The mine is operated through the Lee shaft, 1275 ft. deep, and the Empire shaft, 1140 ft., the two being 1200 ft. apart. There are 14 levels off the Lee shaft, and 9 off the Empire, the entire workings aggregating about 20 miles. The Lee is the main operating shaft, and is connected with the Empire by 5 levels. The air compressor, steel shops, ore bins and offices are at the Lee.

There are two principal veins, known as the Victor and Buenavista, the dip of both being away from the shafts. The opening of rich ore on both veins on the 1275-ft. level was the cause of satisfaction to the management, as some lean ground has been found on several levels above this. Considerable ore taken from the Buenavista stopes on and above the 1275 level sampled an average of \$100 per ton. A 150-ft. winze is being sunk on east Victor vein from the 1275 level and when that depth is reached a cross cut will be driven to the Buenavista vein, and also to the shaft.

The workings are drained, to a large degree by the pumping operations on the Vindicator group, on the opposite side of Bull hill. The small volume of water that comes into the sump at the bottom of Lee shaft is raised by a pump and is forced 400 ft. laterally, discharging into a vein where it disappears. The bottom of the Lee shaft is 1000 ft. higher than the lowest workings of the Vindicator group, so that mine drainage is never likely to be a serious problem with the Isabella. The Roosevelt tunnel eventually will drain all the Bull hill mines.

The Isabella has 30 to 40 sets of lessees, who work on a royalty basis. Some leases run 2 years, paying a graded royalty of 10% to 40%, the lessee paying all his own expenses except for hoisting waste. In other cases the split-check lease is in vogue, whereby the company furnishes the supplies, the lessee furnishing the tools and labor, and the mill check for the ore is split 50-50 for company and lessee. On either plan, the lessee does some development. For 1915 the company performed 1590 ft. of development and the lessees 15,600 ft.

Stoper drills are used for all purposes, the leasers desiring but one kind. In the drill work, blowpipes are used to clean out drill holes, throwing a mixed jet of water and air into the hole while the drill is in action, through a small steel tube. This keeps down the fine dust and makes more sanitary conditions.

The company is spending \$10,000 in the construction of new ore bins, and a screening and washing

plant at Lee shaft. The cyanide plant, on the hillside 500 ft. below Lee shaft house, has been remodeled and is ready for operation. It has a crusher, rolls, revolving screens and tanks for sand leaching. The plant will handle 75 tons per day, and is to treat ore running \$3 to \$4 per ton. A tunnel has been driven 300 ft. from the mill to the 110-ft. station in the shaft and mill ore is to be taken out that way.

Stratton Estate.

The Stratton Cripple Creek Mining & Development Co., owned by the Stratton estate and managed by F. M. Keith, has no less than 15 properties on Bull, Globe, Gold and Womack hills and on Poverty gulch. The most prominent of these are the Dearborn, Orpha May, War Eagle, Plymouth Rock and Abe Lincoln. Practically all are being operated under 1 and 2½-year leases, on a graded royalty basis. The American Eagle is the only one being operated by the company direct. Ore production is running a little in excess of 1000 tons per month.

Granite Group.

Granite Gold Mining Co., C. C. Hamlin, general manager, operates the Gold Coin, Granite, Dillon, Dead Pine and Monument mines in one connected group. These extend in one continuous series of workings from the center of Victor northerly into Battle mountain to the lines of the Portland and Ajax. The Gold Coin shaft is 1300 ft. deep, that of the Dillon 1690 ft. The Dillon is to be the main working shaft; the waste will continue to be taken out to Eclipse gulch through Gold Coin tunnel. New electrical equipment is being put in position at the Dillon for hoisting. The compressor there will be operated by the Gold Coin steam plant. Dillon shaft will be sunk 200 ft. deeper. Ore being produced now amounts to about 3000 tons per month, and this tonnage is increasing. The grade of ore is about \$25 per ton. D. L. McCarthy, Victor, is superintendent.

Mary McKinney.

This mine is in charge of I. D. Buckles, and the ore shipments reach a maximum of 1000 tons per month. The workings from the 1300-ft. shaft are drained by the Roosevelt tunnel, the level of which is 70 ft. below the 1200 level. The ore being mined comes from the 800, 1000 and 1200 levels.

Union Leasing Co.

This company has been operating the Gold Sovereign, under a lease which has about expired. From this mine 10,000 tons of ore per year has been shipped. The company has taken a long-term lease on the Gold Dollar mine, on Beacon hill. It has a 916-ft. shaft and considerable amount of lateral work. A new electric hoist has been placed in position and other equipment includes a 10-drill air compressor. This company's leasing operations, here and at Red Cliff, are under direction of C. G. Jackson, superintendent. The Mabel, Percy and Chester, at the latter place, are producers of copper, zinc, silver and gold ore, and equipment is being installed for using power drills. The ore will be shipped to Leadville.

A Detector to Locate Buried Iron Objects.

This device is an adaptation of the compass, to a new use, that of indicating the location of iron objects when buried in the earth, and hidden from view. It is arranged to be held in a vertical position instead of a horizontal and is more delicately balanced and adjusted than any compass. While the compass, delicate as it is, directs the commerce of the world, just so will this "detective" device direct one to the object of search when trying to find a valve box or iron pin, when "just out of sight." This detector has a highly magnetized, hardened steel needle delicately balanced on hardened pivots, between two jeweled bearings.

It is fitted into a white metal untarnishable case, with a silvered dial in a special cup receptacle, with a snap in beveled glass; has a screw stop which keeps out all dirt, and is provided with a soft iron pin, which

A UNIQUE DETECTOR.

by magnetism when not in use holds the needle free from vibration, thus preventing undue wear on the pivots. When this instrument is held vertical in a north and south line and free from any surrounding disturbances, the needle will lie approximately in a horizontal position, or parallel to the earth's magnetism.

Its use depends upon the fact that an iron stop box, valve box, surveyor's corner pin, or other iron object, when placed vertically in the earth becomes a magnet, the upper end being one of the poles of the magnet. If the device being held vertically and in a north and south line, is gently swung over a stop box, the top of the box being one pole of the magnet, will attract one end of the needle, and repel the other, and the needle will be caused to swing or dip from its horizontal position. It is this swing or dip of the needle that indicates the location of the stop box, or

other object. There is a little dip of the needle, and it is this dip which must be looked for.

In using the detector a good plan is to stand facing north or south; hold the instrument by the ring, the dial facing either east or west; one can by stooping over and with a long steady sweep of the arm cover easily 3 ft. at a swing, watching the needle while so doing. If the box is not located in the first strip taken, one would step to one side and cover the adjacent strip. Always swinging instrument close to the ground and as steadily as possible. If the box is deeply buried the deflection will be slight, if shallow the dip or vibration will be very pronounced.

With a little practice one is able in a short time to locate stop boxes, and iron stakes, which are covered to a considerable depth and which would necessitate hours of digging to find, and in many cases the ruining of a lawn, or tearing up of good streets. It is the size of an ordinary watch so that it can be easily carried and always at hand when wanted. No need of measuring when one has any idea of where the box is; it is quicker than measuring even when one has the figures.

Antimony Deposits in Alaska.

The considerable demand for antimony during the last year has stimulated the development of certain Alaskan deposits of ore of that metal, from which ore to the value of about \$74,000 was mined and shipped during 1915. Stibnite, the sulphide of antimony, has been noted at 67 localities in Alaska, but only a few of these have produced and marketed ore. In 1915 the production of antimony ores was begun at four mines in the Fairbanks and at two in the Nome district. All the operations were small and most of them consisted of digging out the rich ore near the surface by open cuts and of breaking and hand sorting it. These deposits form the subject of a report recently published by the Survey as Bulletin 649, a volume of nearly 70 pages, entitled "Antimony Deposits of Alaska," by A. H. Brooks. According to this report, the Alaskan antimony deposits may be divided into three principal groups—siliceous gold-bearing stibnite lodes, stibnite-cinnabar lodes, and stibnite-galena lodes. Each of the first two of these groups is further divided, according to structure, into fissure veins, shear vein deposits, and stockworks. These deposits seem to have been formed in a rather recent geologic age, probably at the time of the intrusion of certain tertiary igneous rocks, though no metalliferous lodes have been found in the tertiary sedimentary rocks.

Following is a formula submitted for an acid-proof lining for tanks: 10% litharge, 20% short-fiber asbestos and 70% sand. Mix to a plaster with 40° Bé. solution of sodium silicate. An application of acid after drying will "set" the cement and render it acid-proof.

Ore Sampling Conditions in the West

T. R. WOODBRIDGE.*

(Continued from page 538.)

In order to avoid many conditions that seem unsatisfactory in all methods of hand sampling, there are in use various devices that are placed in the line of the moving stream of ore and automatically divert for the sample a fixed proportion of the stream. These are known as mechanical or automatic samplers.

Many advantages are claimed for the mechanical system of sampling. Except for the cleaning of the machinery, the only hand labor required is for unloading the ore, and even this is avoided if the ore is delivered in dump cars. The operation is continuous, and if the plant is properly managed, the sample may be placed on the drier within a few minutes of the time required by hand methods for merely delivering the ore to the sampling floor for the first coning. The ore is not rehandled nor is it stored for various lengths of time near other samples from which it might easily be salted. The unmixed condition of the ore is less of a factor, and if the machine and general plant are correctly designed and constructed the work can be done at a much lower operating cost. With simple and proper precautions the susceptibility to error and manipulation existing in hand methods is eliminated.

An interesting fact is the universal use of the mechanical system by custom sampling plants. The nature of their work is such that these plants are in a position to compare their sampling systems with those of every other plant to which they forward ore. These comparisons are not only yearly or monthly averages, but are also those of individual lots or mixtures of several lots forwarded as one. A well-conducted custom plant makes a study of comparative returns from different smelters and mills and, to this end, frequently makes shipments of what are termed "split lots" of the same ore to two or more smelters or mills. It is not an uncommon practice for custom plants to resample several consecutive portions of the same lot of ore, which are then sent to as many different smelters or mills merely for a comparison of results. They are also constantly studying any change made at any plant with which they have business relations. For these reasons it is probable that a custom plant shipping regularly is better posted as to the reliability of certain methods than is the purchasing plant using them.

The custom plant does not buy all the ore that it samples, but usually does a large proportion of its business in what is termed "sampled-in-transit" ore; that is, ore which the mine sends to the custom plant to be sampled as a check on the sampling that is to be done later at the purchasing mill or smelter. Therefore, the preferable system for the custom plant would seem to be that which is most reliable under all circumstances.

Among the objections to mechanical methods are the greater initial cost of the plant, the heavy cost of renewals of machinery, the difficulty of cleaning thoroughly, the danger of flying dust from a dry, high-grade ore, and, more serious than all else, the fact that with an unscrupulous operator, machines may be and have been so built or arranged that a correct sample is impossible. Too much stress cannot be laid upon this feature of the mechanical methods. The combination of an incorrectly constructed machine and improper delivery spouts is a more serious cause of error than any hand method heretofore discussed. A cone may be improperly formed or the shoveling improperly done but, in both these operations, conditions may be inexplicably changed at any time and, on account of a surprising average of errors, a correct sample may result; whereas, with an improperly designed or adjusted machine and a discriminating delivery, there can be no hope for anything but error. This possibility and its application by many sampling plants in the past has given rise to most of the opposition to the general use of mechanical systems but, fortunately, exposure and agitation have made such practices almost as unsafe as the occasional placing of screens in the bottom of the elevators.

Devices for mechanical sampling operate on either of two distinct principles which separate them naturally into two classes—stationary devices which continuously divert certain fixed sections of the stream of ore for the sample, and moving devices which are so operated that during several fixed periods per minute they divert the whole of the moving stream of ore for the sample. These devices are commonly and more graphically described as those taking part of the stream all the time, and those taking all of the stream part of the time. The first class of the mechanical samplers now in use is represented by the whistle pipe and the bank or combination riffle.

Stationary Devices.

The whistle pipe, in combination with coning and quartering, is in use in a number of plants which are under one management.

The whistle pipe is a vertical iron pipe with five notched openings cut halfway through the pipe, each being placed at an angle of 90° ; measured horizontally, from the one immediately above. In these notches are rectangular pieces of steel, so placed that the top edge forms a diameter of the pipe. Above every notch is placed a cast-iron liner, so shaped that the lower end is smaller than the upper, which collects the ore in a smaller stream just before it strikes the dividing edge. When the ore is delivered to the top of the whistle pipe, it falls on the first diverting partition, which causes approximately half of it to leave the pipe and

*U. S. Bureau of Mines; excerpts from advance proofs, Technical Paper 86.

fall into the reject bin. The other half continues down the pipe until it strikes the second partition, set at right angles to the preceding one, where it is similarly divided. This process continues through five diverting partitions, so that the sample finally leaving the pipe represents one thirty-second of the original lot. The rejects from the five openings are discharged into the housing and are diverted by chute to the reject receptacle.

The advantages of this device are its low original cost, economy of operation, and the simplicity and rapidity with which it reduces the ore to such a small proportion of the original amount. A disadvantage is that there is no possibility of recrushing the ore until it has been reduced to one thirty-second of its original bulk. This makes it necessary to crush the whole lot to whatever degree of fineness is required by this small sample. As it is rather unusual to change a set of rolls or a screen for lots of small tonnage, it is probable that the crushing limit is that of the average large lot. A maximum size of particles which would be safe for a 100,000-lb. lot would tend to cause an error in a 20,000-lb. lot. Another possible source of error is that the rectangular piece of iron forming the partition is inserted on an angle rather than in a vertical position. As this partition wears, the dividing edge will recede toward the outside of the pipe and cause too large a proportion to go into the sample. If the feed is uniform, the error resulting may not be serious, but if the stream of ore has a tendency to segregate, a recession of the dividing edge may cause a serious error. Inasmuch as the device must be housed to prevent the escape of ore and dust from the reject, there is little or no opportunity for inspection during sampling, so that a temporary clogging at the sampling partitions could readily remain undetected for varying periods of time, thus forcing an undue proportion of the ore into either the sample or reject. The cast-iron liners tend to wear unevenly, the greater wear taking place where the coarse ore strikes, thus establishing lines of flow that might result in an improper division of the sample.

Bank or Combination Riffle.

The bank or combination riffle is in use in connection with the Vezin sampler in four plants. This device consists of five riffles set in one frame, the top riffle being placed over two lower ones, which are in turn followed by two more set below them. The ore is fed from a chute or hopper to the first riffle, where the stream is divided into a number of smaller streams, of which every other one falls on one side and the rest on the opposite side of the riffle. From the spouts on both sides of the first riffle the streams of ore impinge on inclined iron aprons, by which they are diverted to the two riffles. Four sets of streams flow from these two riffles, each set representing one-fourth of the original lot. Two of these unite and fall into the reject receptacle; the other two sets are diverted to two aprons and the two riffles, where they are again

divided into four sets of streams. Two of these sets unite and fall into the reject receptacle; the other two, each being one-eighth of the original lot, may be united or may be kept separate as original and duplicate samples. If the sample so produced is larger than desired, it may, with or without further crushing, be passed through a similar set of riffles, or it may be elevated and passed through the same set. This repetition may be continued until the desired weight is obtained. The riffles may be built in a rigid frame, or they may be hung with rods so that a workman may swing one or more of the sections across a falling stream of ore.

Among the advantages claimed for this device is the fact that it divides the original stream of ore into a large number of smaller streams before separation, thus avoiding the error possible in coning and quartering where only four cuts are made before separation. Further, it is easily operated and, as the ore is generally finely crushed when it reaches this point and is fed to the device without a long drop, the wearing of the dividing edges will be slow.

On the other hand, its construction is not simple, and great care is required in constructing the dividing partitions and preserving them in proper condition. There is danger of the partitions becoming clogged by damp ore, pieces of wood, or cloth, and as they are not easily accessible for examination, they may remain clogged and part of the riffle may for long periods of time take no sample or else an undue proportion of the ore may pass into the sample. In order to guard against this tendency, the riffles are frequently tapped with a hammer and may be seriously bent out of shape. The great disadvantage of all devices of this type is that, under nearly all conditions, a falling or sliding stream of ore acquires certain tendencies that are developed by the conditions surrounding its previous handling. For instance, if one side of a delivery chute is lower than the other, or if there is a decidedly low place anywhere in the bottom of the chute, the fine ore will seek that low point. If there are several such places or depressions, all will form lodging places for the sliding fine ore. If there is a straight delivery to the chute, the coarse ore will be more or less evenly distributed in its flow, but if there is an angle at any point in the delivery, the coarse ore will also be found to have regular lines of flow.

The uneven wear of the face of a set of rolls tends to deliver the crusher ore in separate streams and, at the same time, to segregate the coarse and the fine ore. An angled spout causes an evident segregation. In fact, any number of conditions may exist that make the delivery of a stream of ore anything but uniform. Therefore, it is possible, and highly probable, that one or more of the divisions may intermittently or regularly receive an incorrect proportion of the fine or coarse ore and the cause may be exceedingly difficult to detect. Correct samples may be nevertheless obtained on account of the compensating average of errors.

In the bank riffle the ore that slides down any one

of the small spouts tends to separate into different sizes as it impinges upon the small diverting apron. The finer and damper ore adheres to the apron surface for an appreciable length of time and, when it is finally dislodged, it drops into the nearest division in the succeeding riffle. However, another pile immediately begins to form, so that there is built up a series of pyramids which causes the rolling coarse particles to be diverted to both sides and consequently into certain divisions in the following riffle. The first diversion may cause a small and hardly appreciable error, but as the ore passes through three sets of riffles and may be re-passed one or more times, there may be a cumulative error which, especially in sampling high-grade ore, may seriously affect the final sample. This tendency is so well recognized that riffles are sometimes given a swinging motion, in order to break the lines of regular flow. However, as this correction in the regular process generally depends on the memory, convenience, or whim of the workman, it is at best spasmodic.

(TO BE CONTINUED.)

Hydrostatic Amalgamator.

Herewith is an illustration of the Hydrostatic amalgamator, manufactured and placed on the market by Hydrostatic Amalgamator & Supply Co., 415 Seventeenth street, Denver, Colo. The machine is built to handle the material from a 5-stamp battery, from 12 to 30 tons in 24 hours. It is also adapted to handle a proportional volume from tube mills, ball mills or

THE HYDROSTATIC AMALGAMATOR.

placer sand. While it is suitable for material as coarse as 12 mesh, its greatest efficiency in gold recovery is obtained in handling a finer product; the finer the pulp the greater the extraction. Its efficiency does not depend upon water pressure, but is a matter of a continuous flow.

In operating the machine must stand on the level, the amalgam plate being placed inside the receptacle,

the silvered side up; the mercury is so poured as to form a thin coating over the plate. When the pulp or placer sand is fed with the required flush of water it rises in the feed pipe to the height of the overflow, making a column of pulp and water, which eliminates foam and froth. The air being excluded from the mercury prevents oxidation. The pulp or sand, escaping from the feed pipe into the amalgamating receptacle, radiates from the smaller to the larger diameter, and the gold is caught on the plate and moved along and off the plate into the mercury around the outer edge of and under the plate.

By reason of the larger diameter of the discharge column the speed of the flow is much reduced and the overflow current is not strong enough to disturb the mercury or amalgam, the sand and concentrates being held in suspension and carried out by the flow. The hopper is not built up to gain pressure, a higher head being considered detrimental. In making the clean-up the hopper is taken off and the receptacle removed, and the idea is to provide extra receptacles and plates, so as to replace immediately those removed from the clean-up. It is recommended that the mercury in the amalgam be retorted to obtain exact results, as in some cases the finest particles of gold are known to pass out with the mercury in wringing. Some of these machines are now in use in California and Oregon.

Mining Laws of Korea.

The Governor-General of Korea has issued new mining laws to supplant those issued in 1906. These have been translated and they consist of 64 articles based on the mining law of Japan. The main feature of importance is that, in the future, foreigners, as individuals, will be prohibited from obtaining mining concessions in the country. The grant of mining interests by the new regulation is to be limited to Japanese subjects or lawful persons established in accordance with Japanese law. Mining rights already in existence and held by foreigners are not to be interfered with. Foreign juridical persons in order to succeed to such rights must become juridical persons established in accordance with Japanese law, and must have their head office in Korea. Priority of application will probably no longer ensure the grant of mining rights, although this is not expressly stated in the ordinance.

In the last fiscal year, ended June 30, according to statistics recently compiled, Alaska shipped through Seattle to the markets of the United States merchandise and precious metals valued at \$65,946,000, of which about \$17,000,000 consisted of gold and silver. The figures for the fiscal year 1916 were double those recorded for 1912.

Silica is, strictly speaking, the only acid refractory substance used. The others owe their acid character to the presence of silica.

Two Kinds of Loyalty from Employees.

LETSON BALLIET.

What we want, and expect, of our employes and workers is loyalty, efficiency, economy and results. We expect them to take proper care of their tools, not to waste supplies, nor time. We expect them to conserve power and powder. We want them to be punctual in starting work. We want them to work until the last minute of their day.

In fact, we even demand it, and penalize or discharge employes for failure to meet our demands.

In return for the above we give them a place to work, specify their tasks, and pay them wages. In most cases we give them full union wages, or the going wage scale.

We destroy the individuality of our employes, at a cost of results that might have been obtained, by specifying their tasks and kick if they accomplish it ahead of time.

Many employes know more about the execution of the work than their employers or bosses. You can hide your appreciation of satisfactory work by an employe—you can claim credit for efficient management on the result of his work—but you cannot conceal his ability from your competitors. Efficiency is so scarce that everybody is willing to pay well for it. Some bosses don't want a man who knows more than they do, and others want the best they can get.

When you fail to recognize the services of an efficient employe, you'll find that someone else will give him a rise in pay for his services. After you have lost his services you'll find the secrets and methods of your own business being used by your competitors.

If your employes are loyal to you, they expect that you will be loyal to them.

The profits of your business are not limited to a "union scale" of profits. You want all the profits that it is possible to get.

Cheap labor is the most expensive. It reduces profits.

Loyalty can be paid for only with loyalty. Ability and loyalty will come to the top, and if you don't pay for it with loyalty and proper compensation, someone else will. You'll find your best men going over to your competitors. It's cheaper to pay what is right than to struggle with incompetent men to compete against able, efficient competition. How many business enterprises would be flourishing today if they had been operated by competent men?

It is better to raise wages of good men than to raise competitors with men you have trained.

To demand loyalty and efficiency is all right—but if you expect to keep it you must give loyalty and remuneration for it.

Nowhere is this condition more apparent than in mining.

The employes know what the mine is working to

accomplish as well as you do. Yet they are hampered with "fool orders" that have exactly the opposite effect from that which was intended.

At one mine I saw an order posted on the bulletin board which read: "Drillers must not tear down, until 15 minutes before quitting time." This order forced the mining company to pay for time, instead of for the work that might have been accomplished in less time. There are a thousand reasons why such an order should never have been posted. Is such an order loyal to a man's ability? No. It simply is an order that states—"We want 8 hours' time for a day's pay regardless of ability."

At another mine I saw an order posted: "Stoppers must put in 16 holes in a shift." In this mine there were places where 20 or more holes could easily have been made by some men, yet no one ever put in more than 16 holes. If something caused a delay, the men shortened their holes, and called for 16 primers just the same, regardless of results to be obtained. In one place the stope opened out, and a new man put in 9 holes, which was amply sufficient to break all that could be broken. The shift boss came into the stope, and the man explained that "9 was enough." The shift boss replied: "I know it, but you had better call for 16 primers when you go to shoot."

In both these cases the individual ability of the men is absolutely destroyed—efficiency is impossible—while the men become mere machines to expend a given amount of energy or time, for a day's pay, regardless of results.

I am not advocating higher wage scales. If the wages were \$100 a day and the same method was employed the result would be no different. I am pointing out the personal equation of the situation, and that if you don't recognize the personal ability of your employes your competitor will. Loyalty of any employe to your interest demands loyalty from you to his interest. If you want results pay for loyalty with loyalty.

Flotation Oils—An instructive booklet has just been issued by the General Naval Stores Co., giving specific information on flotation oils. In this publication the "frothing" and "foaming" properties of various kinds of oils are discussed. Suggestions are given for combining them to produce the proper combination of physical properties to successfully treat a given ore. The book is a summary of the company's observations on oils as applied to flotation, both through letters from operating companies and investigators whose comments were invited and as a result of actual large scale tests conducted at mills in the west. The pamphlet will be mailed to those interested on receipt of request to the company at 175 Front street, New York city.

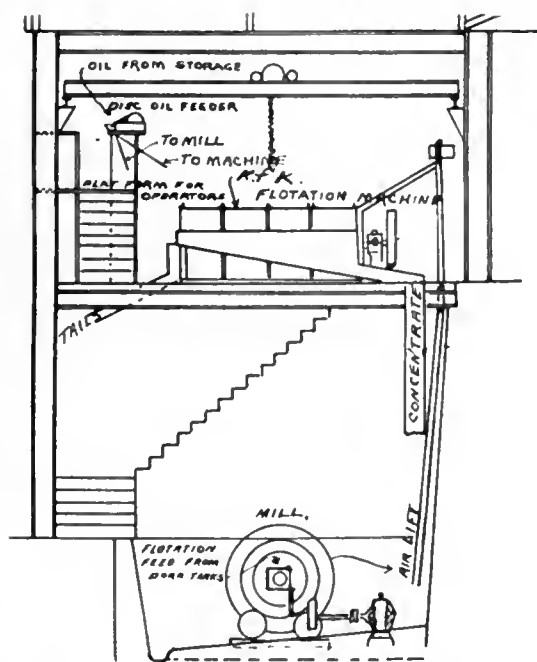

The electrolysis of solutions containing cyanide only produces cyanates, which have no solvent action on gold and silver.

Notes on Flotation in the Southwest

L. C. PENHOEL.*

The importance of flotation as an adjunct to the concentration of ores is well recognized. Mill designers are now giving the process due consideration and it is important that the flow-sheet be designed to permit good working conditions for the flotation plant. It is true that most of those in the southwest conducting extensive operations in concentration were working with the idea that they were doing good work, long before flotation was introduced or even thought of; and, in these cases, where the installation had to fit the mill, there is excuse for rather poor working conditions.

Time has been short since the general adoption of the process and such companies as Inspiration Con.

ARRANGEMENT OF THE MOCTEZUMA MILL.

were among the pioneers to build a plant, in which flotation plays an important part. It is well known that this mill is now doing very good work. It has illustrated the case of a low-grade concentrating ore being ground fine, in this instance to 48 mesh, before being treated by a concentrating machine and a good mill-saving being cheaply made.

In the newer mills, flotation has not done away with the vanners, as it was at first thought it would do and in applying it to the flow-sheet, it either precedes or follows the vanners.

Efficiency Being Studied. Mixture Used.

More attention is being paid to raising the general efficiency of the operation, namely, in giving more room and light, also more consideration is given to the feeding of the oils. The new concentrator of the Burro

*Southwestern Engineering Co., Los Angeles.

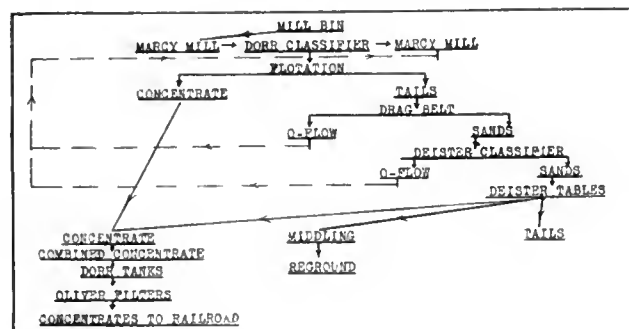

Mountain Mining Co., at Tyrone, N. M., and the flotation annex to the concentrator of the Moctezuma Copper Co., at Nacozari, are good examples. At the latter plant preparations are being made to treat at a considerable profit every 24 hours some 600 tons of material which heretofore went to the creek.

In general these plants use an oil mixture consisting of 60 to 80% coal tar, 10 to 20% creosote, 10 to 20% pine oil, and in quantities of from 0.4 lb. to 4 lbs. per ton of ore.

Insoluble content of concentrates run about 20 to 30%. Sixty to 80 mesh material is about the coarsest size permissible with good extraction. Copper sulphide contents of tailings are reduced to 0.15 to 0.4%.

Naturally, with those who were the first to make concentrates, of which a large part is produced by flotation, some points have shown up that can now be observed and used with profit.

Most important is the mechanical handling of such

FLOW SHEET OF INSPIRATION MILL.

concentrates in large quantity. This trouble always begins when the froth leaves the machine and it goes without saying that it is necessary to provide every possible means to insure against choke-ups. In the settling tanks, the trouble grows worse. At Inspiration, they have overcome this trouble in an ingenious way by using Dorr settling tanks.

Dewatering of Concentrates.

The thickened concentrates are best further unwatered by filter press, the Oliver being the one in general use. The product discharged from the filter generally contains from 12 to 18% moisture and it is best to convey it continuously from the filter by belt conveyor. Some precaution must be taken to clean the belt after discharging. Brushes are short lived and are generally replaced by scrapers. Also, scrapers are used on head and tail pulleys to keep the material from building up and causing the belt to run off.

Storage. Bin Designs.

In designing a bin for the storage of concentrates it has been found that, even in a bin with vertical sides

and a relatively large opening in the bottom, the concentrates will pack and arch, so as to give much trouble. One large company has designed a bin of rectangular section wider at the bottom than at the top and fitted with bottom discharge doors, in sections, so that the whole bottom can be dropped. Further precaution has been taken in making the bin small and its capacity will only be 50 tons.

Use of Oils and Reagents. Feeding.

At first, oil mixtures were scientifically concocted by the flotation expert, and, with a combination of five or six different kinds, he, perhaps, would have an "X" mixture which was a secret. With other reagents it was the same way, and it came to be accepted that

THE K. & K. FLOTATION MACHINE.

flotation work could only be entrusted to a trained chemist. Happily, this has all been greatly simplified and the promiscuous use of acids and other reagents, also seeking an oil for every ore, is a thing of the past. For this enlightenment we are indebted to the experimenter. The chemist and physicist have been rather behind in the development of the process. There is no doubt that their efforts will bear fruit and where the reasons are clearly explained, further developments may be expected. It is encouraging that there are some able men, who in their research work are trying to simplify and hold the explanation of a few physical laws.

In feeding oils and other reagents, it is necessary that exact quantities be fed continuously, and as these quantities are small, much trouble has been experienced in devising means to accomplish the results. A visit to the large plants reveals the ingenuity of all hands in this direction.

Types of Machines Introduced.

In reviewing the many attempts made to develop a flotation machine, one can readily see just how little is known regarding the part that the machine itself plays in the operation of producing a mineral froth. There are, perhaps, no operators, large or small, using flotation, who have not, at some time, experimented in the design of a machine. Original ideas were plentiful and the seeming simplicity of the process, when viewing a good flotation operation, gave the idea that any means of violent agitation would bring about the desired conditions. Nothing so far has come from

efforts to produce a machine of the purely agitation type, which promises any more than the original mineral separation machine. Straight agitation has not proved an economical means for introducing air into pulp, and, for the economical working of flotation, as the term is now understood, the aeration of the pulp plays an important part.

The next machine to come into use was that of the pneumatic type. This requires some pre-agitation to oil the pulp and effects the aeration of the pulp by introducing air under pressure. Several types of this machine are in use. In effecting the aeration of the pulp with this machine, the air is mechanically divided by introducing it into the pulp through some porous medium.

The last machine to be developed is alone of its type, and is known as the K. & K. flotation machine. It effects its results in an entirely different manner. Although it has been in successful operation for almost 2 years, it has only recently been brought to the attention of those interested in flotation.

Amalgamator with Self-Rotating Agitator.

Albert E. Vandercook, of Alameda, Cal., has designed a new form of amalgamator which consists of a tank with a mercury coated amalgamating plate in the bottom and a special agitator operating just above the plate. This agitator has a hollow rotating hub with hollow arms attached and nozzles at the ends of the arms. The illustration shows clearly how they are arranged.

The liquid carrying the finely ground ore and

AMALGAMATOR WITH SELF-ROTATING AGITATOR.

metallic particles is forced down through the arms and out of the nozzles against the amalgamating plate. The reaction of the discharging jets rotates the agitator. A high extraction is insured because the incoming slime is forced into intimate contact with the plate. He has assigned his patent to the California Macvan Co.

Graphite cathodes and anodes have given the best results, as they resist the action of the chlorine and acids better than lead plates, and do not warp with a high-current density.

Actual Costs of Mine Haulage by Horses and by Compressed Air

RAVUL GREEN.*

The following comparisons only apply to mines working under the following conditions: Seams pitching 25° or more; pit cars containing 2 or 3 tons; rails weighing 30 to 40 lbs. per yd.; grades fluctuating but little from 0.46 to 1.00', in favor of the loads; gangways roomy; tracks fairly well kept; curves few and slight.

Compressed Air Haulage.

An average summer month of 1915 was chosen for the test. The output was 33,826 tons, and the number of haulage shifts 19.5. All expense chargeable to haulage, including work done on idle days, holidays, and Sundays, has been allocated to that item. Two hundred* 3-ton steel cars were in use, equipped with 18-in. Hadfield wheels. The gangway was laid with 40-lb. rails. Besides the morning haulage shift, an afternoon and a midnight shift were employed. Only sufficient drivers were occupied on the midnight shift to fill all cars in preparation for the day shift, besides handling such supplies and material as are always needed in a coal mine. These extra hands being chargeable to haulage, tend to increase costs, especially if there are many idle days. All locomotives were of the H. K. Porter standard compound type. The haulage comprised two operations: Firstly, the gathering or loading from the mine chutes, and haulage to a main parting—the trips consisting of some 10 to 20 cars, with 6-ton locomotives; secondly, the haulage of 40-car trips, from the main parting to the tippie approach, by the use of 9-ton locomotives.

The monthly expenses amounted to: Track cleaners, drivers, trackmen, etc., \$2,335; power house labor, \$599; material repairs, cars, boilers, locomotives, \$426; coal and other supplies, \$1,238; total, \$4,598.

In order to obtain an accurate account of depreciation costs, the following items were taken from the equipment ledger: Charges for haulage, \$13,345 (being 50% proportion of \$26,690 cost of boilers, pumps, heaters, and headers); two compressors, \$25,000; eight locomotives, \$28,300; pipe lines, \$12,800; 200 cars, \$30,000; boiler and power house at 50% proportion charging haulage, \$5,000; total, \$114,445. Depreciation at 11% per year would equal \$1048 for 1 month. Ton miles handled for the month, 70,260. Cost per ton mile per item: Mine labor, \$0.033; powerhouse labor, \$0.007; material repairs labor, \$0.006; coal and other supplies, \$0.017; equipment 11%, \$0.015; total, \$0.078.

If a full month's run had been realized, that is, if the shipments had reached, say, 41,000 tons instead of 33,000, the theoretical cost would have been \$0.060

instead of \$0.078. However, it is doubtful if this figure would be reached in practice, as it is based on all the costs decreasing in the same ratio as the tonnage increases, which, in this case, is obviously untrue. For example, the mine labor, the material repairs, and the supplies increase practically in the same ratio as the tonnage. Again, the power house and equipment accounts are more or less fixed in their total, whatever the tonnage. Probably \$0.070 would be a very conservative figure to take in such an instance.

Horse Haulage.

The details of conditions under which the test was carried out were: Total tons shipped during the month, 15,573; days haulage worked, 25. The cars were steel framed, wooden boxes, of 2-ton capacity, 18-in. Hadfield wheels; rails, 40 lb. to the yard; tracks in fair condition—no sharp curves; grade quite uniform, averaging 0.5 of 1% in favor of the loads. An afternoon shift of drivers was employed in order to prepare a full string of loaded cars for the morning shift. Good heavy horses were used. The haulage consisted of two operations: First, hauling from the mine chutes by single horses to a main parting; second, hauling from the main parting to the tippie approach by means of a 3-horse spike team, 20 to 25 pit cars composing a trip.

The monthly expenses amounted to: Track cleaners, drivers, helpers, \$884; repairs to cars, etc., \$164. Supplies and attendance on 22 horses totalled \$330. Depreciation charges: For horses this figures as follows, averaging over a period of 5 years: Total horses owned, 83, value \$16,600. Less horses killed, 20, value \$4,000; loss on 28 horses sold, \$3,560; loss on value of balance, \$3,500; total, \$11,600. Loss in five years, 66%, or 13% per year.

Depreciation on horses: 22 horses at \$200 each equals \$4,400 at 13% yearly, for one month equals \$48. Depreciation on equipment: 130 pit cars at \$110 each equals \$14,300; stables, stable equipment, tools, \$2,966; total, \$17,266. Depreciation at 11% per year equals monthly \$167.

The total monthly expenses are therefore as follows: Labor, \$1,048; supplies, \$330; depreciation horses, \$48; depreciation equipment, \$167; total, \$1,593.

Total ton miles hauled, 14,450.

COMPARISON PER TON MILE.

	Compressed air.	Horses.
Labor	\$0.046	\$0.072
Supplies	0.017	0.022
Depreciation	0.015	0.015
Total cost.....	\$0.078	\$0.109

The conclusions to be deduced from the above

*Rocky Mountain Branch, Canadian Mining Institute.

facts are that: First, compressed air haulage is about 3 cts. per ton cheaper than horse haulage; second, cost of supplies and depreciation are about the same in each case; third, compressed air permits of from two to three times as much coal (in certain cases probably more) being handled than by horse haulage; fourth, the main reason for lower cost by compressed air is due to the labor item, in this case about 3 cts. per ton; fifth, the total of 7.8 cts. per tons for compressed air haulage could undoubtedly be reduced to 7 cts. for a month of 25 working days.

Six Months' Metal Production of Ontario, Canada.

Returns of production for the first 6 months of 1916, made to the Ontario Bureau of Mines by the metalliferous mines and works of the Province, are summarized in the following table, which also gives comparative quantities and values for the corresponding period of 1915.

	Quantity		Value	
	1915.	1916.	1915.	1916.
Gold, ozs.	173,021	235,060	\$3,570,072	\$4,822,740
Silver, ozs.	11,101,909	10,267,743	5,188,763	6,188,269
Copper, lbs.	77,795	14,368
Cobalt (metallic), lbs.	121,817	103,677
Nickel (metallic), lbs.	13,933	5,899
Molybdenite (concentrates), lbs.	12,631	13,075
Cobalt and nickel oxides, lbs.	141,500	401,408	56,812	204,638
Copper in matte, tons.	8,523	11,426½	1,704,800	2,285,096
Nickel in matte, tons.	15,182	20,651½	7,591,000	10,325,766
Iron ore, tons.	134,077	80,698	288,296	243,268
Pig iron, tons.	225,940	295,349	2,856,040	4,424,496

The production for the 6 months ending June 30, 1916, shows a material increase in value of all metals over that for the first 6 months of 1915, with the single exception of iron ore.

Gold.—If the present rate of production is maintained, Ontario should reach the \$10,000,000 mark for the year, as compared with \$8,500,000 for 1915. Of the total yield the Porcupine camp contributed all with the exception of \$545,434 produced by the Croesus in Munro township, the Rognon near Dryden, the Tough-Oakes at Kirkland Lake, and the Canadian Exploration Co. at Long Lake near Sudbury. The Hollinger Con. and Dome Mines are the big producers of the Porcupine camp. Before the year is out Boston Creek will probably be contributing to Ontario's gold production. Development is proceeding on some of the more promising claims at Kowkash (situated east of Lake Nipigon) on the National Transcontinental railway.

Silver.—Since the beginning of 1916 the price of silver has advanced considerably, the average being 62½ cts., low 56½ and high 77¼ cts. As a result production has been stimulated, and the value as compared with 1915 figures shows a considerable increase. Although the quantity sold was less than for the corresponding 6 months' period of 1915, the total production was greater, over 1,000,000 ozs. remaining to be marketed. Undoubtedly the life of the Cobalt camp will be prolonged as a result of introducing flotation treatment for handling low-grade dumps and slimes. Nipissing still leads in output with a valua-

tion of \$1,766,561. The Mining Corporation of Canada (Cobalt Lake and Townsite City) is the next large producer, followed by Kerr Lake, Coniagas, McKinley-Darrah-Savage, Secena-Superior, etc., in the order named.

Cobalt.—With the outbreak of war the European market for cobalt oxide was suddenly cut off. However, new markets and new uses for metallic cobalt have improved the situation. High-grade steels are now produced from cobalt alloys. Metallic cobalt production is greatly in excess of last year.

Nickel.—Metallic nickel from cobalt ores is produced at the refining works of the Deloro Smelting & Reduction Co., Ltd., formerly known as the Deloro Mining & Reduction Co. The output shows an increase over the 1915 production, which was not marketed during the 6 months' period.

Copper.—Apart from the nickel-copper deposits of Sudbury, there has been a revival of copper ore mining in Ontario, partly due to the high price of the metal. The old Tip Top mine and other properties near Mine Centre, in the district of Rainy River, are now producing. The Rand Syndicate is operating near Timagami. The Sable River Copper Co. at Massey has erected a mill and is using the flotation process for the treatment of copper ore.
